
7. In a lease-loom, the combination of the lay, and a drop shuttle-box provided with a box for holding a ground-filling shuttle, and a box for holding a shuttle which carries the binding-thread for securing the crossed warp-threads, and means attached to the drop shuttle-box to provide for the normal retention of the lay upon the protector-rod, when the shuttle is not thrown through the shed at the crossing of the grouped warp-threads.

8. In a lease-loom, the combination of the lay, and a drop shuttle-box provided with a box for holding a ground-filling shuttle, a box for holding a shuttle carrying the binding-thread for the crossed warp-threads, and a blank shuttle-box member provided with a projection representing a deflected shuttle-binder.

9. In a lease-loom, the combination of a drop shuttle-box provided with a box for holding the ground-filling shuttle, a box for holding the shuttle carrying the binding-thread for the crossed warp-threads, a blank shuttle-box, and a projection which represents a deflected shuttle-binder, with the shuttle-binder of the shuttle-box at the opposite end of the lay, the weft-fork, the grid and the guard-arm, arranged back of the grid, and connected with the shuttle-binder.

10. In a lease-loom, the combination of the reed, and the standard and deep harnesses held for operation in front of the reed, with the lay, and the deep-protecting rod attached to the lay to prevent the engagement of the deeps with the flying shuttle.

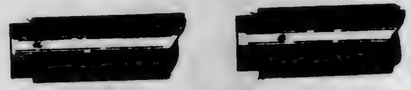
11. In a lease-loom, the combination of the reed, and the standard and deep harnesses held for operation in front of the reed, with the lay, the shuttle guide-bar provided with the guide-pins, and means for raising the pins into the shed at each backward movement of the lay.

12. In a lease-loom, the combination of the reed, and the standard and deep harnesses held for operation in front of the reed, with the lay, the deep-protecting rod, attached to the lay to prevent the engagement of the deeps with the flying shuttle, the shuttle guide-bar provided with the guide-pins, and means for raising the pins into the shed at each backward movement of the lay.

13. In a lease-loom, the combination of the reed for beating up the weft, the deep and standard harnesses arranged in front of the reed for crossing action upon groups of threads in front of the reed, and means for imparting movement to the deep and standard harnesses to effect the required crossing of the groups of threads.

708,952. PNEUMATIC TIRE AND PROCESS OF MANUFACTURING SAME. JOHN W. ROBERTS, Chicago, Ill., assignor, by direct and mesne assignments, to H. Tire Company, Chicago, Ill., a Corporation of Illinois. Filed Mar. 13, 1901. Serial No. 51,570. (No model.)

Claim.—1. As a new article of manufacture, a pneumatic tire having the tube of knit fabric embedded therein and its ends brought together and secured without overlapping by uniting the loops forming the ends of the tube; substantially as described.



2. As a new article of manufacture, a pneumatic tire having the tube of knit fabric embedded therein and its ends brought together and secured without overlapping by uniting the loops forming the ends of the tube by knitting them together; substantially as described.

3. As a new article of manufacture, a pneumatic tire having a tube of knit fabric embedded therein and its ends brought together and secured without overlapping by a cord passed alternately through the loops in the two ends; substantially as described.

4. As a new article of manufacture, a pneumatic tire having the tube of knit fabric embedded therein and its ends brought together and secured without overlapping by uniting the loops forming the ends of the tube by cords stitched through the loops; substantially as described.

5. In the art of making pneumatic tires, the process which consists of placing the tube of knit fabric over a tube of raw rubber; in joining the ends of the rubber tube and the ends of the fabric tube; in saturating the fabric and outer surface of the rubber tube with naphtha or some equivalent substance; in inflating the tire while still saturated to force the rubber through the meshes of the fabric; and in subsequently vulcanizing the tire thus formed; substantially as described.

6. In the art of making pneumatic tires, the process which consists of placing the tube of knit fabric over a tube of raw rubber; in joining the ends of the rubber tube and fiberizing the ends of the fabric tube; in saturating the fabric and outer surface of the rubber tube with naphtha or some equivalent substance; in inflating the tire while still saturated to force the rubber through the meshes of the fabric; in then applying additional layers of raw rubber; and finally in vulcanizing the tube thus formed; substantially as described.

7. In the art of making pneumatic tires, the process which consists of placing a tube of knit fabric over a tube of raw rubber; in joining the ends of the rubber tube and fiberizing the ends of the fabric tube; in saturating the fabric and outer surface of the rubber tube with naphtha or some equivalent substance; in placing the tube in a tire-mold; in then inflating the tire very strongly while in the mold and while still saturated to force the rubber through the meshes of the fabric; and in subsequently vulcanizing the tire thus formed; substantially as described.

8. In the art of making pneumatic tires, the process which consists of placing a coating of raw rubber over a tube of vulcanized rubber; in then placing a tube of knit fabric over the raw rubber; in joining the ends of the rubber tube and the ends of the fabric tube; in saturating the fabric and the outer surface of the raw rubber with naphtha or some equivalent substance; in inflating the tire while still saturated to force the raw rubber through the meshes of the fabric; and in subsequently vulcanizing the tire thus formed.

9. In the art of making rubber tubes with fabric embedded therein, the process which consists of placing a tube of fabric over a tube of raw rubber; in closing the ends of the tube to make it air-tight; in softening the raw rubber by any suitable means; in inflating the tube while the rubber is still softened to force it through the meshes of the fabric; and in subsequently vulcanizing the tube thus formed.

708,953. PNEUMATIC TIRE AND PROCESS OF MANUFACTURING SAME.

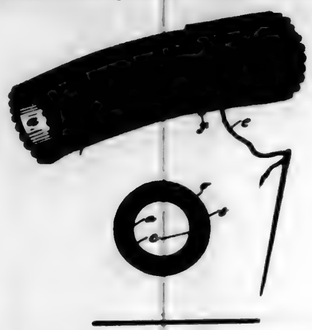
JOHN W. BLOSSETT, Chicago, Ill., assignor, by direct and mesne assignments, to H. Tire Company, Chicago, Ill., a Corporation of Illinois. Filed Jan. 9, 1902. Serial No. 88,920. (No model.)

Claim.—1. As a new article of manufacture, a pneumatic tire having a tube of knit fabric embedded therein and its ends brought together and overlapped and secured by uniting the loops of the telescoped end with the adjacent loops of the inner portion; substantially as described.

2. As a new article of manufacture, a pneumatic tire composed of inner and outer vulcanized tubes connected by a thick layer of vulcanized cement in which is embedded a tube of knit fabric having its ends brought together and secured by the loops of the fabric; substantially as described.

3. As a new article of manufacture, a pneumatic tire composed of inner and outer vulcanized tubes connected by a thick layer of vulcanized cement in which is embedded a tube of knit fabric having its ends brought together and telescoped and secured by uniting the loops of the overlapping end with the adjacent loops of the inner portion; substantially as described.

4. In the art of making pneumatic tires, the process which consists of covering the inner vulcanized air-tube placed upon a mandrel with a coating of vulcanized cement; of knitting a tube of fabric upon said cement-coated air-tube; of placing an additional layer of vulcanized cement upon said tube of fabric; in placing the tube thus formed in a tire-mold and inflating it strongly; in coating it with cement again after it is removed; and in placing an outer tube of vulcanized rubber thereon to be secured to the inner tube by said cement; substantially as described.



708,954. TIRE AND METHOD OF MANUFACTURING SAME.

JOHN W. BLOSSETT, Chicago, Ill., assignor, by direct and mesne assignments, to H. Tire Company, Chicago, Ill., a Corporation of Illinois. Filed Jan. 9, 1902. Serial No. 88,920. (No model.)

Claim.—1. As a new article of manufacture, a pneumatic tire having a tube of knit fabric embedded therein and its ends brought together and secured by uniting the loops of the ends and having the valve-stem passing through the fabric between the ends; substantially as described.

2. In the art of making pneumatic tires, the process which consists of placing the tube of fabric over a tube of raw rubber; in joining the ends of the rubber tube and the ends of the fabric tube; in inflating the tube in a tire-mold; in heating said mold sufficiently to soften the raw rubber so that the interior pressure will force it through the fabric thereby frictioning it; in placing a layer of raw rubber over the tube thus formed, and in subsequently vulcanizing the tire thus formed; substantially as described.

3. In the art of making pneumatic tires, the process which consists of placing a layer of raw rubber over an inner air-tube; in placing the tube of knit fabric over the raw rubber tube thus formed; in joining the ends of the rubber tube and the ends of the fabric tube; in inflating said tube in a tire-mold; in heating said mold sufficiently to soften the raw rubber so that the interior pressure will force it through the fabric thereby frictioning it; in placing a layer of raw rubber over the tube thus formed; and in subsequently vulcanizing the complete tire; substantially as described.

708,955. BASKET FORMING AND STAPLING MACHINE.

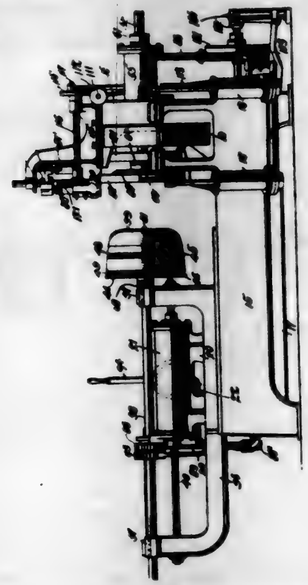
HOSMER B. BROWN, St. Joseph, Mich., assignor to St. Joseph Iron Works, St. Joseph, Mich., a Corporation of Michigan. Filed Mar. 4, 1902. Serial No. 96,661. (No model.)

Claim.—1. In a basket-making machine, the combination with a mold or form, of a pressure-plate, pressure-actuated devices tending to force the mold and plate toward each other, one of such devices exerting a force greater than that exerted by the other, and a stationary forming-ring through which the mold passes in the formation of a basket.

2. In a basket-making machine, the combination with a pair of cooperative basket-clamping devices one of which is shaped to form a mold for the basket, of fluid-pressure cylinders connected one to each of such devices, one of such cylinders being larger in area than the other, and a stationary forming-ring through which said devices are forced by the larger cylinder in the process of forming a basket.

3. In a basket-forming machine, the combination with a pair of basket-clamping means, one of which is shaped to form a mold for the basket, of a stationary forming-ring, and means for forcing the basket-clamps partially through said ring.

4. In a basket-forming machine, the combination with a basket-clamp and a mold for coöperation therewith, of a stationary forming-ring, through which the clamp and mold are forced, and means for actuating said clamp and mold.



5. In a basket-forming machine, the combination with a basket-clamp and a mold, of means for actuating the same, a clamping-ring adapted to engage with that portion of the basket between the hoops, and means independent of both the clamp and mold for the support of said ring.

6. In a basket-forming machine, the combination with mechanism for driving a double row of hoop-securing staples, of a basket-clamp, a mold, means for actuating the same, a clamping-ring adapted to engage with and hold the staves to the mold at a point between the two lines of staples, and means independent of both the clamp and mold for supporting said ring.

7. In a basket-forming machine, the combination with mechanism for driving a double row of hoop-securing staples, of a basket-mold, a pressure-plate coöperating therewith, and a clamping-ring arranged in a vertical plane between the staple-drivers, and means for forcing the pressure-plate and mold through said ring.

8. A basket-forming machine, comprising a plurality of laterally-fixed rotatable forming-rings, a mold, a pressure-plate adapted to engage the bottom of the basket-blank, and means for forcing the mold and pressure-plate through said rings.

9. A basket-forming machine, comprising a plurality of laterally-fixed forming-rings, a mold, a pressure-plate adapted to clamp the blank against the bottom of the mold, and means for forcing the mold and the pressure-plate through said rings.

10. A basket-forming machine, comprising a pressure-plate, means for exerting a constant pressure thereon, a laterally-fixed basket-forming ring, a basket-mold adapted to pass through said ring, and pressure-actuated devices exerting a force superior to that acting on the pressure-plate and serving to force the basket-blank and the pressure-plate through said ring.

11. In a basket-forming machine, a pair of basket-engaging elements, a fixed basket-forming ring for coöperation therewith, a pressure-cylinder connected to each element and one of such cylinders having a greater area than the other, a pressure-supply with which the smaller cylinder is in constant communication, and a valve-controlled passage leading from said pressure-supply to the larger cylinder.

12. In a basket-forming machine, a pair of concentrically-disposed basket-engaging devices, concentrically-disposed pressure-cylinders, a pressure-supply with which both cylinders are in constant communication, a basket-mold adapted to coöperate successively with said basket-engaging devices, a pressure-cylinder for actuating said basket-mold, said pressure-cylinder being of an area greater than the combined area of the said two concentric cylinders, and a valve-controlled passage leading from said pressure-supply to the mold-actuating cylinder.

13. In a basket-forming machine, the combination with a basket-mold having a concaved bottom portion, of a yielding ejector-pin carried by said mold and normally projecting beyond the outer line of the mold, a crimp-forming plunger between which and the pin the basket-blank is primarily engaged, a yielding pressure-plate adapted to engage with the basket-blank after the formation of the crimp, and a stationary forming-ring through which both the pressure-plate and mold are forced.

14. In a basket-forming machine, the combination with a basket-mold having a concaved bottom portion, of a yielding ejector-pin carried by said mold and normally projecting beyond the outer line of the mold, a crimp-forming plunger between which and the pin the basket-blank is primarily engaged, means for exerting pressure on the plunger to offset the formation of a central crimp in the blank, a pressure-plate having its engaging surface normally disposed to the rear of the crimp-forming plunger, a laterally-fixed rotatable forming-ring, and means for forcing the mold successively into contact with the crimp-forming and pressure plate.

15. In a basket-forming machine, the combination with a basket-mold having a concaved bottom portion, of a yielding ejector-pin carried by said mold and normally projecting beyond the outer line of the mold, a crimp-forming plunger between which and the pin the basket-blank is primarily engaged, a yielding pressure-plate adapted to engage with the basket-blank after the formation of the crimp, a pair of spaced forming-rings through which the pressure-plate and mold are forced with the basket-blank.

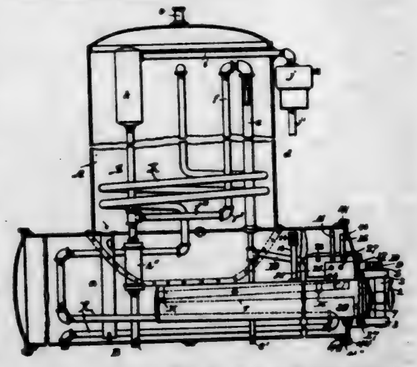
16. In a basket-forming machine, the combination with a reciprocatory basket-mold having a concaved bottom portion, of a basket-forming ring, a pressure-plate, a cylinder, a pressure-supply with which said cylinder is in constant communication, a piston disposed in the cylinder, a hollow piston-rod secured to the piston and to the pressure-plate, said hollow piston-rod forming an auxiliary cylinder in communication with the main cylinder, a plunger disposed within the auxiliary cylinder, a crimp-former carried by said plunger at a point in advance of the pressure-plate, and means for reciprocating the basket-mold to effect the successive engagement of the blank with the crimp-former, the pressure-plate and the forming-ring.

17. In a device of the class specified, two concentrically-disposed cylinders, each having a piston and piston-rod, the piston-rod of the larger cylinder serving as the smaller cylinder, basket-engaging devices carried by both of the piston-rods, and an auxiliary mold or form adapted to coact with said devices.

18. In a basket-forming machine, a frame, a stationary cylinder carried thereby, a piston in said cylinder having a piston-rod connected to the piston and extending through the opposite cylinder-heads, a carriage guided on the frame and connected rigidly to the opposite ends of said piston-rod, a shaft mounted in bearings in said carriage, a basket-mold carried by the shaft, and means for coöperating with the mold to effect the formation of a basket.

708,956. APPARATUS FOR GENERATING ACETYLENE GAS.

EDMUND R. COOK, Sacramento, Cal., assignor of one-half to George F. Hemmer, Portland, Oreg. Filed Apr. 27, 1901. Renewed Aug. 16, 1902. Serial No. 119,963. (No model.)



Claim.—1. In a gas-machine, the combination of a generator-chamber, a removable head for said chamber and a plurality of carbid-cylinders formed rigid with said head, a single valve interposed between the two cylinders, and provided with gas and water passages, gas and water

passages connecting the passages of the valve with said chambers, and means whereby the valve may be turned to open communication with one chamber and shut off communication with the other chamber.

2. In a gas-machine, the combination of a generator-chamber, a removable head therefor, a plurality of carbid-cylinders cast with said head, a turning plug axially mounted between said cylinders and provided with independent gas and water inlet and outlet ports or passages, gas and water inlet and water inlet and outlet passages leading from the plug to each cylinder, and means whereby the plug may be turned to open communication with one carbid-chamber and shut off communication with the other chamber.

3. In a gas-machine, the combination of a generator, a removable head therefor; a casting or lug rigid with said head and projecting into the generator-chamber; carbid-cylinders rigid with said head, one on each side of the vertical plane of said casting or lug; gas and water inlet and outlet passages formed in said lug and leading to each cylinder; a turning plug or valve mounted in said casting or lug, and circumferentially grooved to form passages or ports to connect with the said gas and water inlet and outlet passages in the lug or casting; and means whereby the plug may be turned to connect its passages with the corresponding passages leading to either cylinder, and simultaneously shut off the passages leading to the other cylinder.

4. In a gas-machine, the combination of a generator having a removable head, said head formed with a plurality of carbid-cylinders and an inwardly-projecting portion provided with oppositely-leading gas and water inlet and gas-outlet passages, one set of gas and water passages leading to each cylinder; and a single controlling-valve having gas and water ports or passages adapted to connect with the passages leading to one cylinder and simultaneously shut off communication with the passages leading to the other cylinder.

5. In a gas-machine, the combination of a generator; two carbid-cylinders contained in the same generator-chamber, and gas and water inlet and outlet passages formed in an inward extension of the head of the generator; and a longitudinally-extending turning plug or valve mounted in said extension and provided with ports or passages adapted to register with the inlet and outlet passages of each cylinder whereby a single valve controls the operation of each cylinder and one cylinder may be cut out without disturbing the operation of the other cylinder.

6. In a gas-machine, the combination of a generator; a plurality of carbid-cylinders contained in the same generating-chamber, the head of said chamber having an inward extension formed with gas and water inlet passages and gas-outlet passages, and one set of said passages communicating with each carbid-cylinder; and a longitudinally-extending turning plug or valve mounted in said extension between the cylinders and having peripheral ports or passages adapted to register with corresponding passages to and from each cylinder whereby the plug may admit water to, and exhaust gas from, one cylinder and then be turned to cut off this cylinder and establish communication with the other cylinder without interrupting the continuous operation of the machine.

7. In a gas-machine, the combination of a generator having a removable head said head provided with an inwardly-extending lug or casting with gas and water inlet and outlet passages formed therein; a plurality of carbid-cylinders in the single generator-chamber; a turning plug mounted in the lug or casting between two carbid-cylinders, and having peripheral ports or passages to connect with the water and gas passages to each cylinder; and a plurality of vertical tubes of unequal height whereby water may enter the shorter tube and be directed to one of said cylinders, and said plug may be turned into another position to establish connection with the longer tube and then admit water to the other cylinder, and cut out the first-named cylinder.

8. In a gas-machine, the combination of a generator and a plurality of carbid-cylinders therein; a removable head for the generator, said head having an integral inwardly-projecting portion formed with water and gas inlet and outlet passages; an inwardly-extending turning plug mounted in the head; and having gas and water ports: a longitudinal bolt having a countersunk head or passage and a gas-pipe connecting therewith: water-inlet pipes of unequal height; and means whereby the plug may be turned to establish communication with one carbid-cylinder and cut out another cylinder.

9. In a gas-machine, the combination of a generator and a removable head therefor; two carbid-cylinders within the same generator-chamber; a turning plug and water and gas passages therein and in the head and adapted to register to establish communication with one cylinder and cut out the other; a bracket secured on the outside of the head, and a screw mounted in said bracket and adapted to bear against the outer end of the plug substantially as and for the purposes described.

10. In a gas-machine, the combination of a generator; a removable head therefor, provided with a brace or bar: a carbid-cylinder; and a cover therefor having a projecting lug said brace-bar serving as a fulcrum for a tool adapted to engage said lug and loosen said cleaver.

11. In a gas-machine, the combination of a generator; a plurality of carbid-cylinders therein; a lug extending inwardly from the head of the generator and provided with water and gas passages for each cylinder; a seven-way valve in said passages between adjacent cylinders and controlling the passages to and from each, whereby the valve may be adjusted to establish communication with one cylinder and cut out the other cylinder, or cut out both cylinders; and a gas-pipe communicating with the gas-outlet passage of the valve.

708,957. LAMP. FRANK A. CURTIS, Hartford, Conn., assignor to Dwight T. Curtis, Boston, Mass. Filed Nov. 12, 1900. Serial No. 36,318. (No model.)

Claim.—1. In a lamp, in combination, an inclosing casing, an aperture through the bottom of the casing, a swinging trap located within the casing and adapted to close said aperture and having a flange adapted to support the trap in its opened position, and a pin projecting through the wall of the casing and adapted to strike the flange on the trap when the latter is raised.

2. In a lamp, in combination, an inclosing casing having an aperture through the bottom and means of access to a swinging trap, the swinging trap located within the casing and adapted to close said aperture and having a flange arranged to support the trap in its open position and overlie said means of access.

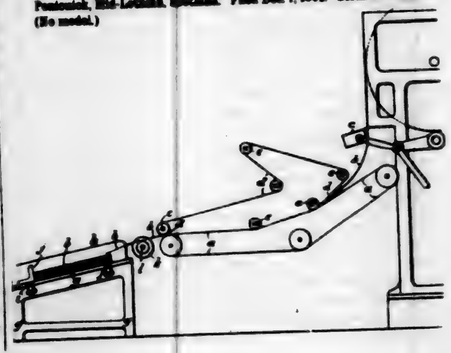
3. In a lamp, in combination, an inclosing casing, an aperture through the bottom of said casing, a trap pivoted in position to close said aperture and arranged to pass a vertical line in its opening movement, and having a flange arranged to provide a stop and to also serve as a means by which the trap may be closed.

4. In a lamp, in combination, an inclosing casing, an aperture through said casing, a trap arranged within the casing to close said aperture, and means normally disengaged from the trap and projecting from the inner to the outer side of the casing and adapted to engage the trap to cause its closing movement.

5. In a lamp, in combination, an inclosing casing, an aperture through the bottom of the casing, a trap arranged within the casing to close said aperture, and a pin normally disengaged from the trap and projecting through the wall of the casing and adapted to engage the trap to cause its closing movement.

6. In a lamp, in combination, an inclosing casing, an aperture through the bottom of the casing, a trap pivoted in position to close said aperture and having a flange and a movable pin projecting through the wall of the casing and adapted to strike said flange.

708,958. SHEET-DELIVERING APPARATUS. ALEXANDER COWAN, Penicuik, Scotland, assignor to Alex. Cowan & Sons, Limited, Penicuik, Mid-Lothian, Scotland. Filed Dec. 7, 1901. Serial No. 85,697. (No model.)

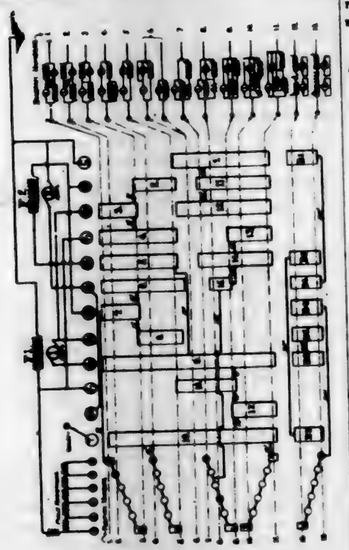


Claim.—A mechanism of the class described comprising an endless traveling apron adapted to receive the cut sheets, endless guide-tapes, a transverse rotatable shaft having a plurality of conical guide-rolls disposed to receive the sheets from the apron and a delivery-table having slots therein and upright partitions adjustably engaged in the slots and tapered at their ends to a thin wedge whereby compartments are formed, said compartments being arranged to receive said sheets.

708,959. HAIR-PIN. HENTON HARRISON, New York, N. Y., assignor of one-half to William Henry Laird, New York, N. Y. Filed July 11, 1901. Serial No. 67,288. (No model.)

Claim.—A hair-pin consisting of two arms tending to approach each other, said arms being in elongated contact throughout a portion of their length, whereby one or more hairs will always be clamped and the pin prevented from falling, substantially as described.

708,960. METHOD OF CONTROLLING ELECTRIC MOTORS. JOHN C. HENRY, Denver, Colo.; Susie A. Henry, executrix of said John C. Henry, deceased, assignor to Stanley Electric Manufacturing Company, a Corporation of New Jersey. Filed June 3, 1899. Serial No. 719,304. (No model.)



Claim.—1. A method of starting a pair of motors consisting of first placing them in parallel in opposite relation to each other, each armature being in series with the corresponding field and cross-connecting them so that each armature is in shunt with the field of the other motor.

2. A method of starting a pair of motors and increasing their speed which consists in placing them in parallel in juxtaposition with each armature in series with its own field, and establishing a cross connection of high resistance between the respective armatures and fields, and then decreasing the resistance of such cross connection so that each armature will be in shunt relation to the field of the other motor.

3. A method of protecting a pair of motors from the induced current ordinarily caused by breaking of circuit, which consists in maintaining in successive running positions a short circuit between the motors, whereby the said induced current will discharge through the low-resistance armature.

4. A method of controlling electric motors, which consists in placing each armature in series with the corresponding field-magnets in separate circuits, and cross-connecting from one of each circuits to the other at points between the armatures and fields, whereby the field of each of the separate machines is connected in shunt with the armature of the other machine, substantially as and for the purposes set forth.

5. A method of regulating a pair of motors, which consists in placing the armatures in series in one circuit, and the field-magnets in series in a separate circuit, gradually short-circuiting the field of one motor, short-circuiting and removing the corresponding armature, and then connecting it and its field in parallel with the armature of the other motor.

6. A method of regulating a pair of shunt-motors, which consists in connecting the armatures of said machines in series, and the fields of the machines in series, then dropping one of them from the circuit, and then connecting the armatures and fields of both motors in parallel.

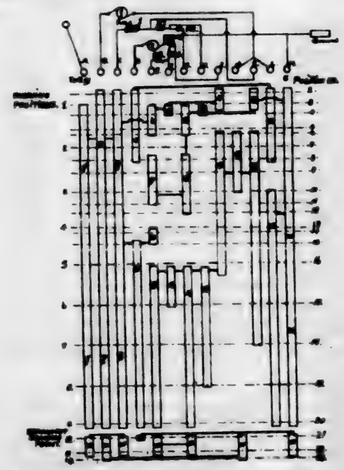
7. A method of regulating a pair of motors to change the armatures from series to parallel, which consists in partially exciting the fields of a motor before placing the armature of the other motor in parallel therewith, so that the current generated by the second armature is neutralized by that from the line.

8. A method of regulating a pair of motors, which consists in first connecting them with their armatures in series and with their field-magnets in series, increasing the voltage of one of the motors by removing the other motor from the circuit, exciting the fields of the second motor by a connection independent of its armature and of the other first motor, and then connecting the armature of the second motor in parallel.

9. A method of regulating a pair of motors to change their armatures from series to parallel, consisting in disconnecting one of the motors from the circuit, and connecting its field and subsequently its armature in parallel with the other armature.

10. A method of varying a pair of electric motors, which consists in first connecting the motor-armatures in series, then increasing the voltage of one of the motors by decreasing the voltage of its mate, subsequently removing the latter motor, then connecting its field and afterward its armature in parallel with the field and armature of the other motor.

708,961. METHOD OF CONTROLLING ELECTRIC MOTORS. JOHN C. HENRY, Denver, Colo.; Susie A. Henry, executrix of said John C. Henry, deceased, assignor to Stanley Electric Manufacturing Company, a Corporation of New Jersey. Filed Apr. 1, 1901. Serial No. 54,091. (No model.)



Claim.—1. The method of controlling a plurality of electric motors, whose fields are excited by a circuit independent of the armature, which consists in starting with the armatures in series and the fields in parallel and speeding up by changing the fields to series without breaking their circuit.

2. The method of changing the fields of a pair of motors from parallel to series, which consists in inserting resistances in the separate field-circuits to about equal that of the fields, establishing a cross connection so as to connect the fields and resistances together centrally, then withdrawing the resistance, leaving the fields in series.

3. The method of regulating a pair of motors, whose fields are excited by a circuit independent of the armature-circuit, which consists in weakening the field of one of the motors by shunting resistance around it to decrease the voltage of said motor, breaking the armature-circuit, allowing the current to pass through said field and resistance, in series with the other motor, and then short-circuiting said field and resistance.

4. The method of changing from series to parallel a pair of motors whose fields are excited by a circuit independent of the armature-circuit.

which consists in cutting out one of the armatures, increasing the current in the corresponding field, by establishing an additional path through resistance around the first field, and subsequently connecting the second armature to the circuit in parallel.

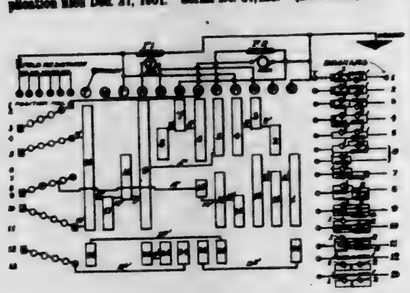
5. The method of connecting in parallel motors whose fields are excited by connections independent of their armatures, which consists in connecting the armature of one of the motors to the circuit, and strongly magnetizing the field of the other motor, subsequently connecting the armature of the second motor to the circuit and then weakening the fields of the second motor until its voltage corresponds with that of the first motor.

6. The method of retarding a motor whose field is excited by connection independent of its armature, which consists in first short-circuiting the armature, so that it may generate current under the residual magnetism of the field and subsequently increasing the magnetism of the field with current from the line.

7. The method of regulating a pair of motors which are connected in series, consisting in weakening the strength of the fields of one of the motors by establishing a shunt around it and then decreasing the resistance and increasing the current in the field of the other motor, and then open-circuiting the armature of the first-motor.

8. The method of changing the fields of a pair of motors from parallel to series, which consists in inserting resistance between one field and one side of the circuit and between the other field and the other side of the circuit, then cross-connecting them by a connection from the leaving-terminal of one field to the entering-terminal of the other field and then removing the resistance.

708,962. ELECTRIC VEHICLE. SUSIE A. HENRY, Denver, Colo., executrix of John C. Henry, deceased, assignor to Stanley Electric Manufacturing Company, a Corporation of New Jersey. Original application filed June 3, 1899, Serial No. 719,264. Divided and this application filed Dec. 27, 1901. Serial No. 87,620. (No model.)



Claim.—1. A controller for a pair of motors comprising contacts and connections adapted and arranged, in one position of the controller, to connect the motors in parallel, in opposite relation to each other, each armature being in series with its field, and in a succeeding position cross-connecting them so that each armature is in shunt with the field of the other motor and in series with its own field.

2. A controller for a pair of motors comprising contacts and connections adapted and arranged, in one position of the controller, to connect the motors in parallel, in opposite relation to each other, each armature being in series with its field, and in a succeeding position cross-connecting them so that each armature is in shunt with the field of the other motor and in series with its own field, a variable resistance in said cross connection, and contacts in the controller for regulating such variable resistance.

3. The combination with the two oppositely-connected series motors connected in parallel to the circuit, of a cross-connection between the motors, whereby a low-resistance path through the armatures is provided for discharges from the fields and the motors are protected from the induced current ordinarily caused by breaking of circuit.

4. A controller for regulating a pair of electric motors comprising contacts and connections adapted and arranged, in one position, to connect the armatures in series in one circuit and the field-magnets in series in a separate circuit, and in succeeding positions to gradually short-circuit the field of one motor, short-circuit and remove the corresponding armature, and then connect it and its field in parallel with the armature of the other motor.

5. A controller for regulating a pair of electric motors comprising contacts and connections adapted and arranged, in one position, to connect the armatures of the motors in series and the fields in series in separate circuits, and in succeeding positions to drop one of the motors from the circuit and to thereafter connect the armatures and fields of both motors in parallel.

6. A controller for regulating a pair of motors to change their armatures from series to parallel, comprising contacts and connections adapted and arranged in one position to connect one motor to but disconnect the other motor from the circuit, and in succeeding positions to partially excite the field of the disconnected motor, and to thereafter connect the armature of said latter motor in circuit in parallel with the field thereof, so that the current generated by the second armature is neutralized by that from the line.

7. A controller for regulating a pair of motors, comprising contacts and connections adapted and arranged, in one position, to connect the armatures of said motors in series and their field-magnets in series, and in succeeding positions, to increase the voltage of one of the motors by removing the other motor from the circuit, and to excite the fields of the second motor by a connection independent of its armature and of the first motor, and to then connect the armature of the second motor in parallel with that of the first motor.

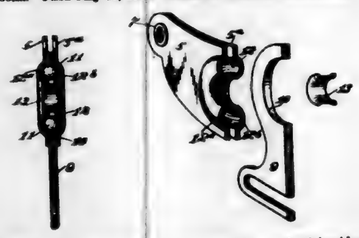
8. A controller for regulating a pair of motors to change their armatures from series to parallel, comprising contacts and connections adapted and arranged, in one position, to disconnect one of the motors from the circuit, and in succeeding positions to connect the field, and subsequently the armature of said motor, in parallel with the other armature.

9. A controller for regulating a pair of electric motors, comprising contacts and connections adapted and arranged to change the armatures from series to parallel relation and maintaining the field-magnets in parallel with the armatures when operating the armatures in series or in parallel.

10. In an electric vehicle, the combination with the motor, storage battery and controller, of an electric bell connected in circuit with the battery and motors, and responsive to overload on the battery.

11. In an electric vehicle, the combination with the motor and controller, of an electric bell arranged with a shunt in the circuit of the motor and responsive to overload thereon.

708,963. GARMENT-SUPPORTER. HENRY C. HIRE, New Britain, Conn. Filed July 16, 1902. Serial No. 115,801. (No model.)



Claim.—1. A pair of suspenders comprising a pair of shoulder-straps, a suspender-end, and a device connecting said straps to said suspender-end; said connecting device comprising a lever to whose opposite ends said shoulder-straps are connected, and a hanger to which said suspender-end is connected; said lever and hanger elements being formed of thin sheet metal, and one of said elements consisting of a pair of plates and the other thereof being inserted between said plates and having an eye, means coöperating with said eye to form a ball-race; a set of balls in said race; and means for retaining said lever, hanger and balls in coöperative relation.

2. A pair of suspenders comprising a pair of shoulder-straps, a suspender-end, and a device connecting said straps to said suspender-end; said connecting device comprising a lever to whose opposite ends said shoulder-straps are connected, and a hanger to which said suspender-end is connected; said lever and hanger elements being formed of thin sheet metal, and one of said elements consisting of a pair of plates and the other thereof being inserted between said plates and having an eye; a transverse fastener extending through said eye and connecting said plates, and the elements which compose said connecting device being so formed or stamped up and arranged as to form a ball-race, a part whereof consists of said eye; and a set of balls in said race.

3. A pair of suspenders comprising a pair of shoulder-straps, a suspender-end, and a device connecting said straps to said suspender-end, said connecting device comprising a lever to whose opposite ends said shoulder-straps are connected, and a hanger to which said suspender-end is connected; said lever and hanger elements being formed of thin sheet metal, and one of said elements consisting of a pair of plates and the other thereof being inserted between said plates and having an eye, and at least one of said plates having a struck-up annular depression which coöperates with said eye to form a ball-race; a set of balls in said race, and means for retaining said lever, hanger and balls in coöperative relation.

4. A pair of suspenders comprising a pair of shoulder-straps, a suspender-end, and a device connecting said straps to said suspender-end, said connecting device comprising a lever to whose opposite ends said shoulder-straps are connected, and a hanger to which said suspender-end is connected; said lever and hanger elements being formed of thin sheet metal, and one of said elements consisting of a pair of plates and the other thereof being inserted between said plates and having an eye, and said plates having similar struck-up annular depressions, and said depressions coöperating with said eye to form a ball-race; and a set of balls in said race.

5. A pair of suspenders comprising a pair of shoulder-straps, a suspender-end, and a device connecting said straps to said suspender-end, said connecting device comprising a lever to whose opposite ends said shoulder-straps are connected, and a hanger to which said suspender-end is connected; said lever and hanger elements being formed of thin sheet metal, one of said elements consisting of a pair of plates and the other thereof being inserted between said plates and having an eye, said plates having similar struck-up annular depressions, and said depressions coöperating with said eye to form a ball-race; a set of balls in said race; and a rivet passing through said eye and connecting said plates.

6. A pair of suspenders comprising a pair of shoulder-straps, a suspender-end, and a device connecting said straps to said suspender-end, said connecting device comprising a lever to whose opposite ends said shoulder-straps are connected, and a hanger to which said suspender-end is connected; said lever and hanger elements being formed of thin sheet metal, one of said elements consisting of a pair of plates and the other thereof being inserted between said plates and having an eye, said plates having similar struck-up annular depressions, and said depressions coöperating with said eye to form a ball-race; a set of balls in said race; a rivet passing through said eye and connecting said plates; and rivets connecting said plates at their ends.

7. A pair of suspenders comprising a pair of shoulder-straps, a suspender-end, and a device connecting said straps to said suspender-end; said connecting device comprising a lever to whose opposite ends said shoulder-straps are connected, and a hanger to which said suspender-end is connected; said lever and hanger elements being formed of thin sheet metal, said lever consisting of a pair of plates, and said hanger being formed with an eye and being inserted between said plates; means coöperating with said eye to form a ball-race; a set of balls in said race; and means for retaining said lever, hanger and balls in coöperative relation.

8. A pair of suspenders comprising a pair of shoulder-straps, a suspender-end, and a device connecting said straps to said suspender-end; said connecting device comprising a lever to whose opposite ends said shoulder-straps are connected, and a hanger to which said suspender-end is connected; said lever and hanger elements being formed of thin sheet metal, said lever consisting of a pair of plates, said plates having similar opposite struck-up annular depressions, and said hanger being inserted between said plates and having an eye which coöperates with said depressions to form a ball-race; a set of balls in said race; and means for connecting said plates.

9. A pair of suspenders comprising a pair of shoulder-straps, a suspender-end, and a device connecting said straps to said suspender-end; said connecting device comprising a lever to whose opposite ends said shoulder-straps are connected, and a hanger to which said suspender-end is connected; said lever and hanger elements being formed of thin sheet metal, said lever consisting of a pair of plates, and said hanger being formed with an eye and being inserted between said plates; means coöperating with said eye to form a ball-race; a set of balls in said race; means for retaining said lever, hanger and balls in coöperative relation; and a pair of chapes inserted between said plates at the ends of said lever and attached thereto.

10. A pair of suspenders comprising a pair of shoulder-straps, a suspender-end, and a device connecting said straps to said suspender-end; said connecting device comprising a lever to whose opposite ends said shoulder-straps are connected, and a hanger to which said suspender-end is connected; said lever and hanger elements being formed of thin sheet metal, and one of said elements consisting of a pair of plates and the other thereof being inserted between said plates and having an eye; means coöperating with said eye to form a ball-race; a set of balls in said race; means for retaining said lever, hanger and balls in coöperative relation; and a chape also inserted between said plates and pivoted thereto.

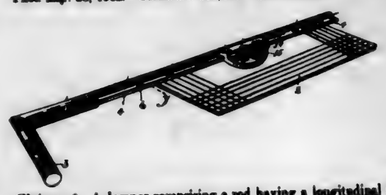
11. A pair of suspenders comprising a pair of shoulder-straps, a suspender-end, and a device connecting said straps to said suspender-end; said connecting device comprising a lever and a hanger, to the latter of which said suspender-end is connected; said lever and hanger elements being formed of thin sheet metal, said lever consisting of a pair of plates, and said hanger being formed with an eye and being inserted between said plates; means coöperating with said eye to form a ball-race; a set of balls in said race; a pair of devices connecting said plates at their ends; and a pair of chapes attached to said shoulder-straps and inserted between said plates and pivoted upon said connecting devices.

708,964. PENCIL AND THE ART OF MAKING SAME. LOUIS HOLLWORTH, Brooklyn, N. Y., assignor to Eagle Pencil Company, New York, N. Y. Filed June 19, 1902. Serial No. 112,314. (No model.)

Claim.—1. The improvement in the art of making pencils, consisting in applying to the same a plurality of thin superposed coats of varnish contrasting in color with one another, and then removing portions of the outer coat or coats to expose the coat of contrasting colored varnish immediately below, substantially as and for the purposes hereinbefore set forth.

2. As a new article of manufacture, a pencil having a plurality of thin superposed finishing varnish coats contrasting in color with one another, with portions of the outer coat or coats removed to expose the coat of contrasting color immediately below, as hereinbefore set forth.

708,965. DAMPER. CHARLES LOEFFLER, Salt Lake City, Utah. Filed May 28, 1902. Serial No. 109,479. (No model.)



Claim.—1. A damper comprising a rod having a longitudinal rib, a reversible apertured damper-plate fitted to the rod, its lower end lying flush with the outer side of the rod, a clamping-plate engaging the other side of the rib and having lugs projecting through the apertures in the damper-plate, and means for clamping the parts together.

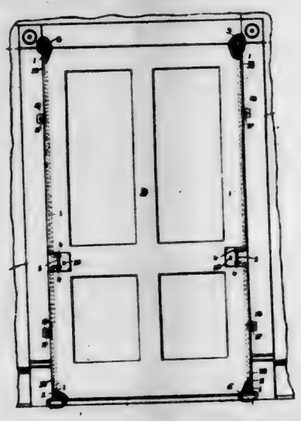
2. A damper comprising a rod having a longitudinal rib provided with recesses in each side thereof, a reversible apertured damper-plate having protuberances to engage said recess, a clamping-plate having protuberances to engage the recesses in the opposite side of the rib and having lugs projecting through the apertures in the damper-plate, and means to secure the parts together.

3. A damper comprising a rod having a longitudinal rib provided with recesses on each side thereof, a reversible apertured damper-plate having protuberances to engage said recesses, a clamping-plate having

protuberances to engage the recesses in the opposite side of the rib and lugs of greater length than the said protuberances, projecting through the apertures in the damper-plate and means to clamp the parts together.

4. In a damper, the combination of a rod having a rib and recesses formed in each side thereof, a reversible apertured damper-plate having protuberances to engage said recesses, a clamping-plate having lugs projecting through the apertures in the damper-plate and an offset edge provided with protuberances to engage the recesses in the opposite side of the rib, and means to hold the parts together.

708,966. SWINGING DOOR. HENRY MEYER, St. Louis, Mo. Filed Apr. 3, 1902. Serial No. 101,217. (No model.)



Claim.—1. In combination with a door, suitable hinge-bars carried in the line of the swinging axis of the door, and a door-closing device in coöperative connection with one of the bars, substantially as set forth.

2. In combination with a door, a pair of hinge-bars carried at either edge of the door, the outer ends of the bars being adapted to be received by sockets formed in the door-frame, a chamber located along the edge of the door, the adjacent or inner ends of the bars having inwardly-deflected portions confined within said chamber, transverse handle-bars at the ends of said deflected portions, suitable slots being formed in the opposite walls of the chamber for the free projection of said handle-bars, a spring coupled to the handle-bars for normally forcing them apart, a spring-actuated yoke for embracing the handle-bars when forced together, a latch projecting from the chamber and adapted to impinge against the jamb, and intermediate connections between the latch and yoke for disengaging the latter from the handle-bars upon the movement of the latch in the striking of the jamb, substantially as set forth.

3. In a swinging door having movable hinge-bars, a suitable casing, a stud forming part of the same, a rotatable disk mounted on the stud, means for effecting engagement between the disk and one of the hinge-bars, a spring having one end secured to the stud and the other to the disk, and means for tightening said spring, substantially as set forth.

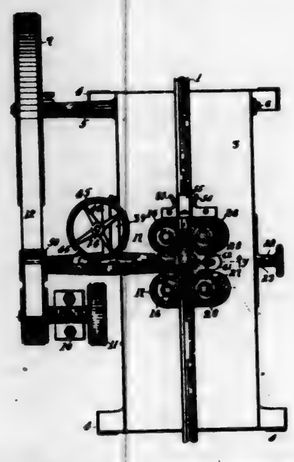
4. In a swinging door, a hinge-bar, a casing, a stud located at the center thereof, a rotatable disk mounted on the stud, a series of notches being formed in the disk, a series of teeth carried by the hinge-bar for engaging said notches, and a spring confined within the casing and having one end secured to the stud and the other to the disk, substantially as set forth.

5. In a door having suitable reciprocating hinge-bars, suitable hinge-lugs located in the path of the bars, and bearings in the door-jamb for the reception of the lugs, substantially as set forth.

6. In a swinging door, suitable hinge-bars, sockets formed in the door-frame for the reception of the outer ends of the bars, means carried by the door for retarding said bars, devices for automatically retaining the bars in their retracted position, and a latch for disconnecting the device which automatically retains the hinge-bars in their retracted position, substantially as set forth.

708,967. MACHINE FOR SMOOTHING RUBBER VEHICLE TIRES. STEPHEN S. MILLER and LEE B. CLOSSER, Akron, Ohio. Filed May 14, 1902. Serial No. 107,374. (No model.)

Claim.—1. In a machine of the class designated the combination of a supporting-table, feeding guide-rolls mounted on said table to force said tire lengthwise along said table, cutting means mounted above and below said table placed to engage said passing tires, substantially as shown and described.



2. In a machine for removing projections from rubber tires, the combination with a supporting-table, of pairs of guide feeding-rolls mounted on said table, means to cause the tires to slide along said table, a portion of said guide feeding-rolls capable of transverse adjustment with relation to said tires and the other rolls and means for removing projections on said tires simultaneously on both sides.

3. The combination in a machine for removing projections from rubber tires, of means for feeding the tires across a table, means for removing projections from said tires simultaneously on both sides, and means for adjusting the relative position of said mentioned means with relation to each other, substantially as shown and described.

4. The combination in a machine for removing projections from tires, of a table to support said tires, a number of pairs of guide feeding-rolls situated in such position on the table as to cause the passage of the tires between the members of each pair, means for increasing or diminishing the space between the members of each pair of rolls, and means mounted on said table for removing the projections from said tires simultaneously on both sides.

5. The combination in a machine for removing the projections from tires, consisting of cutting means situated in such position with relation to each other as to bear on opposite sides of the tire simultaneously, feed guiding-rolls mounted in bearings in said table, sprocket-wheels connected with said guide feeding-rolls and a sprocket-chain to cause said guide feeding-rolls to simultaneously revolve.

6. The combination in a machine for removing projections from rubber tires consisting of a supporting-table, cutting mechanism mounted on said table in such relative position thereto as to engage the surfaces of tires passing over said table, guide feeding-rolls mounted in bearings on said table, a portion of said guide feeding-rolls capable of adjustment, means for revolving said guide feeding-rolls simultaneously, and means for retaining said last-named means at an even tension at any desired adjustment of said guide feeding-rolls, substantially as shown and described.

7. In a machine for removing projections from rubber tires the combination with a supporting-table, mechanism for removing projections from tires passing over said table, a number of guide feeding-rolls mounted in bearings in said table, sprocket-wheels connected with said guide feeding-rolls, a belt or chain for simultaneously revolving said guide feeding-rolls, a swinging arm, an idler sprocket-wheel mounted on said arm, and means to cause the rocking of said arm to vary the tension on said chain or belt when the position of said guide feeding-rods is varied with relation to each other, substantially as shown and described.

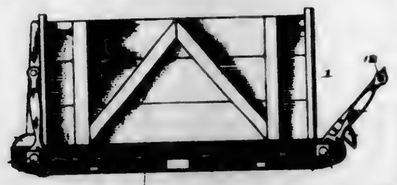
8. The combination in a machine for removing projections from rubber tires of a supporting-table, cutting mechanism situated with such relation to said table as to engage tires passing over said table, guide feeding-rolls mounted in bearings in said table, said guide feeding rolls adapted to press against one side of the passing tires, a sliding plate mounted in ways in said table, guide feeding-rolls mounted on said plate and capable of movement therewith, sprocket-wheels connected with said guide feeding-rolls, a sprocket chain or belt to cause a simultaneous revolution of said guide feeding-rolls, and means as a swinging arm, an idler sprocket-wheel to maintain the tension of said belt or chain during any adjustment of said sliding plate.

9. Movable guides to receive and permit the passage of tires of the class named having openings for the exposure of the portion of said tires containing "fins" in combination with revolvable grinding-wheels arranged to engage and remove said fins, substantially as shown and described.

10. In a machine for removing projections from rubber tires during their manufacture, the combination of means to support the tires simultaneously on both sides, means to feed said tire along said supporting means, cutting means to remove the projections from the tire, and supporting means to retain said tire in normal shape during such excision, substantially as shown and described.

11. In a machine for removing the projections from rubber tires during their manufacture, the combination of means to support the tire, means to feed said tires across said supporting means, means for cutting said projections, and supporting means to retain said tire during such excision, and means for forcing a current of air against said cutting means, at the point where such excision is taking place, substantially as shown and described.

708,968. WAGON-STANDARD. GEORGE HOOK, Bardstown, Ky., assignor of one-half to Charles T. Stewart, Bardstown, Ky. Filed Mar. 10, 1902. Serial No. 97,513. (No model.)



Claim.—1. A means for securing a wagon-bed removably to a bolster, including a wagon-standard having means by which it may be secured to said bolster, said parts being constructed and combined to permit the standard to be raised bodily and to move pivotally with relation to said bolster.

2. A wagon-standard having a footpiece to engage the wagon-bolster when the standard is in vertical position, and means for adjustably and pivotally securing said standard to said bolster, said means being such that the standard may be raised bodily to disengage the footpiece from the bolster and then turned pivotally.

3. A wagon-standard having a lengthened slot in its lower end and a footpiece above said slot, means extending through said slot for securing the standard to a wagon-bolster, said slot and securing means being such that the standard may be raised bodily and moved pivotally with relation to said securing means, and bracing means for said standard.

4. A wagon-standard having means by which it may be secured to a wagon-bolster, said parts being constructed and combined to permit the standard to be raised bodily and to move pivotally with relation to said bolster, and a footpiece which partakes of the movement of said standard and is constructed to bear upon said bolster.

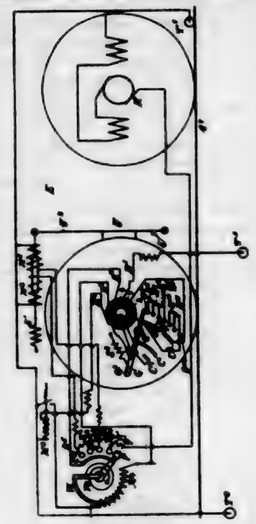
5. A wagon-standard having a lengthened slot in its lower end and provided above said slot with a lateral projection, braces pivotally secured at their upper ends to said standard and having elongated slots in their lower ends and a fastening-bolt which extends through said slots in the standard and braces and is so related to said slots as to permit the standard and braces to be raised vertically and moved pivotally upon said bolt.

6. A wagon-standard having a vertically-elongated slot at its lower end and provided above said slot with a lateral projection, combined with braces pivotally secured at their upper ends to opposite sides of said standard and having their lower ends formed with approximately L-shaped slots, a bolt passing through the slots in said standard and braces, and a fastening-nut on said bolt.

7. A wagon-bolster having a vertical slot, combined with a standard having its lower end located in said slot and provided with a vertically-elongated slot, said standard having a lateral projection above said slot to bear upon said bolster, braces pivotally secured at their upper ends to said standard and having approximately L-shaped slots in their lower ends, a bolt passing through said slots, and a fastening-nut on said bolt.

708,969. ELECTRIC RAILWAY. THOMAS B. MURRAY and JOHN VAN VLECK, New York, N. Y. Original application filed Nov. 23, 1901, Serial No. 83,313. Divided and this application filed Mar. 14, 1902. Serial No. 98,326. (No model.)

Claim.—1. In an electric railway, a track, a car adapted to travel on said track, an electrically-controlled brake mechanism on said car, fixed circuit-terminals placed at intervals along said track and in proximity thereto, and a selective device carried by said car whereby circuit may be automatically closed from any predetermined fixed terminal to the electric mechanism of said brake, and said brake thereby actuated.



2. In an electric railway, a track, a car adapted to travel on said track, an electrically-controlled brake mechanism on said car, a plurality of line conductors each communicating with a source of current disposed at intervals along said track and a circuit-closing device carried by said car and adjustable thereon to make contact with any one of said line conductors and thereby to close circuit through the electric brake mechanism of said brake to actuate the same.

3. In an electric railway, a track, a series of fixed circuit-terminals disposed at intervals beside said track and connected to a source of current-supply, an electrically-controlled brake mechanism on said car and a pivoted circuit-closing arm carried by said car; the said circuit-terminals being placed in different positions on an arc struck from the pivot center of said arm and the said arm being adjustable to make contact with any one of said terminals and thereby to establish circuit from said terminal to said brake mechanism to operate said brake.

4. In an electric railway, a track, a plurality of fixed circuit-terminals in proximity thereto, a car, an electrically-controlled brake mechanism on said car, and a circuit-closer on said car adjustable to close circuit through any one of said terminals and said brake mechanism and thereby automatically to operate said brake.

5. In an electric railway, a track, a plurality of fixed circuit-terminals in proximity thereto, a car, an electrically-controlled speed-regulating mechanism on said car, and a circuit-closer on said car adjustable to close circuit through any one of said terminals and said regulating mechanism and thereby automatically to modify the speed of said car.

6. In combination with a main-line conductor and a car provided with means for taking current from said conductor, an arm pivoted eccentrically on one of said car-wheels, a variable resistance controlled by said arm, and an electrically-actuated brake mechanism on said car having said variable resistance in circuit; whereby changes in position of said arm due to changes in centrifugal force dependent on the speed of rotation of said car-wheel shall cause a variation in the strength of the current actuating said brake mechanism.

7. In combination with a track and line conductor L', a car E adapted to travel on said track, having trolley T' running on line L', governor-arm G pivoted on a wheel of said car, retracting-spring l^9 on said arm, variable resistance on said wheel traversed by said arm, pivoted brake-arm U^3 and brake-shoe carried thereby, solenoids M' M^2 controlling said brake-arm U^3, and circuit connections between said resistance and said solenoids.

8. In combination with a main-line conductor, a car provided with means for taking current from said conductor, an arm pivoted eccentrically to one of said car-wheels, a variable resistance controlled by said arm, a driving-motor for said car and an electrically-actuated brake mechanism on said car, said motor and brake mechanism being in circuit with said

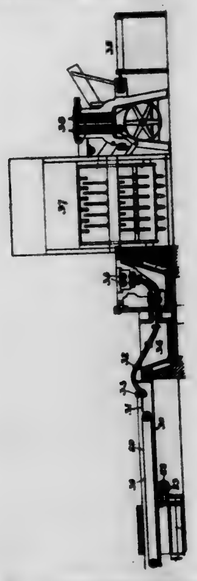
resistance; whereby changes in position of said arm due to changes in centrifugal force dependent on speed of rotation of said car shall cause a variation in strength of current operating said brake mechanism and said motor.

9. In an electric railway, a main-line conductor, a car provided with means for taking current from said conductor, and, on said car, an electrically-actuated brake mechanism, a motor, a controlling device constructed to control the current passing to both brake mechanism and motor and a current-changing centrifugal governor actuated by said car-wheel and operating said controlling device.

10. In an electric railway, a main-line conductor, a car provided with means for taking current from said conductor, and, on said car, an electrically-actuated brake mechanism, a controlling device constructed to control the current passing to said brake mechanism, and a current-changing centrifugal governor actuated by said car-wheel and operating said controlling device.

11. In an electric railway, a main-line conductor, a car provided with means for taking current from said conductor, means on said car for varying the strength of said current, a solenoid operated by said variable current, an electric brake mechanism and means controlled by said solenoid for actuating said brake mechanism.

708,970. APPARATUS FOR TREATING AND TINNING PLATES. JAMES R. PHILLIPS, Pittsburg, Pa., assignor to the American Tin Plate Company, Pittsburg, Pa., a Corporation of New Jersey. Filed July 10, 1901. Serial No. 67,778. (No model.)



Claim.—1. The combination with a tank arranged to contain liquid for treating plates, of tinning-pots in proximity thereto, mechanism for feeding the sheets through the liquid, and a switch device arranged to transfer the sheets laterally from the liquid to the tinning-pots; substantially as described.

2. A tank arranged to contain liquid for treating plates, a series of tinning-pots adjacent thereto, mechanism for feeding a series of plates through the tank, and switch mechanism arranged to feed the sheets successively to the different tinning-pots; substantially as described.

3. A pickling-tank, a swilling-tank arranged in tandem therewith, mechanism for feeding sheets successively through the tanks, a tinning-pot at one side of the swilling-tank, and transfer mechanism arranged to feed the sheets from the swilling-tank to the tinning-pot; substantially as described.

4. A trough arranged to contain liquid, mechanism for feeding plates through said trough, a series of tinning-pots arranged along said trough, switches arranged to transfer the sheets from the tank into the tinning-pots, and mechanism for operating said switches successively one after the other, to feed the plates to the different pots; substantially as described.

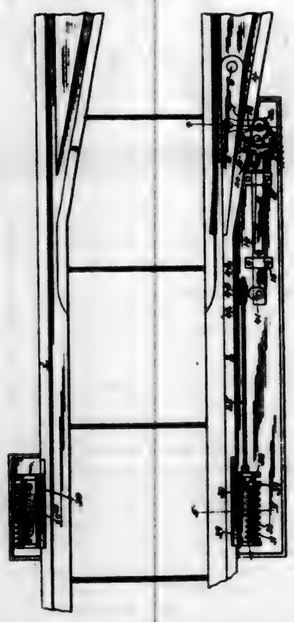
5. A tank arranged to contain liquid, mechanism for feeding sheets into and through said tank, a series of tinning-pots arranged at different points along the length of the tank, brauning and dusting apparatus adjacent to the tinning-pots, and mechanism for transferring the successive sheets from the tank successively to different pots, and feeding them through the pots and the brauning and dusting devices; substantially as described.

6. A tank arranged to contain liquid, mechanism for feeding sheets through the tank, a set of switch devices, tinning, brauning and dusting devices to which the switches lead, and a common feed-table to which the sheets are fed from the dusting apparatus; substantially as described.

7. A tank arranged to contain liquid mechanism for feeding sheets therethrough, transfer devices located at different points in the length of the tank, mechanism for actuating the switch devices successively, and indicating mechanism arranged to show the transfer mechanism which will act upon any particular sheet; substantially as described.

8. A pickling-trough, a swilling-trough arranged in tandem therewith, rollers for feeding the sheets successively through both tanks, tinning-pots arranged at different points along the swilling-tank, and switch devices arranged to engage successive sheets in the swilling-tank and transfer them to the several tinning-pots; substantially as described.

708,971. SWITCH-OPERATING DEVICE. FRANCIS E. QUIST, Knoxville, Pa. Filed Jan. 25, 1902. Serial No. 91,212. (No model.)



Claim.—1. In a railway-switch-operating device, the combination with a switch-point, of a horizontally-movable part lying in the path of a wheel or wheels of the car and adapted to be moved thereby when the rotation of the wheel is retarded, means for returning said movable part in its normal position after having been moved longitudinally by the car-wheel, and normally disconnected mechanism between the movable part and the switch-point, whereby successive movements of the movable part in the same direction will effect opposite movements in the switch-point, said connecting mechanism being constructed and arranged to complete the throw of the switch-point on the backward stroke of the movable part.

2. In a railway-switch-operating device, the combination with a switch-point, of a horizontally-movable part adapted to be actuated from a car, means for returning said movable part to its normal position after having been moved longitudinally, and normally disconnected mechanism between said movable part and the switch-point, whereby successive movements of the movable part in the same direction will effect opposite movements in the switch-point, said connecting mechanism being constructed and arranged so that when returned to its normal position it will hold the switch-point in the position to which it has been moved.

3. In a railway-switch-operating device, the combination with a switch-point, of a horizontally-movable part lying in the path of a wheel

or wheels of the car and adapted to be moved thereby when the rotation of the wheel is retarded, means for returning said movable part to its normal position after having been moved longitudinally by the car-wheel, a rocking lever connected to the switch-point, and means connected to the movable part and adapted to engage the rocking lever, whereby successive movements of the movable part in the same direction will effect opposite movements in the switch-point, said means being constructed and arranged to engage the rocking lever and complete its throw on the backward movement of the movable part.

4. In a railway-switch-operating device, the combination with a switch-point, of a rocking lever connected thereto and provided with two pair of studs or shoulders, one of each pair being on opposite sides of the longitudinal axis of the lever, a horizontally-movable part adapted to be moved longitudinally from the car, means for returning it to its normal position after having been moved longitudinally, and an oscillating head connected to said movable part and arranged to swing beyond its center in both directions, said head being arranged to engage on its forward stroke alternately with the studs or shoulders of one pair, whereby successive movements of the movable part in the same direction will effect opposite movements in the switch-point, said head having inclined or rounded faces on its rear side which on the back stroke engage alternately with the studs of the other pair to swing said head beyond its longitudinal center.

5. In a railway-switch-operating device, the combination with a switch-point, of a rocking lever connected thereto and provided with two pair of studs or shoulders, one of each pair being on opposite sides of the longitudinal axis of the lever, a horizontally-movable part adapted to be moved longitudinally from the car, means for returning it to its normal position after having been moved longitudinally, and an oscillating head connected to said movable part and arranged to engage on its forward stroke alternately with the studs or shoulders of one pair, whereby successive movements of the movable part in the same direction will effect opposite movements in the switch-point, said head being provided on its rear side with inclined or concave faces which slope toward the center of said head and which on the back stroke engage alternately with the studs of the other pair on the lever and move said lever to the limit of its throw.

6. In a railway-switch-operating device, the combination with a switch-point, of a rocking lever connected thereto and provided with two pair of studs or shoulders, one of each pair being on opposite sides of the longitudinal axis of the lever, a horizontally-movable slide adapted to be moved longitudinally from the car, means for returning it to its normal position after having been moved longitudinally, and a comparatively long lever pivoted to said slide and carrying at its forward end a head, said head being arranged to engage on the forward stroke alternately with the studs or shoulders of one pair, whereby successive movements of the movable part in the same direction will effect opposite movements in the switch-point, said head being provided on its rear side with inclined or rounded faces which on the back stroke engage alternately with the studs of the other pair, whereby said head is swung beyond its longitudinal center.

7. In a railway-switch-operating device, the combination with a switch-point, of a rocking lever connected thereto and provided with two pair of studs or shoulders, one of each pair being on opposite sides of the longitudinal axis of the lever, a horizontally-movable part adapted to be moved longitudinally from the car, means for returning it to its normal position after having been moved longitudinally, and an oscillating head connected to said movable part and arranged to swing beyond its center in both directions, said head being arranged to engage on its forward stroke alternately with the said studs or shoulders of one pair, whereby successive movements of the movable part in the same direction will effect opposite movements in the switch-point, said head being provided on its rear side with inclined or rounded faces near its ends and inside the same with inclined or concave faces sloping toward the center of said head, which inclined or rounded faces on the back stroke are adapted to engage one of the other pair of studs or shoulders on the rocking lever, whereby said head is swung beyond its longitudinal axis and the inclined or concave face on its opposite side is brought into engagement with the other one of said pair of studs to move the oscillating lever to the limit of its stroke.

8. In a railway-switch-operating device, the combination with a switch-point, of a rocking lever, adjustable connections between said switch-point and lever, a horizontally-movable part lying in the path of a wheel or wheels of the car and adapted to be moved longitudinally thereby, when the rotation of the wheel is retarded, means for returning said movable part to its normal position, and means connected to the movable part and adapted to engage the rocking lever, whereby successive movements of the movable part in the same direction will effect opposite movements in the switch-point, said means being constructed and arranged to engage the rocking lever and complete its throw on the backward stroke of the movable part.

9. In a railway-switch-operating device, the combination with a switch-point, a rocking lever, an eccentric sleeve connected to said lever, a link pivoted on said eccentric sleeve and connected to the switch-point, said rocking lever being provided with a pair of shoulders or studs on opposite sides of its longitudinal axis, a horizontally-movable slide adapted to be actuated from the car, means for returning the same to its normal position after having been moved longitudinally, an oscillating head connected to said slide and having means on opposite sides of its longitudinal axis for engaging the shoulders or studs on the rocking lever both on its forward and backward strokes, whereby successive movements of the slide in the same direction will effect opposite movements in the switch-point.

10. In a railway-switch-operating device, the combination with a switch-point, of a rocking lever connected thereto and provided with shoulders or studs on opposite sides of its longitudinal axis, a horizontally-movable slide, an oscillating head connected to the same and having means on opposite sides of its longitudinal axis for engaging the shoulders or studs on the rocking lever, whereby successive movements of the slide in the same direction will effect opposite movements of the switch-point, a horizontally-movable part lying in the path of the wheel or wheels of the car and adapted to be moved longitudinally thereby, means for returning said movable part to its normal position after having been moved longitudinally, and adjustable connections between said movable part and the reciprocating slide.

11. In a railway-switch-operating device, the combination with a switch-point, of a horizontally-movable carriage, a projection on said carriage provided with an inclined upper surface lying in the path of a wheel or wheels of the car and adapted to be moved longitudinally thereby when the rotation of the wheel is retarded, means for returning said carriage to its normal position after having been moved longitudinally by the car-wheel, and normally disconnected means between the movable part and switch-point, whereby successive movements of the movable part in the same direction will effect opposite movements of the switch-point.

12. In a railway-switch-operating device, the combination with a switch-point, of a horizontally-movable part adjacent to one of the rails of the track and in the path of the wheel or wheels on that side of the car and adapted to be moved longitudinally thereby when the rotation of the wheel is retarded, connections between the said movable part and the switch-point for moving the latter, and an independent movable part located adjacent the opposite rail of the track and lying in the path of the wheel on that side of the car and adapted to support and carry forward the said wheel when the opposite wheel is on the first-named movable part.

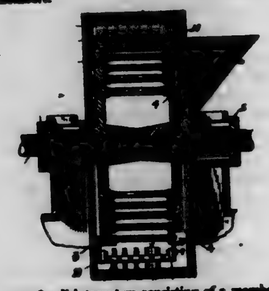
13. In a railway-switch-operating device, the combination with a switch-point, of a horizontally-movable part lying adjacent to one of the rails of the track and in the path of a wheel on one side of the car and adapted to be moved longitudinally thereby when the rotation of the wheel is retarded, means for returning said movable part to its normal position after having been moved longitudinally by the car-wheel, normally disconnected means between the movable part and the switch-point, whereby successive movements of the movable part in the same direction will effect opposite movements in the switch-point, an independent longitudinally-movable part adjacent the opposite rail and lying in the path of the wheel on the opposite side of the car and adapted to move longitudinally with the said wheel when locked, and means for returning said second movable part to its normal position after having been moved longitudinally by the car-wheel.

14. In a railway-switch-operating device, the combination with a switch-point, of a horizontally-movable carriage adjacent to one of the rails of the track and provided with a projection having an inclined upper face lying in the path of a wheel or wheels of the car and adapted to be moved longitudinally thereby when the rotation of the wheel is retarded, means for returning said movable part to its normal position after having been moved longitudinally by the car-wheel, normally disconnected means between the movable part and the switch-point, whereby successive movements of the movable part in the same direction will effect opposite movements in the switch-point, a longitudinally-movable carriage adjacent the opposite rail of the track and provided with a projection having an inclined upper face lying in the path of the wheel on the opposite side of the car and adapted to be moved longitudinally thereby when the wheel is locked, and means for returning said second carriage to its normal position after having been moved longitudinally by the car-wheel.

708,972. ATTACHMENT FOR DISINTEGRATORS. CHARLES J. SAMUELSON and BORGE M. JOHNSON, Caldera Station, Utah. Filed Mar. 15, 1902. Serial No. 98,431. (No model.)

Claim.—1. A scraper of the class described consisting of two members one of which is secured to the periphery of the rotary cage, and the

other secured to said first-mentioned member, and scraper-teeth clamped between the members.



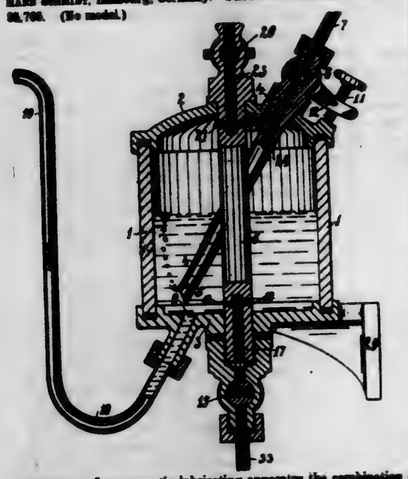
2. A scraper for disintegrators consisting of a member 6 secured to the periphery of the outer cage and having a recess, a clamping member fitted in said recess, and adjustable scraper-teeth carried by said members.

3. In a disintegrator, the combination with the cages and a casing inclosing the same, of a scraper projecting beyond the periphery of the outer cage, and composed of a member having a cross-bar provided with grooves, and a clamping member provided with grooves to alline with grooves in the cross-bar, and scraper-teeth adjustably mounted in said grooves.

4. In a disintegrator, the combination with the cages and a casing inclosing the same, of a scraper consisting of a member 6 having a cross-bar and projecting ears at the end of said bar to form a recess therebetween, a clamping member secured in said recess, and adjustable scraper-teeth clamped between the members.

5. In a disintegrator, the combination with the cages and the casing inclosing the same, of scrapers mounted on the periphery of the outer cage and each consisting of a fixed member and a removable clamping member, removable and adjustable scraper-teeth carried by the members and arranged in alternate relation to each other so that the teeth of each scraper will travel in a different path to scrape the entire inner surface of the casing.

708,973. PNEUMATICALLY-OPERATED LUBRICATOR. HERMANN SCHELDT, Hamburg, Germany. Filed Dec. 13, 1901. Serial No. 86,703. (No model.)



Claim.—1. In pneumatic lubricating apparatus the combination of a transparent oil-reservoir, a supply-pipe for compressed air leading to the lower part of the said reservoir, an oil-pipe leading from the lower part of said reservoir to the part to be lubricated, an oil-supply reservoir above the level of the part to be lubricated and a pipe leading from the said supply-reservoir to the transparent reservoir substantially as described.

2. In pneumatic lubricating apparatus the combination of a transparent oil-reservoir, a supply-pipe for compressed air leading to the lower part of the said reservoir, a cock for regulating said air-supply, an oil-pipe leading from the lower part of said reservoir to the part to be lubricated, an oil-supply reservoir above the level of the part to be lubricated and a pipe leading from the said supply-reservoir to the transparent reservoir, substantially as described.

3. In pneumatic lubricating apparatus the combination of a transparent oil-reservoir, a supply-pipe for compressed air leading to the lower part of the said reservoir, a cock for regulating said air-supply, and oil-pipe leading from the lower part of said reservoir to the part to be lubricated, an oil-supply reservoir above the level of the part to be lubricated, a pipe leading from the said supply-reservoir to the transparent reservoir and a cock adapted to control the communication of the upper part of the transparent reservoir with the exterior atmosphere, substantially as described.

708,974. CARPET-STRETCHER. MARTIN R. SHIRK, Chicago, Ill., assignor to Frederick J. Herbert, Chicago, Ill. Filed Apr. 15, 1901. Serial No. 55,942. (No model.)

Claim.—1. In a carpet-stretcher, the combination of a shank having on its upper face a series of rack-teeth and having at one end a downwardly-projecting claw, a sleeve having an opening extending entirely through the same to receive said shank and permit its projection through the sleeve at either end, and being longitudinally slidable along said shank, a plate pivoted on said sleeve at an angle to said shank and having thereon a spiral thread in mesh with the teeth on said shank, a handle for revolving said plate, and a bar pivoted to the under part of said sleeve below and near said plate and having thereon a number of downwardly-projecting claws coacting with the claw on said shank.

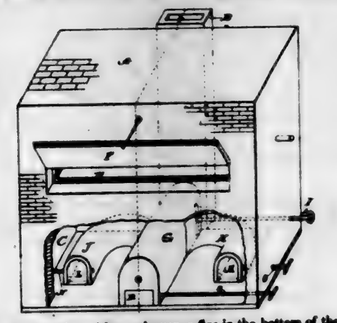
2. In a carpet-stretcher, the combination of a shank having on its upper face a series of rack-teeth and having at one end and integral therewith a downwardly-projecting claw, a sleeve having an opening extending entirely through the same to receive said shank and permit its projection through the sleeve at either end, and being longitudinally slidable along said shank, a plate pivoted on said sleeve at an angle to said shank and having thereon a spiral thread in mesh with the teeth on said shank, a handle for revolving said plate, and a bar secured to the under part of said sleeve below and near said plate and having thereon a number of downwardly-projecting claws coacting with the claw on said shank.

3. A carpet-stretcher comprising a flattened shank 1 having one end bent downwardly and sharpened to form the integral claw 3 and having a series of rack-teeth on the upper edge of said shank; the sleeve 2 through which said shank projects at both ends, having an opening through its upper part to expose the rack-teeth therein; the toothed bar 4 pivoted to the under side of the sleeve 2; and the plate 7 having a spiral thread on its under face, having a handle and being pivoted to said sleeve on an incline with part of said spiral thread in mesh with the teeth exposed through said opening.

4. In a carpet-stretcher, the combination of a shank having on its upper face a series of rack-teeth and having at one end a downwardly-projecting claw, a sleeve longitudinally slidable along said shank, a plate pivoted on said sleeve at an angle to said shank and having thereon a spiral thread in mesh with the teeth on said shank, a handle for revolving said plate, and a bar pivoted to the under part of said sleeve below and near said plate and having thereon a number of downwardly-projecting claws coacting with the claw on said shank, said bar being adapted to be turned at any angle to said shank or substantially parallel with same.

708,975. BAKER'S OVEN. CHARLES E. GLAPKE, Los Angeles, Cal. Filed Aug. 2, 1901. Serial No. 70,645. (No model.)

Claim.—1. In a reel-oven, a flue in the lower portion of the baking-chamber, extending therethrough to and communicating with the chimney; a damper in the opening between the flue and chimney; a branch flue in communication with the main flue near the chimney, and extending away from and terminating near the front wall of the oven, in an open end; a damper in the open end of the branch flue and a door in the front wall of the oven above the said flues, whereby the products of combustion pass through the main flue, then into the auxiliary flue and out thereof up through the oven and out of the door thereof.

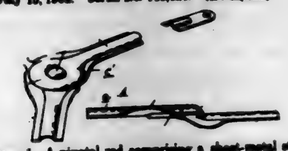


2. In combination with a reel-oven, a flue in the bottom of the oven extending therethrough transversely to the axis of the reel and communicating with the chimney; a damper in the opening between the flue and chimney; a branch flue communicating with the main flue near the chimney, on each side thereof, extending away therefrom, and toward, and terminating in an open end near the front wall of the oven; a damper in the open ends of the branch flues, and a hydrocarbon-burner in the front end of the main flue and a door in the front wall of the oven above the said flues, whereby the products of combustion pass through the main flue, then into the auxiliary flue and out thereof up through the oven and out of the door thereof.

3. In a reel-oven, a main flue in the bottom of the baking-chamber, extending therethrough, in communication with the chimney and having the front portion adapted for a combustion-chamber; a damper adapted to control the communication between the flue and chimney; branch flues in communication with the main flue, near the chimney and extending away from, and toward, and terminating in open ends near the front wall of the oven; dampers in, and adapted to control the open ends of the branch flues and a door in the front wall of the oven above the said flues, whereby the products of combustion pass through the main flue, then into the auxiliary flue and out thereof up through the oven and out of the door thereof.

4. In a reel-oven, a main flue in communication with the chimney, having its front end adapted for a combustion-chamber; a branch flue in communication with the main flue near the chimney, extending away from said flue, and terminating in an open end near the front of the oven; a damper in the main flue, controlling the opening therefrom into the chimney; a damper in the branch flue controlling its open end, and a door in the front wall of the oven above the said flues, whereby the products of combustion pass through the main flue, then into the auxiliary flue and out thereof up through the oven and out of the door thereof in combination with a hydrocarbon-burner in the combustion-chamber of the main flue.

708,976. FOLDING ROD. JEREMIAH P. JOHNSON, Detroit, Mich. Filed July 15, 1902. Serial No. 115,630. (No model.)



Claim.—1. A pivotal rod comprising a sheet-metal stamping fashioned to form at its end an annular rib surrounding a central pivot-aperture with an intermediate flange forming a seat for the head of the pivot, and a ribbed shank merging into said annular rib.

2. A pivotal rod comprising a sheet-metal stamping fashioned to form an annular rib of channeled cross-section having an inwardly-extending concentric annular flange surrounding a pivot-aperture and forming a seat for the head of the pivot, and a ribbed shank merging into said annular rib.

3. A pivotal rod comprising a sheet-metal stamping fashioned to form an annular rib surrounding a central aperture, a shank merging into said annular rib and a web or flange forming a strengthening-brace at the juncture of said shank and annular rib.

4. A pivotal rod comprising a sheet-metal stamping fashioned to form an annular rib surrounding a central aperture, a ribbed shank merged into said annular rib, and a turned web or flange forming a strengthening-brace at the juncture of said shank and annular rib.

5. A pivotal rod comprising a sheet-metal stamping fashioned to form an annular channeled rib surrounding a central aperture, a channeled shank merging into said annular rib, and a web or flange extending laterally from the base of said shank also merging into the base of said annular rib and having the portion at the angle between said shank and annular rib turned to form a strengthening-brace.

6. A folding rod comprising a pair of sheet-metal stampings fashioned to form complementary male and female annular ribbed bearings, a pivot arranged centrally of said annular bearings and securing the same together, and a ribbed shank formed integral with and merging into each of said annular bearings.

7. A folding rod comprising a pair of sheet-metal stampings fashioned to form complementary male and female annular channeled ribs each having an inwardly-extending annular flange surrounding a central aperture, a pivot passing through said aperture and headed to bear on opposite sides of said flanges to secure said stampings together, and ribbed shanks merging into each of said annular bearings and arranged on opposite sides of a central plane so as to permit of folding into parallelism.

8. A folding rod comprising a pair of sheet-metal stampings fashioned to form complementary male and female annular channeled ribs, a centrally-arranged headed pivot securing said stampings together, a ribbed shank formed integral with said flanges at the juncture of said shanks and annular bearings respectively turned in opposite directions in the two members to permit said shanks to be folded into parallelism.

9. A folding rod comprising a pair of stampings each fashioned to form complementary male and female pivotal bearings and outwardly-extending ribbed shanks and inclined oppositely-extending side flanges on each member forming engaging stops for arresting further movement when said members are turned into alinement.

10. A folding rod comprising a pair of stampings pivotally engaging each other, a pivotal bearing at one end of said rod formed by a struck-out annular flange and a washer shoved upon said flange.

708,977. COMBINED ORE-ROASTING AND FUME-SAVING APPARATUS. WILLIAM H. HOOVER, Denver, Colo. Filed Nov. 26, 1901. Serial No. 83,054. (No model.)

Claim.—1. In a roasting-furnace, the combination with a source of heat and a chamber in communication therewith, of a rotary conveyor located in the chamber, a hollow feed-screw connected with the conveyor at one extremity, a perforated pipe concentrically arranged in said conveyor and passing through the feed-screw, and means connected with said pipe outside of the furnace, for drawing off the fumes rising from the ore during the roasting operation, substantially as described.

2. The combination with a source of heat and a chamber in communication therewith, of a rotary conveyor located in the chamber and having closed walls to protect the ore from coming in direct contact with the products of combustion, a hollow feed-screw connected with the con-

veyer at one extremity, a perforated pipe concentrically arranged in said conveyer and passing through the feed-screw, and means connected with said pipe outside of the furnace for drawing off the fumes rising from the ore during the roasting operation.

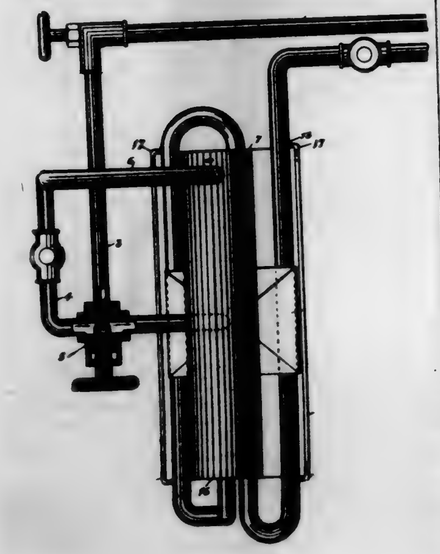
2. In a roasting-furnace, the combination with a combustion-chamber, of a rotary conveyer extending longitudinally thereof and provided on its inner surface with a broken spiral or a screw-thread for agitating the ore and causing it to travel through the conveyer whose walls are closed to prevent the ore from coming in direct contact with the products of combustion, a hollow feed-screw connected with the conveyer at one extremity, a perforated pipe concentrically arranged in said conveyer and passing through the feed-screw, and means connected with said pipe outside of the furnace for drawing off the fumes rising from the ore during the roasting operation.

4. In a roasting-furnace, the combination with a combustion-chamber, of a rotary conveyer extending longitudinally therethrough, a hollow feed-screw connected with the conveyer at one extremity, and a perforated pipe concentrically arranged in the conveyer and passing through the feed-screw for discharging the fumes from the conveyer, substantially as described.

5. The combination with a combustion-chamber, of a rotary conveyer located therein, a hollow feed-screw connected with the conveyer at one extremity, a perforated pipe concentrically arranged in the conveyer and passing through the feed-screw, the said pipe being connected to rotate with the conveyer, a stationary conduit connected with the said pipe, suction means connected with the conduit for drawing off the fumes rising from the ore during the roasting operation, a liquid-containing tank, and a conduit connected with said suction means for forcing the fumes into the liquid of the tank, substantially as described and for the purpose set forth.

6. The combination with a combustion-chamber, of a rotary conveyer mounted in operative relation therein, and having its walls closed to protect the ore from direct contact with the products of combustion, a pipe concentrically arranged in said conveyer and having openings in its walls to allow the fumes rising from the ore to enter, means for connecting the pipe and the conveyer to cause them to rotate in unison, a hollow screw for feeding the ore to the conveyer, the perforated pipe passing through said screw, a stationary conduit connected with the perforated pipe outside of the conveyer, the connection being such as to allow one pipe to turn upon the other, a liquid-containing receptacle, and means connected with said conduit for drawing off the fumes rising from the ore during the roasting operation, and forcing them into the liquid of the receptacle for the purpose set forth.

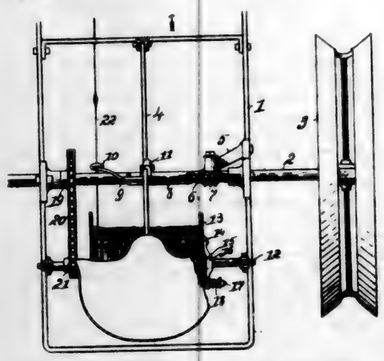
708,978. BURNER FOR OIL. OLIVER TILLMAN, San Jose, Cal., assignor to Charles Eduard, San Jose, Cal. Filed Nov. 18, 1901. Serial No. 82,602. (No model.)



Claim.—1. The combination of the steam-drum, the water-pipe leading thereto, the pan in which said water-pipe is coiled, the spreader above said pan and below said drum, the steam-pipe issuing from said drum, the oil-supply pipe leading into said steam-pipe, the branch steam-pipes into which the oil and steam flow, and the nozzles terminating said branch pipes and discharging against said spreader, substantially as described.

2. The combination of the steam-drum, the water-pipe leading thereto, the pan in which said water-pipe is coiled, the spreader above said pan and below said drum, the steam-pipe issuing from said drum, the oil-supply pipe leading into said steam-pipe, the branch steam-pipes into which the oil and steam flow, the nozzles terminating said branch pipes and discharging against said spreader, and the wire-gauze in said nozzles, substantially as described.

708,979. CORN-PLANTER. EDWARD M. HEYLMAN, Janesville, Wis., assignor to Janesville Machine Company, Janesville, Wis., a Corporation of Wisconsin. Filed June 5, 1902. Serial No. 110,382. (No model.)



Claim.—1. The combination with the axle-shaft of a planter and a reel journaled crosswise of the planter-frame, of a worm on the axle-shaft, a worm-wheel in mesh with the worm, a wire-guide and a pitman connecting the wire-guide with the worm-wheel.

2. The combination with the axle-shaft of a planter and a reel journaled crosswise of the planter-frame, of a worm on the axle-shaft, a worm-wheel in mesh with the worm, an oscillating arm carrying a wire-guide in its swinging end and a pitman connecting the worm-wheel with the arm.

3. The combination with the axle-shaft of a planter and a reel journaled crosswise of the planter-frame, of a seat-bar above the axle-shaft, an arm pivotally connected with the seat-bar, a wire-guide in the swinging end of the arm, a worm on the axle-shaft, a worm-wheel in mesh with the worm-end a pitman connecting the worm-wheel with the arm.

4. In a reel for check-row wire, the combination of a reel-shaft, a reel journaled loosely on the shaft, a friction-bearing on the reel-shaft adjacent to an end of the reel, a hooked lug on the end of the reel in proximity to the friction-bearing on the shaft, a friction-arm having one end in pivotal engagement with the hooked lug and also having its intermediate part in contact with the friction-bearing of the shaft, and a spring forcing the opposite end of the arm toward the reel.

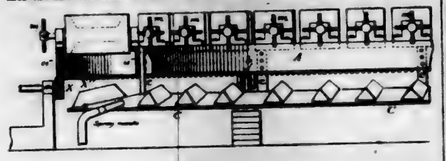
REISSUES.

12,028. CASTING APPARATUS. DAVID T. CROXTON, Canal Dover, and SAMUEL W. CROXTON, Cleveland, Ohio. Filed May 5, 1902. Serial No. 106,086. Original No. 656,372, dated May 29, 1900.

Claim.—1. The combination of the rotary wheel A, the molds M, M, rotatably mounted thereupon, the ingot receiving and conveying platform C suspended from said wheel A, and underneath the molds, and the post P having arm q projecting over the platform, and in the path of the ingots, substantially as described and for the purpose set forth.

2. In casting apparatus, in combination, a horizontally-arranged rotary mold-carrier, molds thereon for receiving the molten metal to form castings, and a castings-carrier below the mold-carrier arranged to rotate around the axis of the mold-carrier and to support the castings while they are stationary vertically after they have been removed from the molds and while they are rotating around said axis, substantially as set forth.

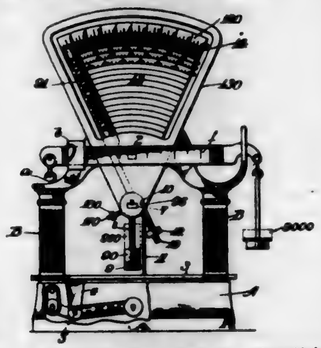
3. In casting apparatus, in combination, a rotary mold-carrier arranged to rotate on a horizontal axis, the molds mounted on axes on the said carrier and adapted to deliver the castings downward, and a rotary receiver and carrier for the castings below the molds and arranged to rotate around the axis of the mold-carrier, substantially as set forth.



4. In casting apparatus, in combination, the horizontally-arranged rotary mold-carrier, the molds mounted on axes on the said carrier and arranged to deliver downward the castings, the receiver and carrier for the castings below the molds rotating around the axis of the mold-carrier, and means for causing the escape of the castings from the said castings-carrier, substantially as set forth.

5. In casting apparatus, in combination, a horizontally-arranged mold-carrier rotatable around a vertical axis, a series of molds mounted on axes thereon and arranged to deliver downward the castings, the receiver and carrier for the castings below the mold-carrier and adapted to rotate around the vertical axis of the mold-carrier, and power devices adapted to rotate simultaneously both the mold-carrier and the castings-carrier, substantially as set forth.

12,029. SCALE. ALLEN DE VILBISS, Jr., Toledo, Ohio, assignor, by mesne assignments, to Toledo Scale and Cash Register Company, Newark, N. J., a Corporation of New Jersey. Filed Dec. 19, 1901. Serial No. 86,607. Original No. 665,147, dated July 31, 1900.



Claim.—1. In a computing-scale, a price-computing table having a plurality of rows of price-totals, in combination with an index having a plurality of rows of price units of which the corresponding-arranged numbers in the two rows coöperate with the same price-totals upon the computing-table and indicate values at different prices per pound; substantially as described.

2. In a computing-scale, a price-computing table having a plurality of rows of price-totals, in combination with an index having a plurality of rows of price units arranged side by side and coöperating with the same rows of price-totals upon the computing-table; substantially as and for the purpose described.

3. In a computing-scale, a weighing and price-computing table having a plurality of rows of weight units of which the numbers in one row are multiples of those in the other, and a plurality of rows of price-totals, in combination with an index having a plurality of rows of price units of which the numbers in one row are multiples of those in the other, said rows of price units coöperating with the rows of price-totals upon the computing-table in the manner and for the purpose described.

4. In a computing-scale, a weighing and price-computing table having a plurality of rows of weight units of contrasting colors and of which the numbers in one row are multiples of those in the other, and a plurality of rows of price totals, in combination with an index having a plurality of rows of price units of contrasting color and of which the numbers in one row are multiples of those in the other, said rows of price units cooperating with the rows of price-totals upon the computing-table in the manner and for the purpose described.

5. In a computing-scale, a weighing and price-computing table having a plurality of rows of weight units, and a plurality of rows of price-totals, in combination with an index having a plurality of rows of price units arranged side by side and of which the numbers in one row and the correspondingly-arranged numbers in the other row coöperate with the same rows of price-totals upon the computing-table in the manner and for the purpose described.

6. In a computing-scale, a weighing and price-computing table having a plurality of rows of weight units of contrasting colors, and a plurality of rows of price units, in combination with an index having a plurality of rows of price units of contrasting color and of which the numbers in one row and the correspondingly-arranged numbers in the other row cooperate with the same rows of price-totals upon the computing-table in the manner and for the purpose described.

7. In a computing-scale, a price-computing table having a plurality of rows of price-totals, in combination with an index having a plurality of rows of price units of which the numbers in one row are multiples of those in the other, said computing-table and index being movable relatively to each other under the influence of the load upon the scale-platform, means for counterbalancing the weight of the load upon the scale-platform and resisting said relative movement of the computing-table and index, and means for multiplying said resistance at will for the purpose described.

8. In a computing-scale, a weighing and price-computing table having a plurality of rows of weight units, and a plurality of rows of price-totals, in combination with an index having a plurality of rows of price units arranged side by side and having the correspondingly-arranged numbers in the several rows coöperating with the same rows of price-totals, said computing-table and index being movable relatively to each other under the influence of the load upon the scale-platform, means for counterbalancing the weight of the load upon the scale-platform and resisting said relative movement of the computing-table and index, and means for multiplying said resistance at will for the purpose described.

9. In a computing-scale, a weighing and price-computing table having a plurality of rows of weight units of contrasting color, and a plurality of rows of price-totals, in combination with an index having a plurality of rows of price units of contrasting color arranged side by side and having the correspondingly-arranged numbers in the several rows cooperating with the same rows of price-totals, said computing-table and index being movable relatively to each other under the influence of the load upon the scale-platform, means for counterbalancing the weight of the load upon the scale-platform and resisting said relative movement of the computing-table and index, and means for multiplying said resistance at will for the purpose described.

10. In a computing-scale, a price-computing table having a plurality of rows of price-totals, in combination with an index having two rows of price units of which the numbers in one row are double those in the other, a weighted pendulum coöperating with the index and computing-table and opposing movement of them relatively to each other, and a supplemental weight applicable to said pendulum to double the resistance offered by it to such relative movement of the index and computing-table; substantially as and for the purpose described.

11. In a price-computing scale, a weighing and price-computing table having two rows of weight units of which the numbers in one row are double those in the other, and a plurality of rows of price-totals, in combination with an index having two rows of price units corresponding to the respective rows of weight units, and of which the numbers in one row are double those in the other, a weighted pendulum coöperating with the index and computing-table and opposing movement of them relatively to each other, and a supplemental weight applicable to said pendulum to double the resistance offered by it to such relative movement of the index and computing-table; substantially as and for the purpose described.

12. In a computing-scale, a weighing and price-computing table having two rows of weight units of contrasting color and of which the numbers in one row are double those in the other, and a plurality of rows of price-totals, in combination with an index having two rows of price units of contrasting color corresponding to the respective rows of weight units and of which the numbers in one row are double those in the other, a weighted pendulum coöperating with the index and computing-table and opposing movement of them relatively to each other, and a supplemental weight applicable to said pendulum to double the resistance offered by it to such relative movement of said index and table; substantially as and for the purpose described.

13. In a computing-scale, a weighing and price-computing table provided with a plurality of concentrically-curved rows of weight units having their graduations and numbers in radial line with each other, and a plurality of curved rows of price-totals concentric to the rows of weight units, in combination with a radial index-hand movable over said table under the influence of the load upon the scale-platform and provided with

a plurality of rows of price units arranged side by side and having the correspondingly-arranged numbers in the several rows corresponding with the same rows of price-totals, means for counterbalancing the weight of the load upon the scale-platform and against the resistance of which the index-hand is moved over the computing-table by the weight of such load, and means for multiplying at will the resistance offered to such movement of the index-hand under the weight of said load; substantially as described.

14. In a computing-scale, the computing-table 13 having two rows of weight units 140 and 14, and the plurality of rows of price-totals, in combination with the index-hand 91 having the two rows of price units, the pendulum 8 connected at its upper end to the index-hand 91, the weight 9 normally carried by said pendulum, and the supplemental weight 90 applicable thereto; substantially as and for the purpose described.

15. A computing attachment for scales, comprising a price-computing table, an index movable relatively thereto and provided with a series of price units, in combination with a scale-platform, the usual lever mechanism within the scale-base supporting said platform, the main scale-beam connected with said lever mechanism and provided with a poise movable lengthwise thereof, and a supplemental lever and connections intermediate the lever mechanism within the scale-base and the price-computing attachment for causing the weight of the load placed upon the scale-platform to move the index relatively to the computing-table; substantially as described.

16. A computing attachment for scales, comprising a price-computing-table, an index-hand movable thereover and provided with a series of price units, and means for counterbalancing the weight of the load placed upon the scale-platform, against the resistance of which means the index-hand is moved over the computing-table by the weight of such load, in combination with the scale-platform, the usual lever mechanism within the scale-base supporting said platform, the main scale-beam connected with said mechanism and provided with a poise movable lengthwise of the beam, and a supplemental lever and connections intermediate said lever mechanism and the index-hand for causing the weight of the load placed upon the scale-platform to swing the index-hand over the computing-table; substantially as described.

17. In a computing attachment for scales, the housing 130, the computing-table 13, the disk 96 mounted in the lower end of said housing, the index-hand 91 projecting from said disk and cooperating with the table 13, and the weighted pendulum 8 depending from the disk 96, in combination with the scale-base A, the lever mechanism within said base supporting the weighing-platform 3 and comprising the main lever 165, the main scale-beam 1 fulcrumed on the housing 130 and connected at one end to the lever 165 by the link a, the supplemental lever 16 fulcrumed in the scale-base and connected to the lever 165, and the link 11 connecting the lever 16 with the disk 96; substantially as described.

18. A computing attachment for scales consisting of a table, a disk pivotally connected thereto and having a pendulum hanging normally vertical and a hand standing normally at zero on the table, both right with the disk, a screw projecting from the disk diametrically opposite the hand, and a counterpoise-nut thereon; combined with an arm pivoted within the base, a link connecting one end with a pivot on said disk, a connecting-link connecting said arm with the scale mechanism within the base, and means for counterbalancing the weight of the arm and link; substantially as described.

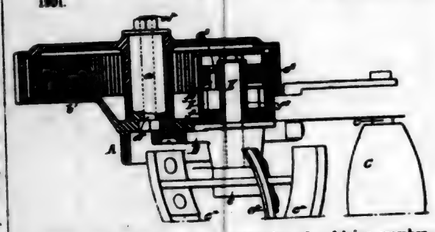
19. A computing attachment for scales consisting of a table, a pendulum and hand standing at angles to each other and pivotally connected to said table at their point of juncture, and means for counterbalancing the weight of the hand when the pendulum stands vertical; combined with an arm pivoted within the base and arched over and connected with the main lever of the mechanism therein, a link connecting the outer end of the arm with said pendulum at a point normally above the pivot of the latter, and means for counterbalancing the weight of the arm and link, substantially as described.

20. A computing attachment for scales consisting of a table, a pendulum and index at an angle to each other and pivotally connected to said table at their point of juncture; combined with an arm within the base connected respectively with the mechanism therein and with the pendulum, a frame at the inner end of the arm, slitted pivots projecting laterally therefrom, a yoke carried by the base and having bearings for said pivots, and an adjustable counterpoise for the arm located within the frame, as and for the purpose set forth.

21. A computing attachment for scales consisting of a table, and a pendulum and index standing at an angle to each other and pivotally connected to said table at their point of juncture; combined with an arm within the base connected respectively with the mechanism therein and with the pendulum, a frame at the inner end of the arm, pivots for supporting this frame, a screw projecting from its outer side toward and in alinement with the body of the arm, and a counterpoise threaded upon said screw, as and for the purpose set forth.

22. A computing attachment for scales consisting of a table, a pendulum, a hand moved by the pendulum over the table, and an arm within the base connected at its outer end with said pendulum; combined with a frame carried rigidly by the inner end of the arm, outwardly-projecting slitted knife-edge pivots on the frame, a yoke within the base having bearings for said pivots, a screw within the frame in alinement with the body of the arm, and a counterpoise-weight adjustable thereon, all as and for the purpose set forth.

12,080. CLUTCH. PAUL A. HOUSTALLEN, Riverton, N. J. Filed Feb. 28, 1902. Serial No. 96,191. Original No. 693,844, dated Dec. 10, 1901.



Claim.—1. In a clutch, the combination of a driving member, a driven shaft having a wheel fixed thereto, slots in the driving member eccentric to the axis of revolution thereof and arms having projections entering said slots and constructed to engage said wheel when the said projections are in the part of the slots farthest away from the axis of revolution of the driving-wheel, the projections serving to transmit power from the driving member to the wheel on the driven shaft, substantially as described.

2. In a clutch, the combination of a driving-wheel, a driven shaft having a ratchet-wheel fixed thereto, slots in the driving-wheel eccentric to the axis of revolution thereof and pawls having projections entering said slots and constructed to engage the teeth on said ratchet-wheel when the said projections are in the part of the slots farthest away from the axis of revolution of the driving-wheel, said projections performing the double function of operating the pawls and transmitting power from the driving-wheel to the ratchet-wheel through said pawls, substantially as described.

3. In a clutch, the combination of a driving-wheel, a driven shaft carrying a ratchet-wheel keyed to it, a carrier loosely mounted on the said shaft, pawls pivoted thereto with mechanism operated by the driving-wheel for throwing the pawls into engagement with the teeth of the ratchet-wheel when said driving-wheel turns at a higher rate of speed than the shaft, said mechanism performing the double function of operating the pawls and transmitting power from the driving-wheel to the ratchet-wheel through said pawls, substantially as described.

4. The combination of a driving-wheel, a driven shaft, an internally-toothed ratchet-wheel keyed thereto, a carrier loosely mounted on the shaft within the said ratchet-wheel, pawls pivoted thereto and constructed to be thrown into engagement with the teeth of said ratchet-wheel when they are turned on their pivots, with mechanism operated by the said driving-wheel serving the double purpose of throwing the said pawls into and out of engagement with the ratchet-wheel when the relative speed of the two wheels is varied, and transmitting power from the driving-wheel to the pawls and to the ratchet-wheel, substantially as described.

5. The combination in a clutch, of a driving-wheel having in its web slots eccentric to its axis of revolution, a driven shaft having a ratchet-wheel keyed thereto, a carrier on said shaft independent of the driving-wheel, pawls pivoted thereto, said pawls having projections entering the slots of the driving-wheel, through which power is transmitted from said driving-wheel, and being constructed to engage with the teeth on the said ratchet-wheel when they are swung on their pivots away from their axis of revolution, substantially as described.

6. The combination in a clutch, of a driving-wheel having slots in its web eccentric to its axis of revolution, a driven shaft having a carrier mounted upon it independently of the driving-wheel, pawls pivoted to the carrier, an internally-toothed ratchet-wheel in the same plane as the said carrier and studs projecting from the pawls and extending into the slots in the driving-wheel, said pawls being constructed to engage the teeth of the ratchet-wheel when the driving-wheel moves at a higher rate of speed than the said ratchet-wheel, substantially as described.

7. The combination in a clutch, of a driving-wheel having in its web slots eccentric to its axis of revolution, a driven shaft having keyed to it a ratchet-wheel, a carrier on the shaft having arms projecting from it, hooked pawls pivoted to the same, said hooked pawls carrying rollers which enter the slots in the driving-wheel, said pawls being constructed to be thrown into engagement with the teeth of the ratchet-wheel when the driving-wheel is moved at a higher rate of speed than the driven shaft, substantially as described.

8. In an operating mechanism for a lawn-mower, the combination of an internally-toothed traction-wheel, a pinion having eccentric slots in its web within the traction-wheel, a knife-shaft, a ratchet-wheel keyed on the same, a carrier loosely mounted on the shaft carrying pawls constructed to engage the teeth of the ratchet-wheel, studs on the pawls entering the slots in the said pinion, whereby the said pawls are thrown into engagement with the ratchet-wheel when the pinion is revolved at a higher rate of speed than said wheel, substantially as described.

9. In a clutch, the combination of two members, one member having a cam-surface, one or more arms constructed to engage one of said members, one or more pins operated by the cam-surface and serving the double function of directly operating the arms and directly transmitting power from one of said members through a comparatively short portion only of said arms to the other member, substantially as described.

10. In a clutch, the combination of two members, a ratchet-wheel connected to one of the same, a carrier, one or more pawls pivoted to the carrier each provided with a device operated by one of said members for throwing said pawls into engagement with the teeth of the ratchet-wheel when the relative speed of the members is varied, said device being arranged to directly operate its pawl and transmit power from one member to the other through a comparatively short portion only of the pawl, substantially as described.

11. In a clutch, the combination of a shaft, a ratchet-wheel, pawls, a pawl-carrier, pins to directly operate the one or more pawls and to directly transmit the motion to the part to be driven through a comparatively short portion only of the pawl, and means for causing the pins to cause the pawls to engage and disengage the ratchet-wheel, substantially as described.

12. In a clutch the combination of a shaft, a ratchet-wheel, one or more pawls, a pawl-carrier loose on the shaft, one or more pins to operate the pawls and arranged to directly transmit the motion to the part to be driven through a comparatively short portion only of the pawl, and means for causing the pins to cause the pawls to engage and disengage the ratchet-wheel, substantially as described.

13. In a clutch, the combination with a driving part and a part to be driven, of a ratchet-wheel, one or more pawls adapted to be engaged therewith and disengaged therefrom, one or more pins for directly operating said pawls and arranged to directly transmit the power from the driving to the driven part through a comparatively short portion only of the pawl, and cams for actuating said pins and effecting said engagement of the pawls with and their disengagement from the said ratchet-wheel, substantially as described.

DESIGNS.

36,042. BADGE. JOSEPH T. BAILEY, Philadelphia, Pa. Filed Aug. 16, 1902. Serial No. 119,971. Term of patent 14 years.

Claim.—The ornamental design for a badge substantially as shown and described.

36,043. HANDLE FOR BUTTON-HOOKS OR SIMILAR ARTICLES. HENRY A. KELLER, New York, N. Y. Filed Aug. 12, 1902. Serial No. 119,692. Term of patent 7 years.

Claim.—The ornamental design for a handle for button-hooks, or similar articles, substantially as shown and described.

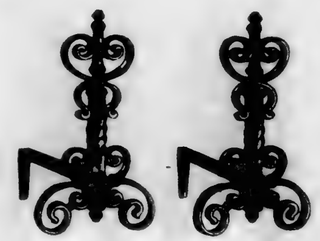
36,044. SHIELD. HENRY A. KELLER, New York, N. Y. Filed Aug. 12, 1902. Serial No. 119,689. Term of patent 7 years.

Claim.—The ornamental design for a shield, substantially as herein shown and described.

36,045. SHIELD. HENRY A. KELLER, New York, N. Y. Filed Aug. 12, 1902. Serial No. 119,691. Term of patent 7 years.

Claim.—The ornamental design for a shield, substantially as herein shown and described.

36,046. ANDIRON. THOMAS H. DUDGEON, Crafton, Pa., assignor to Pittsburgh Stove and Range Company, Pittsburg, Pa., a Corporation of Pennsylvania. Filed July 29, 1902. Serial No. 117,567. Term of patent 7 years.

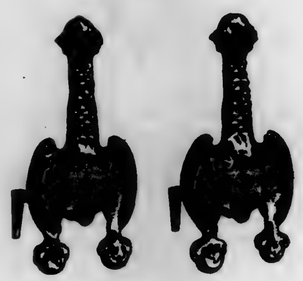


Claim.—The ornamental design for an andiron as herein shown and described.

36,047. ANDIRON. THOMAS H. DUDGEON, Crafton, Pa., assignor to Pittsburgh Stove and Range Company, Pittsburg, Pa., a Corporation of Pennsylvania. Filed July 29, 1902. Serial No. 117,567. Term of patent 7 years.

Claim.—The ornamental design for an andiron as herein shown and described.

36,048. ANDIRON. THOMAS M. DUDGEON, Crafton, Pa., assignor to Pittsburgh Stove and Range Company, Pittsburg, Pa., a Corporation of Pennsylvania. Filed July 29, 1902. Serial No. 117,568. Term of patent 7 years.



Claim.—The ornamental design for an andiron as herein shown and described.

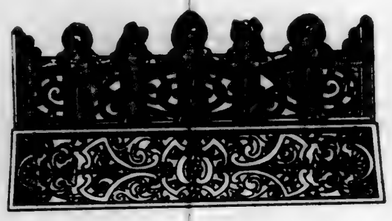
36,049. ANDIRON. THOMAS M. DUDGEON, Crafton, Pa., assignor to Pittsburgh Stove and Range Company, Pittsburg, Pa., a Corporation of Pennsylvania. Filed July 29, 1902. Serial No. 117,569. Term of patent 7 years.

Claim.—The ornamental design for an andiron as herein shown and described.

36,050. PORTABLE BASKET-GRATE. THOMAS M. DUDGEON, Crafton, Pa., assignor to Pittsburgh Stove and Range Company, Pittsburg, Pa., a Corporation of Pennsylvania. Filed July 29, 1902. Serial No. 117,570. Term of patent 7 years.

Claim.—The ornamental design for a portable basket-grate as herein shown and described.

36,051. BASKET-GRATE. THOMAS M. DUDGEON, Crafton, Pa., assignor to Pittsburgh Stove and Range Company, Pittsburg, Pa., a Corporation of Pennsylvania. Filed July 29, 1902. Serial No. 117,571. Term of patent 7 years.



Claim.—The ornamental design for a basket-grate as herein shown and described

36,852. BASKET-GRATE. THOMAS M. DUDGEON, Crafton, Pa., assignor to Pittsburgh Stove and Range Company, Pittsburg, Pa., a Corporation of Pennsylvania. Filed July 29, 1902. Serial No. 117,572. Term of patent 7 years.

Claim.—The ornamental design for a basket-grate as herein shown and described.

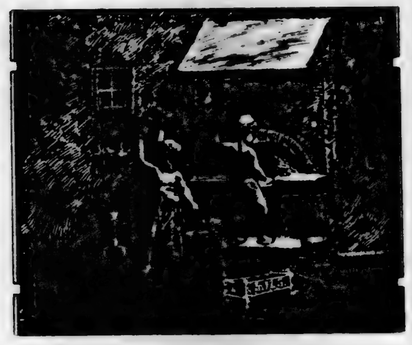
36,053. BASKET-GRATE. THOMAS M. DUDGEON, Crafton, Pa., assignor to Pittsburgh Stove and Range Company, Pittsburg, Pa., a Corporation of Pennsylvania. Filed July 29, 1902. Serial No. 117,573. Term of patent 7 years.

Claim.—The ornamental design for a basket-grate as herein shown and described.

36,054. BASKET-GRATE. THOMAS M. DUDGEON, Crafton, Pa., assignor to Pittsburgh Stove and Range Company, Pittsburg, Pa., a Corporation of Pennsylvania. Filed July 29, 1902. Serial No. 117,574. Term of patent 7 years.

Claim.—The ornamental design for a basket-grate as herein shown and described.

36,055. FIREPLACE-LINING. THOMAS M. DUDGEON, Crafton, Pa., assignor to Pittsburgh Stove and Range Company, Pittsburg, Pa., a Corporation of Pennsylvania. Filed July 29, 1902. Serial No. 117,575. Term of patent 7 years.



Claim.—The ornamental design for a fireplace-lining as herein shown and described.

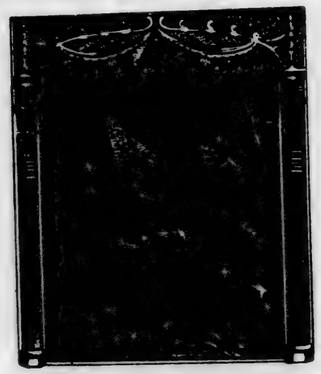
36,056. FIREPLACE-LINING. THOMAS M. DUDGEON, Crafton, Pa., assignor to Pittsburgh Stove and Range Company, Pittsburg, Pa., a Corporation of Pennsylvania. Filed July 29, 1902. Serial No. 117,576. Term of patent 7 years.

Claim.—The ornamental design for a fireplace-lining as herein shown and described.

36,057. FIREPLACE-LINING. THOMAS M. DUDGEON, Crafton, Pa., assignor to Pittsburgh Stove and Range Company, Pittsburg, Pa., a Corporation of Pennsylvania. Filed Aug. 16, 1902. Serial No. 119,972. Term of patent 7 years.

Claim.—The ornamental design for a fireplace-lining as herein shown and described.

36,058. FIREPLACE-FRONT. THOMAS M. DUDGEON, Crafton, Pa., assignor to Pittsburgh Stove and Range Company, Pittsburg, Pa., a Corporation of Pennsylvania. Filed July 29, 1902. Serial No. 117,577. Term of patent 7 years.

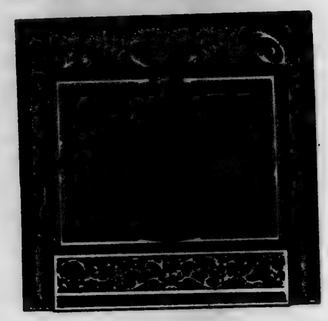


Claim.—The ornamental design for a fireplace-front as herein described and shown.

36,059. FIREPLACE-FRONT. THOMAS M. DUDGEON, Crafton, Pa., assignor to Pittsburgh Stove and Range Company, Pittsburg, Pa., a Corporation of Pennsylvania. Filed July 29, 1902. Serial No. 117,578. Term of patent 7 years.

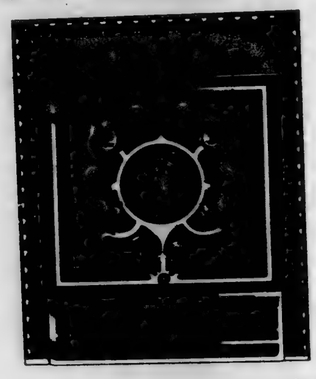
Claim.—The ornamental design for a fireplace-front as herein described and shown.

36,060. FIREPLACE-FRONT. THOMAS M. DUDGEON, Crafton, Pa., assignor to Pittsburgh Stove and Range Company, Pittsburg, Pa., a Corporation of Pennsylvania. Filed July 29, 1902. Serial No. 117,578. Term of patent 7 years.



Claim.—The ornamental design for a fireplace-front as herein described and shown.

36,061. FIREPLACE-FRONT. THOMAS M. DUDGEON, Crafton, Pa., assignor to Pittsburgh Stove and Range Company, Pittsburg, Pa., a Corporation of Pennsylvania. Filed July 29, 1902. Serial No. 117,580. Term of patent 7 years.

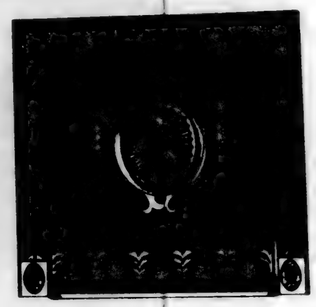


Claim.—The ornamental design for a fireplace-front as herein shown and described.

36,062. FIREPLACE-FRONT. THOMAS M. DUDGEON, Crafton, Pa., assignor to Pittsburgh Stove and Range Company, Pittsburg, Pa., a Corporation of Pennsylvania. Filed July 29, 1902. Serial No. 117,581. Term of patent 7 years.

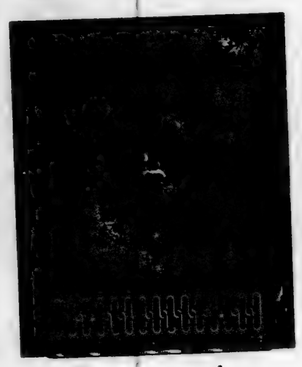
Claim.—The ornamental design for a fireplace-front as herein described and shown.

36,063. FIREPLACE-FRONT. THOMAS M. DUDGEON, Crafton, Pa., assignor to Pittsburgh Stove and Range Company, Pittsburg, Pa., a Corporation of Pennsylvania. Filed July 29, 1902. Serial No. 117,582. Term of patent 7 years.



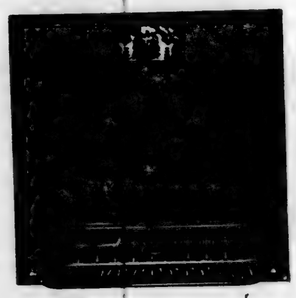
Claim.—The ornamental design for a fireplace-front as herein described and shown.

36,064. FIREPLACE-FRONT. THOMAS M. DUDGEON, Crafton, Pa., assignor to Pittsburgh Stove and Range Company, Pittsburg, Pa., a Corporation of Pennsylvania. Filed July 29, 1902. Serial No. 117,583. Term of patent 7 years.



Claim.—The ornamental design for a fireplace-front as herein described and shown.

36,065. FIREPLACE-FRONT. THOMAS M. DUDGEON, Crafton, Pa., assignor to Pittsburgh Stove and Range Company, Pittsburg, Pa., a Corporation of Pennsylvania. Filed July 29, 1902. Serial No. 117,584. Term of patent 7 years.



Claim.—The ornamental design for a fireplace-front as herein described and shown.

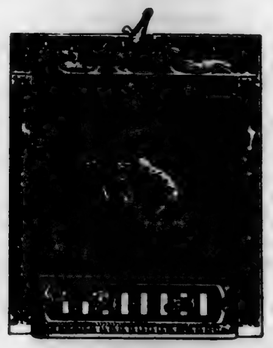
36,066. FIREPLACE-FRONT. THOMAS M. DUDGEON, Crafton, Pa., assignor to Pittsburgh Stove and Range Company, Pittsburg, Pa., a Corporation of Pennsylvania. Filed July 29, 1902. Serial No. 117,585. Term of patent 7 years.

Claim.—The ornamental design for a fireplace-front as herein described and shown.

36,067. FIREPLACE-FRONT. THOMAS M. DUDGEON, Crafton, Pa., assignor to Pittsburgh Stove and Range Company, Pittsburg, Pa., a Corporation of Pennsylvania. Filed July 29, 1902. Serial No. 117,586. Term of patent 7 years.

Claim.—The ornamental design for a fireplace-front as shown and described.

36,068. FIREPLACE-FRONT. THOMAS M. DUDGEON, Crafton, Pa., assignor to Pittsburgh Stove and Range Company, Pittsburg, Pa., a Corporation of Pennsylvania. Filed July 29, 1902. Serial No. 117,587. Term of patent 7 years.



Claim.—The ornamental design for a fireplace-front as herein described and shown.

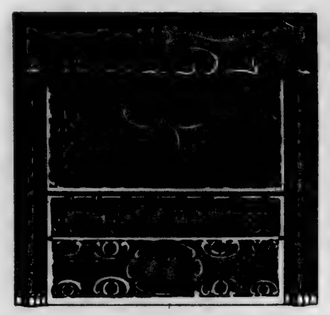
36,069. FIREPLACE-FRONT. THOMAS M. DUDGEON, Crafton, Pa., assignor to Pittsburgh Stove and Range Company, Pittsburg, Pa., a Corporation of Pennsylvania. Filed July 29, 1902. Serial No. 117,588. Term of patent 7 years.

Claim.—The ornamental design for a fireplace-front as described and shown.

36,070. FIREPLACE-FRONT. THOMAS M. DUDGEON, Crafton, Pa., assignor to Pittsburgh Stove and Range Company, Pittsburg, Pa., a Corporation of Pennsylvania. Filed July 29, 1902. Serial No. 117,589. Term of patent 7 years.

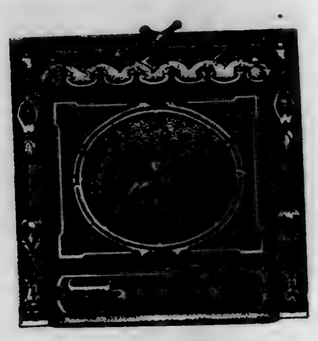
Claim.—The ornamental design for a fireplace-front as shown and described.

36,071. FIREPLACE-FRONT. THOMAS M. DUDGEON, Crafton, Pa., assignor to Pittsburgh Stove and Range Company, Pittsburg, Pa., a Corporation of Pennsylvania. Filed July 29, 1902. Serial No. 117,590. Term of patent 7 years.



Claim.—The ornamental design for a fireplace-front as shown and described.

36,072. FIREPLACE-FRONT. THOMAS H. DUDGEON, Crafton, Pa., assignor to Pittsburgh Stove and Range Company, Pittsburg, Pa., a Corporation of Pennsylvania. Filed July 29, 1902. Serial No. 117,501. Term of patent 7 years.



Claim.—The ornamental design for a fireplace-front as herein described and shown.

36,073. FIREPLACE-FRONT. THOMAS H. DUDGEON, Crafton, Pa., assignor to Pittsburgh Stove and Range Company, Pittsburg, Pa., a Corporation of Pennsylvania. Filed July 29, 1902. Serial No. 117,502. Term of patent 7 years.

Claim.—The ornamental design for a fireplace-front as herein described and shown.

TRADE-MARKS

REGISTERED SEPTEMBER 9, 1902.

38,872. STYLOGRAPHIC AND FOUNTAIN PENS. J. ULLMAN & Co., New York N. Y. Filed Aug. 7, 1902.

KOMPETEER.

The word "KOMPETEER." Used since July 31, 1902.

38,873. GAGE-GLASSES. JOHN H. LOUDENAN, Philadelphia, Pa. Filed July 17, 1902.

THISTLE

The word "THISTLE." Used since January, 1897.

38,874. OPTICAL LENSES. THEODORE ROOSEVELT, New York, N. Y. Filed July 30, 1902.

Neeranfar

The word "NEERANFAR." Used since April 1, 1902.

38,875. HATS. J. T. ADAMS & SONS, New York, N. Y. Filed Aug. 13, 1902.

RED ROVER

The words "RED ROVER." Used since January 1, 1902.

38,876. LEATHER BOOTS AND SHOES. SUTHERLAND CARPENTER & TELLING, Chicago, Ill. Filed June 13, 1902.

IROQUOIS

The word "IROQUOIS." Used since January 15, 1902.

38,877. CERTAIN NAMED LEATHER GOODS, TRIMMINGS, AND HARDWARE. GARCIA SUAREZ & Co., Manzanillo, Cuba. Filed July 30, 1902.

The phrase "LA PALMA," which appears upon a border surrounding a panel, on which panel the representation of a tropical scene is produced, a palm-tree occupying a prominent position in the foreground and a portion of a coast-line appearing in the background, a scroll being produced below the said panel, while a second scroll appears to cross the panel on which the tropical scene is produced. Used since 1892.

38,878. CERTAIN NAMED HOSPITAL AND SICK-ROOM APPLIANCES. MEDERER & Co., New York, N. Y. Filed June 3, 1902.

The word "PROGRESS," placed upon the horizontal bar of a Greek cross. Used since January 1, 1902.

88,879. ARSENIC COMPOUNDS. Vereinigte Chemische Werke Actiengesellschaft, Charlottenburg, Germany. Filed Apr. 28, 1902.

ATOXYL

The word "Atoxyl." Used since February 27, 1902.

88,880. REMEDY FOR CERTAIN NAMED DISEASES. Henry A. Sulzer, Pittsburg, Pa. Filed Jan. 4, 1902.

The words "Tossa Cura," together with the representation of the head and shoulders of a man, the face representing the man as suffering. Used since November 1, 1901.

88,881. REMEDIES IN CAPSULE, TABLET, OR SALVE FORM FOR THE CURE OF CERTAIN NAMED DISEASES. Benton H. Dunn, Buffalo, N. Y. Filed July 11, 1902.

The representation of a male figure standing on a portion of a globe and having a cloth around his waist, his left arm being extended and having a club held in the hand thereof, the whole being surrounded by concentric circles of contrasting colors. Used since June 19, 1902.

88,882. MEDICAL TONIC. Andrew J. Hill, Minerva, Ohio. Filed July 21, 1902.

PREPARIA.

The word "Preparia." Used since January 1, 1901.

88,883. PLAYER. Ammon Gast, Williamsport, Pa. Filed June 12, 1902.

88,888.

The words "The Specialist" and the medallion portrait of the registrant and the representation of peanuts below said picture, one of said peanuts having half of the shell removed. Used since May 20, 1900.

88,884. SALT. Diamond Crystal Salt Company, St. Clair, Mich. Filed May 17, 1902.

A diamond-shaped figure on which is shown a receptacle for salt. Used since September 1, 1901.

88,885. SHOE AND LEATHER DRESSING. The Ravis Glass Manufacturing Company, New York, N. Y. Filed July 19, 1902.

The representation of a person in military costume. Used since December 31, 1900.

88,886. LAUNDRY CREAM. Louis Loshbaugh, Jr., New York, N. Y. Filed July 9, 1902.

The word "Waxole," appearing on a rectangular background. Used since August 15, 1899.

88,887. CERTAIN NAMED CLEANING AND POLISHING COMPOUNDS. The Brunswig-Baled-Collender Company, Cincinnati, Ohio, and Chicago, Ill. Filed Apr. 17, 1902.

The word "Easybright," represented on a signboard held up by a lion rampant. Used since April 8, 1902.

88,888. DRY LAMPBLACK. The L. Martin Company, New York, N. Y. Filed July 3, 1902.

The representation of a plastic seal, upon which is displayed a conventionalized star with an open center, the letters "L. M. & Co." in plain type, appearing in the center of the seal, the "O" being inside the "C." Used since June 17, 1902.

88,889. CEMENT PAINT. S. & T. Hall, Limited, Hull, England. Filed July 3, 1902.

NONEX

The word "Nonex." Used since May 15, 1899.

88,890. MIXED PAINTS. Hollywood Paint Company, Buffalo, N. Y. Filed May 15, 1902.

The word "Hollywood" upon a seal and the representation of a sprig of holly. Used since May 1, 1901.

88,891. PAINT, PAINT-OIL, AND VARNISH. Charles P. Goodyear, Sr., Brunswick, Ga. Filed July 30, 1902.

TRIMAX

The word "Trimax." Used since May 1, 1902.

88,892. WOOD-FILLERS AND PRIMERS. The David B. Green Rubber Company, Bridgeport, Conn. Filed Aug. 6, 1902.

Primelac.

The word "Primelac." Used since July 1, 1902.

88,893. COMPOSITION FIRE-KINDLER. Henry G. Sachse, St. Louis, Mo. Filed Mar. 4, 1902.

K-K

The hyphenated letters "K-K." Used since February 1, 1902.

88,894. CERTAIN NAMED STEAM, WATER, AND GAS FITTINGS. WALWORTH MANUFACTURING COMPANY, Boston, Mass. Filed June 11, 1902.

WALMANCO

The word "WALMANCO." Used since March 1, 1902.

88,895. VENTILATING-DAMPERS, DRAFT-REGULATORS, AND SMOKE-PREVENTING APPARATUS. ADOLIPYLE COMPANY, New York, N. Y. Filed May 14, 1902.

Adolipyle

The word "ADOLIPYLE." Used since October 1, 1898.

THE NORRIS PETERS CO. PHOTO-LITH. WASH. D. C.

LABELS

REGISTERED SEPTEMBER 9, 1902.

9,426.—*Title:* "MISSION BRAND." (For Apricots.) THE SANTA PAULA COMMERCIAL CO., Santa Paula, Cal. Filed August 13, 1902.

9,427.—*Title:* "ORCHARD BRAND." (For Apricots.) THE SANTA PAULA COMMERCIAL CO., Santa Paula, Cal. Filed August 13, 1902.

9,428.—*Title:* "MAYFLOWER." (For Beer.) IMPERIAL BREWING CO., Kansas City, Mo. Filed August 18, 1902.

9,429.—*Title:* "MAYFLOWER." (For Beer.) IMPERIAL BREWING CO., Kansas City, Mo. Filed August 18, 1902.

9,430.—*Title:* "BEN KING." (For Cigars.) BEN KING CIGAR CO., St. Joseph, Mich. Filed July 19, 1902.

9,431.—*Title:* "NA-BOCKLISH." (For Cigars.) CENTRAL CIGAR MANUFACTURING CO., New York, N. Y. Filed August 16, 1902.

9,432.—*Title:* "GOLD BORE." (For Cigars.) SCHMIDT & CO., New York, N. Y. Filed August 15, 1902.

9,433.—*Title:* "THE WIN." (For Cigars.) JOHN WEISS, Jr., Saginaw, Mich. Filed August 18, 1902.

9,434.—*Title:* "MY BISCUIT." (For Biscuit.) THE SANITARY MY-FOOD CO., LIMITED, Battlecreek, Mich. Filed August 18, 1902.

9,435.—*Title:* "MANOR HOUSE." (For Coffee.) W. F. MCLAUGHLIN & CO., Chicago, Ill. Filed August 19, 1902.

9,436.—*Title:* "FILIPIN-O-KETCHUP." (For Catsup.) M. WOLFF & SONS, Chicago, Ill. Filed August 18, 1902.

9,437.—*Title:* "HY-STEP." (For Medicine.) JACOB FLOOK, Omaha, Nebr. Filed August 18, 1902.

9,438.—*Title:* "VAN WINKLE'S MEDICATED SOAP." (For Medicated Soap.) EDWARD VAN WINKLE & CO., Battlecreek, Mich. Filed August 14, 1902.

9,439.—*Title:* "EMPRESS IMPERIAL TOILET POWDER." (For Toilet Powder.) EUGENIA SHARP, Kansas City, Mo. Filed August 14, 1902.

9,440.—*Title:* "GOLDEN LUSTRE METAL POLISH." (For Metal-Polish.) CHARLES R. HULLEY & CO., Brooklyn, N. Y. Filed June 7, 1902.

PRINTS

REGISTERED SEPTEMBER 9, 1902.

555.—*Title:* "MEN'S AND BOYS' APPAREL." (For Men's and Boys' Apparel.) W. C. BOYS, Chicago, Ill. Filed August 16, 1902.

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF

UNITED STATES COURTS IN PATENT CASES.

COMMISSIONER'S DECISIONS.

EX PARTE TRAUDT.

Decided December 17, 1901.

TRADE-MARKS—DESCRIPTIVE—"DR. HOFFMANN'S DROPS."

"Dr. Hoffmann's Drops" refused registration as a trade-mark for medicine, since "Hoffmann" is an ordinary surname and "Drops" is descriptive.

ON appeal.

TRADE-MARK FOR CHOLERA, ETC., REMEDY.

Application of Frank Traudt filed March 14, 1899, No. 57,924.

Messrs. Higdon & Longan for the applicant.

ALLEN, *Commissioner:*

This is an appeal from the action of the Examiner of Trade-Marks refusing to register the words "Dr. Hoffmann's Drops" as a trade-mark for medicine.

The word "Drops" is a term ordinarily used to describe medicines of certain kinds, and therefore it is clearly descriptive. It cannot alone constitute a valid trade-mark and is not rendered registrable by being associated with words which are not themselves registrable. The word "Hoffmann" is a common surname and with the prefix "Dr." indicates that the medicine originated with some physician by the name of Hoffmann. There is nothing fanciful or arbitrary about the mark as a whole, and therefore it was properly refused registration.

The decision of the Examiner of Trade-Marks is affirmed.

EX PARTE KENYON.

Decided February 24, 1902.

TRADE-MARK—"CATARRHAL JELLY"—NOT REGISTRABLE.

The words "Catarrhal Jelly" as a trade-mark for a jelly-like remedy for catarrh *Held* descriptive and not registrable.

ON appeal.

TRADE-MARK FOR MEDICAL REMEDIES.

Application of Thomas N. Kenyon filed November 21, 1901, No. 64,516.

Mr. Frederick S. Lyon for the applicant.

ALLEN, *Commissioner:*

This is an appeal from the decision of the Examiner of Trade-Marks refusing to register the words "Catarrhal Jelly" as a trade-mark for remedies for catarrh and other diseases of the nose, throat, and lungs.

The words for which registration is sought are clearly descriptive of a remedy for catarrh, which remedy is of a jelly-like character. Any one purchasing this article to which these words are applied would expect to get a remedy of such character. These words are therefore descriptive and not fanciful or arbitrary. They do not serve to indicate the origin or ownership of the remedy, for any one would have the right to apply the same descriptive terms to a similar article.

It is well settled that words which are descriptive of the character, quality, or ingredients are not to be registered as technical trade-marks.

The decision of the Examiner of Trade-Marks is correct, and it is accordingly affirmed.

BLACKMAN *v.* ALEXANDER.

Decided April 9, 1902.

SUPPRESSION OF TESTIMONY—REOPENING INTERFERENCE.

Where testimony is suppressed because of irregularities in the taking thereof and it appears that the irregularities were due entirely to inadvertence and not to an intention to delay the proceedings, *Held* that the party should be given an opportunity to retake the testimony.

ON petition.

WOOD FLOORINGS.

Application of John J. Blackman filed January 14, 1901, No. 43,141. Application of Samuel Alexander filed October 25, 1900, No. 34,260.

Mr. Francis H. Richards for Blackman. (*Mr. C. A. Weed* of counsel.)

Messrs. Seymour & Earle for Alexander.

ALLEN, *Commissioner:*

This is a petition by Alexander asking—

First. For leave to file another petition for leave to file Alexander's proofs and exhibits upon the showing made by certain affidavits aforesaid and accompanying this petition.

Second. That in case this permission is refused, a stay of proceedings be granted and an opportunity be given for the notary before whom the testimony was taken to file the same after her return from abroad.

Third. That if both these requests be denied, the Examiner of Interferences be directed "to set times for the retaking of Alexander's proofs *de novo*."

Fourth. For a suspension of all proceedings pending the determination of the questions raised by the several prayers of this petition.

The testimony offered in behalf of Alexander has been suppressed because of certain irregularities in the taking thereof which have been heretofore fully considered. (See the decision in *Blackman v. Alexander*, 98 O. G., 1281, and *Blackman v. Alexander*, 73 MS. Dec., 274.) The reasons for the suppression of this testimony have been fully set forth in the decisions above noted and need not be

stated again. It is sufficient to say that the showing in the affidavits presented in support of the first prayer of the petition is insufficient to warrant the granting of permission to file the testimony now; nor can the defects in this testimony be overcome if the notary before whom it was taken should file the same. In so far, therefore, as the present petition seeks to have Alexander's suppressed testimony received and considered it is denied.

Although in compliance with the established rules of evidence it was necessary to suppress Alexander's testimony because of the irregularities in the taking thereof, the exceptions to which testimony have not been waived by the opposing party, yet in the present case justice requires that Alexander should not be compelled to go to trial without testimony in his behalf. It sufficiently appears that the irregularities arose through inadvertence and not through any desire to delay proceedings on Alexander's part. It is desirable that the Office have all the facts before it in the determination of the question of priority of invention, and the consideration of the facts should not be prevented through mere technicalities. In the absence of any waiver of objections to the testimony in behalf of Alexander by the opposing party it is considered to be best for all concerned that this testimony be retaken.

This case is therefore remanded to the Examiner of Interferences, who will set times for the retaking of Alexander's testimony *de novo*. To this extent the petition is granted.

DECISIONS OF THE U. S. COURTS.

Court of Appeals of the District of Columbia.

OLIVER *v.* FELBEL.

Decided June 6, 1902.

1. INTERFERENCE—APPEAL TO COURT—ISSUE UNPATENTABLE—MOOT QUESTION.

The court should not be called upon to decide priority between rival claimants to an invention where the Patent Office expressly reserves for future consideration the question of patentability of the invention. It is not the province of the court to decide moot causes.

2. SAME—PATENTABILITY A PREREQUISITE TO INTERFERENCE—JURISDICTION OF COURT.

Patentability of the invention is a necessary prerequisite to the declaration of an interference, and the court is without jurisdiction in a case where there is not a final favorable decision on that question by the Patent Office.

3. SAME—PATENTABILITY DOUBTFUL—PRACTICE.

Where a question as to the patentability of the invention is raised by some tribunal of the Patent Office after the declaration of an interference, *Held* that it should be finally settled before a decision on priority is rendered which entitles the defeated party to appeal to the court.

4. PATENTABILITY OF INVENTION—JURISDICTION TO VACATE FAVORABLE DECISION.

Until the patent is actually issued it is always competent for the Patent Office, with due regard to the rules of law, to vacate its favorable adjudication upon the question of patentability for good and sufficient cause.

5. INTERFERENCE—PRIORITY—DISCLAIMER OF INVENTION.

Where O. deliberately states in answer to a question propounded by his own counsel that he does not claim to be the inventor of the matter in controversy, *Held* that priority of invention cannot be awarded to him.

6. SAME—DELAY—PRESUMPTIVE EVIDENCE.

Long and unexplained delay yielding to activity only when the knowledge comes of the entrance of a rival on the field is always presumptive evidence that what is claimed to have been a reduction to practice was no more than an unsatisfactory or abandoned experiment.

7. SAME—DILIGENCE.

The diligence required of an inventor is diligence rather in the reduction of his invention to practice than in application to the Patent Office or in manufacturing his device for public use.

8. SAME—REDUCTION TO PRACTICE—CONCEALMENT OF INVENTION.

When reduction to practice by the first inventor is shown, his right to a patent is not barred by delay thereafter unless there be some circumstance of concealment, suppression, or abandonment of the invention.

Messrs. Poole & Brown for the appellant.

Mr. Wm. W. Dodge for the appellee.

MORRIS, *J.*:

This is an appeal from the decision of the Commissioner of Patents in an interference case, wherein the subject-matter of controversy is an alleged improvement in type-writing machines, described in the following one issue in the cause:

In a type-writing machine, the combination with type-operating mechanism and a power-driven carriage, of a tabulating mechanism including a series of denomination-keys and a series of independently-movable stops connected thereto, and also including an independent release-key for the carriage, the construction and arrangement being such that any key may be operated to set its corresponding stop, and such that said release-key may then be operated to enable the carriage to move rapidly to the point determined by the setting of said stop.

The alleged invention consists in the separation of the release-key from the denomination-keys of the tabulating mechanism, a separation which the appellant claims to be a step backward in the art, and which, notwithstanding that he accepted the issue as formulated in the Patent Office, he now seeks to have regarded as wanting in patentable novelty, but which the appellee claims to have the effect of removing certain tendencies in previously-existing mechanism to superinduce mistakes on the part of the operator.

The appellant Oliver filed his application for patent on July 17, 1899, and is the senior applicant. In his preliminary statement he alleged that he had conceived the invention, disclosed the same, and made drawings of it, during the period between April 7 and May 7, 1899; that he had constructed a full-sized operative machine embodying the invention between May 1 and June 1, 1899; and that since June 1, 1899, large numbers of such machines had been manufactured and sold.

The appellee Jacob Felbel filed his application for patent on December 18, 1899, which was five months later than the application of his opponent. In his preliminary statement he alleged that he had conceived the invention in issue, made sketches and drawings of it, and began the construction of full-sized working drawings, on or about May 20, 1898; that he showed these drawings, and explained the invention to others about May 25, 1898; that the construction of a full-sized machine, embodying the invention, was immediately commenced and was completed on or about July 20, 1898; and that this machine was immediately and repeatedly thereafter successfully operated.

Testimony was taken which showed that the allegations of the parties were substantially correct, and that Felbel had anticipated his rival. Whereupon all the tribunals of the Patent Office concurred in awarding judgment of priority of invention in favor of Felbel, and Oliver has appealed.

It appears from the record that the claim of the issue was the second of 73, afterward enlarged to 83 claims, contained in Felbel's application; that it was not originally claimed by Oliver; but that it was suggested to the latter by the Patent Office in accordance with its practice, in view of Felbel's application then pending. The suggestion was accepted by Oliver; and this claim was added by him as an amendment to his original specification, with the distinct understanding that thereby he would be placed in interference with a rival claimant. Notwithstanding this, after the interference had been declared, Oliver repeatedly moved for its dissolution, on the ground that there was no interference in fact between the devices of the two parties, and that the issue, when properly construed, according to his construction of it, applied specifically to Felbel's device, but did not cover his own. And when his motions for a dissolution of the interference had been overruled, he urged that the claim of the issue was old, and was therefore wanting in patentable novelty.

None of these contentions received any favor from the Examiner of Interferences. But the Board of Examiners-in-Chief, while affirming the decision of the Examiner of Interferences and awarding judgment of priority to Felbel, were of opinion that the claim was not patentable, and called the attention of the Commissioner to the fact. The Commissioner expressed no opinion as to the patentability of the claim, but stated that this could be considered by the Primary Examiner when the case should go back to him after the determination of the interference; and he affirmed the award of priority to Felbel.

In view of this condition of the record, we are not sure that we have jurisdiction to determine the issue in this case. The authority conferred on this court by the act creating it is, in reference to interference cases appealed to it from the decision of the Commissioner of Patents, to review the action of the Commissioner determining the right of priority of two or more persons claiming the same patentable invention. In the sense of the patent law there can be no interference unless there is patentable invention and there are rival claimants of it. Patentability of the invention or device is a necessary prerequisite to a declaration of interference; and the patentability of an invention, in controversy, except under some extraordinary circumstances, is not an open question before us. It is necessarily assumed in the declaration of interference, and the parties are estopped from denying it. It would be absurd and inconsistent to make application for a patent for an alleged invention, and immediately thereafter, when some one else claims the same invention, to argue against its patentability.

We understand the rules and the practice of the Patent Office to be in accordance with this requirement of law and right reason; and that no interference is ever declared between parties until there has been an adjudication of patentability. The absurdity of a declaration of interference, with a reservation at the same time of the question of patentability for future adjudication, would be, so far at least as this court is concerned, too glaring to be tolerated. Of course, it is always possible that, even after a *prima facie* adjudication of patentability, facts may be disclosed, in the course of interference proceedings or otherwise, which would make it the duty of the Patent Office to refuse a patent, notwithstanding the preliminary adjudication. And it may be admitted that, until the patent is actually issued, it is always competent for the Patent Office, with due regard to the rules of law, to vacate its adjudication for good and sufficient cause. But that there must be an adjudication of patentability, final to all ordinary intents and purposes, before this court can be called upon to determine the right of ownership as between rival claimants, we must regard as the demand of the statute. Otherwise, we would be trying moot causes, which it is not the province of any court of justice under our judicial system to try; or else we would be called upon to perform duties which are not judicial in their nature, and which, under our system of government, it is not competent for the Legislature to impose upon judicial tribunals.

In the case now before us there would seem to be no final and definite adjudication of patentability of the invention or device in controversy. It is true that the Primary Examiner has passed upon it, and has adjudged it to be patentable. But the Board of Examiners has expressed a different opinion; and while that opinion has not the effect, under the circumstances and the rules of the Patent Office, of overruling the Primary Examiner, and the Board can only call the attention of the Commissioner to the matter, which it has done, yet the Commissioner has virtually adopted the suggestion, and has held the question of patentability in abeyance to be reconsidered by the Primary Examiner when the matter goes back to him.

It is, of course, competent for the Patent Office to regulate its business in its own way, and to determine for itself by its own rules when and in what order it will take up the questions which arise in the performance of its functions. But, as we have said, this court cannot be called upon to determine moot causes; and the present is no more than a moot cause, since upon the face of the record itself the question of patentability has been expressly reserved for further and future consideration.

This question, however, has not been raised by either of the parties to the cause; but, as it very greatly affects our jurisdiction, we are compelled to raise it ourselves, and to suggest the grave doubt which exists in our minds whether we can assume jurisdiction in cases like the present.

But assuming that we have jurisdiction, we do not see what there is here for us to adjudicate.

invention cannot be awarded to him.

The appellant has distinctly and in the most positive manner, in the course of his testimony in the cause, disclaimed all interest in the subject-matter of controversy. Upon his examination as a witness on his own behalf, this question was deliberately propounded to him by his own counsel:

Do you claim to be the inventor of a device or mechanism embracing the particular combination of parts or elements specified in the issue of interference, as you understand them?

And his deliberate answer to the question was—

I do not.

Now we do not see the necessity or propriety of seeking to force upon a man the paternity of an invention which he so positively repudiates. In all probability this statement was made for the purpose of procuring a dissolution of the interference; but it matters not what the purpose of the appellant was in making it. It is a positive declaration under oath that he never was the inventor of the matter in issue. This we think should settle the controversy. Taken in connection with the appellant's contention before the Patent Office that the device of the claim was not patentable, it would show quite conclusively that the purpose of the appellant was rather to defeat his opponent than to procure a patent for himself.

Were we to go farther and to disregard this disclaimer of interest on the part of the appellant, we would still find that Felbel was the first and original inventor in this case, and not Oliver.

That Felbel's conception of the invention and all that he did in the way of reduction to practice antedated the conception of Oliver by several months, is abundantly proved, and we understand that it is not even contested by Oliver. But for the reason that Felbel was not diligent in coming to the Patent Office with an application, or in putting the invention on the market, and that in the meantime Oliver did put the invention on the market and promptly applied to the Patent Office for a patent, it is sought to bring this case within the ruling in *Mason* v. *Hepburn* (84 O. G., 147; 13 App. D. C., 86,) and *Warner* v. *Smith*, (84 O. G., 311; 13 App. D. C., 111.) We, however, concur with the Commissioner of Patents and the other tribunals of the Patent Office in holding that this case falls rather within the ruling in the cases of *Esty* v. *Newton*, (86 O. G., 799; 14 App. D. C., 50,) *McBerty* v. *Cook*, (90 O. G., 2295; 16 App. D. C., 133,) and the more recent case of *Roe* v. *Hanson* at the last term of this court. There was here no fraudulent concealment, no suppression of the invention to keep it from the public, no abandonment of it as of an unsuccessful experiment, no such unreasonable delay as to impose upon the claimant the burden of proof beyond a reasonable doubt. On the contrary, Felbel's delay in this instance does not seem to have been unreasonable under all the circumstances. He had placed his invention in the hands of the person to whom it was most natural for him to look to manufacture it for commercial use, which he was unable to do himself; and he withdrew it from him as soon as it became apparent to him that this person was not then disposed to take up the matter. He had constructed a practical operative machine; the reduction to practice had been complete: and all that remained to be done for the security of his right was to make his application for a patent. Undoubtedly it was possible for him to have done this more promptly than he did; but the delay was not unreasonable.

The diligence required of an inventor is diligence rather in the reduction of his invention to practice than in application to the Patent Office or in manufacturing his device for public use. It is very true, as we held in *Mason* v. *Hepburn*, *Warner* v. *Smith*, and other cases, that delay long and unexplained, and yielding to activity only when the knowledge comes of the entrance of a rival on the field, is always presumptive evidence that what is claimed to have been reduction to practice was no more in fact that an unsatisfactory or abandoned experiment. But when reduction to practice has been satisfactorily shown, and there is no unreasonable or unexplained delay, there is no law that would bar the first or original inventor of his right. In order to give to delay the effect of destroying such a right, there must be some circumstance of concealment, suppression or abandonment of the invention.

Notwithstanding our intimation that this cause, as now presented, is not ready for the appellate action of this court, we have deemed it proper to state our opinion upon the merits in view of the fact that neither party has raised the question of jurisdiction and we desire under the circumstances to save them the expense and delay of another appeal. Upon the merits, assuming the question of patentability of the alleged invention to have been definitely solved, we think that there was no error in the decision of the Commissioner of Patents.

In cases of this kind we think the proper practice to be, that the Commissioner, reserving, if he so desires, the determination of the question of interference, should hold the cause until he has referred the question of patentability back to the Examiner and there has been a definite adjudication of this latter question. Then, and not until then, his determination of the issue of interference would present a cause for our cognizance.

The clerk of the court will certify this opinion, and the proceedings in this court in the premises to the Commissioner of Patents, according to law.

Complete Applications.

It is hereby ordered that applications shall not be given serial numbers as complete applications and forwarded to the examining divisions for examination (1) when the petition has not been signed by the inventor; (2) when the specification and claims have not been signed by the inventor and the signature attested by two witnesses; (sec. 4888, Rev. Statu.;) (3) when the drawing has not been signed by the inventor or his attorney in fact and the signature attested by two witnesses; (sec. 4889, Rev. Statu.;) and (4) when the oath to the application does not fill the requirements of sections 4887 and 4888, Revised Statutes.

The requirements of section 4896, Revised Statutes, respecting the right of executor or administrator to make application for a patent for the invention of a deceased person must also be observed before the application will be considered as complete and forwarded for examination. The legal requirements in cases where the application is made by a foreign administrator are stated in *ex parte Ransome*, (C. D., 1870, 143.)

* * * * * * * * *

This order, so far as applicable, relates to applications for the registration of trade marks, labels, and prints, which must in all respects comply with the requirements of the statutes.

Inks.

(ORDER No. 37.)

All applications, communications, and other instruments in writing or print, which should properly constitute a permanent record in this Office, must be prepared with a substantially permanent ink. Aniline and other perishable inks will not be accepted.

Preparation of Specifications, Entry of Amendments, Etc.

LEGIBLE WRITING REQUIRED.

The specification and claims must be plainly written or printed on but one side of the paper. All interlineations and erasures must be clearly referred to in marginal or foot notes on the same sheet of paper. Legal-cap paper with the lines numbered is deemed preferable, and a wide margin must always be reserved upon the left-hand side of the page.

AMENDMENTS MUST BE SPECIFIC—HOW WRITTEN.

In every amendment the exact word or words to be stricken out or inserted in the application must be specified, and the precise point indicated where the erasure or insertion is to be made. All such amendments must be on sheets of paper separate from the papers previously filed, and written on but one side of the paper. Erasures, additions, insertions, or mutilations of the papers and records must not be made by the applicant.

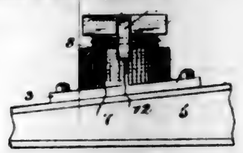
SPECIFICATIONS REWRITTEN.

When an amendatory clause is amended, it must be wholly rewritten, so that no interlineation or erasure shall appear in the clause, as finally amended, when the application is passed to issue. If the number or nature of the amendments shall render it otherwise difficult to consider the case, or to arrange the papers for printing or copying, the Examiner or Commissioner may require the entire specification to be rewritten.

PATENTS

GRANTED SEPTEMBER 16, 1902.

708,980. ADJUSTABLE TRUCK-BEARING. WALTER S. ADAMS, Philadelphia, Pa., assignor to John A. Brill, Philadelphia, Pa. Filed Mar. 7, 1902. Serial No. 97,022. (No model.)



Claim.—1. The combination in an article of the class described, of the base having an annular and interiorly-threaded hub, a head comprising a wear-plate, and a threaded stem engaging the interior thread of the said hub, and a lock extending from said wear-plate to said hub.

2. The combination in an article of the class described, of the base having an annular and interiorly-threaded and upwardly-extending hub, a recess formed in the outer surface, the head comprising the flanged wear-plate and the exterior-threaded spindle engaging the interior thread of the rim, and the latch pivoted to the said wear-plate, its free end being adapted to engage the said hub-recess.

3. The combination in an article of the class described, of a base comprising the rim, a depression formed within the rim, flanges extending from said rim, a screw-thread formed interiorly of the rim, the head comprising the flanged wear-plate and an exteriorly-threaded spindle engaging the thread of the rim, the latch pivotally supported by said flange-plate, and a recess in the rim to receive the free end of the latch.

708,981. NON-REFILLABLE BOTTLE. HENRY F. BAILEY, Denver, Colo., assignor of one-half to Lonzo E. Steele and Harry E. Sims, Denver, Colo. Filed Jan. 6, 1902. Serial No. 88,608. (No model.)

Claim.—1. In a non-refillable bottle, the combination of a bottle having a neck and throat portion, a valve-seat in said throat, a spherical valve seated on said valve-seat, a plurality of lugs arranged concentric to said valve-seat, arranged to confine said spherical valve in operative relation to said valve-seat, suitable liquid-passages from said valve-seat between said lugs past said spherical valve, a key in the throat of the neck of said bottle, a plug in the throat of said bottle, arranged to define the operative movement of said valve, a keyway in said plug arranged to fit over said key when said plug is inserted in said throat, and adapted to define the position of said plug relative to said valve, and a zigzag liquid-passage through said plug having a substantially right-angled offset in its course through said plug, substantially as described.

2. In a non-refillable bottle, the combination with a bottle provided with a neck and mouth and throat portion of a suitable valve-seat and valve in said throat, a plug in said throat containing a keyway, a key projecting from said throat into said keyway and adapted to define the position of said plug relative to said valve, means including a suitable agent for non-removably securing said plug in the neck of said bottle, a liquid-passage through said plug having an offset in its length arranged and adapted to prevent access to said valve from the mouth of said neck, and a suitable cork or stopper in the mouth of said throat, substantially as described.

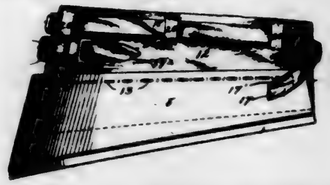
708,982. HORSESHOE. EDWIN D. RADER, Milwaukee, Wis., assignor of two-thirds to Archie L. Rodee and Edwin G. Bragg, Milwaukee, Wis. Filed Mar. 10, 1902. Serial No. 97,553. (No model.)

Claim.—1. A horseshoe having a screw-threaded nipple formed integrally therewith and projecting therefrom, in combination with a calk formed with a longitudinal screw-threaded bore removably secured to said nipple.

2. A horseshoe having a plane surface on its under side interrupted only by projecting screw-threaded nipples formed integrally therewith, and all of the same diameter and pitch of threads in combination with a series of calks, all provided with longitudinal screw-threaded bores of equal diameter and pitch, said calks being removably and interchangeably suited to said nipples.

3. A horseshoe-calk having a longitudinal-threaded bore and a squared exterior surface on the bored portion, one of the ends of the calk being flat, and the opposite end pointed, in combination with a horseshoe having an integral screw-threaded nipple projecting from its under surface.

708,983. OVERSHOE FOR HORSES. JOHN BARTLETT, Brooklyn, N. Y. Filed Apr. 17, 1902. Serial No. 103,249. (No model.)



Claim.—1. An overshoe or boot for animals comprising a tread portion; an elastic hoof-covering projecting from said tread portion; a flexible apron secured to said hoof-covering and to the tread portion, said apron being slit at its front and rear ends; and means for securing the apron, and thereby the overshoe, in place.

2. An overshoe or boot for animals comprising a resilient base having an opening and upwardly-extending walls; an apron secured to the inner sides of said walls and to the base, said apron being slit to enable it readily to conform to the outline of the hoof; straps secured to the walls of the base and passing through loops of the apron; and buckles attached to the apron and serving to retain the straps.

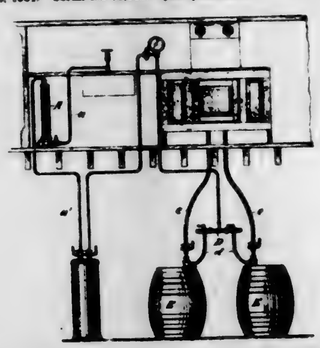
3. In an overshoe or boot for animals, the combination, with an elastic base having upwardly-extending walls conforming to the outline of the hoof, of a flexible apron secured to said walls at its front and sides

and to the base at its rear portion, said apron being slitted at front and rear; straps secured to the rear sides of the flexible walls of the base; loops upon the flexible apron through which the straps pass; and buckles secured to the apron upon the reverse sides of the slit at the forward portions thereof.

4. An overshoe or boot for animals comprising a flexible base having a longitudinal opening in its tread portion, and also having upwardly-extending, elastic walls; a flexible apron secured to the inner side of said upwardly-extending walls and to the rear part of the tread portion; straps attached to the walls of the base at one end; loops carried by the flexible apron and through which said straps pass; and buckles for the reception of the front ends of said straps.

5. In an overshoe or boot for horses, the combination, with a resilient base, of an apron secured to said base, said apron being slitted as described; straps secured to said base, the straps being crossed at the rear of the shoe and carried around the side of the apron opposite the side upon which they are secured to the base and being brought around the front of the apron; and buckles carried by the apron and to which the free ends of the straps are attached.

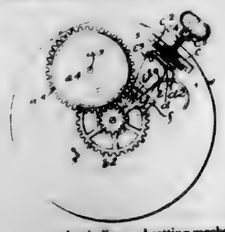
708,984. METHOD OF TREATING AIR FOR FORCING MALT LIQUORS FROM KEGS. CHARLES A. BASTLEY, St. Louis, Mo. Filed Nov. 8, 1901. Serial No. 81,612. (No specimens.)



Claim.—1. The herein-described method of treating air for forcing malt liquors from kegs, the same consisting in removing foreign particles from the air, passing the cleansed air through a chamber containing hop-leaves, and delivering the cleansed and impregnated air, under pressure, to the surface of malt liquor in a keg; substantially as described.

2. The herein-described method of treating air for use in forcing malt liquors from kegs, the same consisting in first compressing the air, then passing the same through a chamber containing a cleansing ingredient, then passing the air through a chamber containing dried hop-leaves, and finally delivering the cleansed and impregnated air, under pressure, to the surface of liquor in a keg; substantially as described.

708,985. STEM-WINDING WATCH. MORRIS RABBOTT, Brooklyn, N. Y. Filed May 12, 1902. Serial No. 106,871. (No model.)

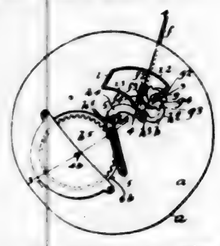


Claim.—1. In a watch winding and setting mechanism a barrel-shaft provided with a gear-wheel, a center arbor provided with a pinion, a gear-wheel operating in connection with said pinion, a yoke provided with a pinion normally in engagement with the gear-wheel on the barrel-shaft and adapted to be thrown into engagement with the gear-wheel which operates in connection with the pinion on the center arbor, a stationary plate, a wheel mounted on the inner side of said plate and provided with a hub which passes therethrough and is adapted to receive a pendant-stem longitudinally movable therein, and a plate pivoted between said wheel and said yoke and adapted to be operated by the pendant-stem, said last-named plate being adapted to operate said yoke, substantially as shown and described.

2. In a watch winding and setting mechanism a barrel-shaft provided with a gear-wheel, a center arbor provided with a pinion, a gear-wheel operating in connection with said pinion, a yoke provided with a pinion normally in engagement with the gear-wheel on the barrel-shaft and adapted to be thrown into engagement with the gear-wheel which operates in connection with the pinion on the center arbor, a stationary plate, a wheel mounted on the inner side of said plate and provided with a hub which passes therethrough and is adapted to receive a pendant-stem longitudinally movable therein and a plate pivoted between said wheel and said yoke and adapted to be operated by the pendant-stem, said last-named plate being adapted to operate said yoke, and a gear-wheel mounted between said last-named gear-wheel and the pinion carried by said yoke, substantially as shown and described.

3. In a watch winding and setting mechanism a barrel-shaft provided with a gear-wheel, a center arbor provided with a pinion, a gear-wheel operating in connection with said pinion, a yoke provided with a pinion, which normally engages the gear-wheel on the barrel-shaft, a plate secured transversely of the frame of the watch mechanism near one side thereof, a gear-wheel mounted at the inner side of said plate and provided with a hub which passes therethrough and is adapted to receive a pendant-stem, another gear-wheel mounted between said last-named gear-wheel and operating in connection therewith and in connection with the pinion carried by the yoke, and a plate pivoted at the inner side of the wheel through the hub of which the pendant-stem passes, said last-named plate being adapted to be operated by pendant-stem so as to operate said yoke, substantially as shown and described.

708,986. STOP-WATCH. MORRIS RABBOTT, Brooklyn, N. Y. Filed May 12, 1902. Serial No. 106,872. (No model.)



Claim.—1. In a fly-back attachment for watches, the combination with one of the plates of the frame of a watch mechanism, of a yoke-shaped spring secured to said plate at the middle thereof, a double cam-disk mounted on said plate, one member of which is in operative connection with one arm of said spring, and a lever adapted to engage with the other member of said cam-disk, said lever being in operative connection with the other arm of said spring, substantially as shown and described.

2. In a fly-back attachment for watches, the combination with one of the plates of the frame of the watch mechanism, of a yoke-shaped spring secured to said plate at the middle thereof, a double cam-disk mounted on said plate, one member of which is in operative connection with one arm of said spring, and a lever adapted to engage with the other member of said cam-disk, said lever being in operative connection with the other arm of said spring, and means for operating said double cam-disk, substantially as shown and described.

3. In a fly-back attachment for watches provided with a hollow main arbor, a center arbor longitudinally and rotatably movable therein and provided at one end with the usual sweep seconds-hand and at the other end with a heart-shaped cam and means for locking said center arbor to said main arbor as well as releasing the same; an operating-lever pivotally mounted at or near its center and adjacent to said center arbor, and provided with two curved projecting members which are wedge-shaped in longitudinal vertical section, and which are adapted to pass one on each side of said center arbor and engage, with their inclined surfaces, the under side of said heart-shaped cam, said operating-lever being also provided between the inner ends of said curved wedge-shaped members with a thickened projecting member which is wedge-shaped in transverse horizontal section, and adapted to engage the recess in the periphery of said heart-shaped cam, and means for operating said lever, substantially as shown and described.

4. In a fly back attachment for watches provided with a main arbor, a center arbor movable therein and provided at one end with a sweep

seconds-hand and at the other with a heart-shaped cam, and means for locking said center arbor to said main arbor and releasing it therefrom; a double cam-disk, an operating-lever one end of which is provided with wedge-shaped projecting members adapted to operate in connection with said heart-shaped cam and the other end of which is in operative connection with the outer member of said double cam-disk, a yoke-shaped spring one end of which operates on one end of said lever and the other end of which operates on the inner member of said double cam-disk, a spring-operated rod loosely mounted adjacent to said double cam-disk, and a pin secured at right angles thereto, and adapted to operate on the inner member of said double cam-disk, substantially as shown and described.

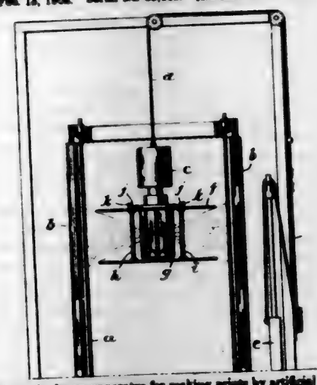
708,987. ICE-CREAM DIPPER. ERNST C. RAUSERMAN, Topeka, Kans. Filed Feb. 26, 1902. Serial No. 96,766. (No model.)

Claim.—An ice-cream dipper for forming Metropolitan ice-cream, consisting of the combination of a bowl having a perforated bottom, rib-like arms fitting against the bottom and sides thereof, an outside arm to which said rib-like arms are attached through said perforation, another arm projecting from said bowl, and a spring-handle connected to said arms respectively and adapted to rotate said bowl and said rib-like arms in opposite directions.

708,988. SPINNING-BAND. GEORGE M. BRADLE, Shickshinny, Pa. Filed Oct. 26, 1901. Serial No. 80,113. (No model.)

Claim.—A band having loops formed at the ends thereof, metallic eyes held in place by the loops, and a link engaging the eyes and provided intermediate of its length with a kink or bend disposed between the juncture of the loops and operating to hold it against turning in the eyes.

708,989. MACHINE FOR MAKING PRINTS. ROBERT A. BELL, Philadelphia, Pa., assignor to Charles A. Rutter, Philadelphia, Pa. Filed Feb. 13, 1902. Serial No. 93,818. (No model.)



Claim.—1. In an apparatus for making prints by artificial light, the combination of a glass platen, means for holding a negative and a sensitized surface against the platen, an artificial light movable across the platen, and means for protecting all portions of the platen except those opposite the light at any point in its travel from the rays of said light.

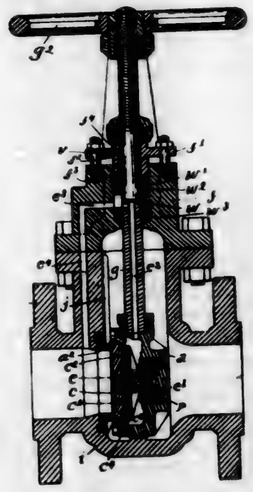
2. In an apparatus for making prints by artificial light, the combination of a glass platen, means for holding a negative and a sensitized surface against the platen, an artificial light movable across the platen, and screens moving with said light and preventing the rays thereof from striking the platen except at points opposite the light.

3. In an apparatus for making prints by artificial light, the combination of a glass platen, means for holding a negative and a sensitized surface against the platen, an artificial light movable vertically of the platen, and two screens moving with and arranged, respectively, above and below said light, the screens being arranged to prevent the rays of said light from striking the platen except at points opposite the light.

4. In an apparatus for making prints by artificial light, the combination of a glass platen, means for holding a negative and a sensitized surface against the platen, an artificial light movable vertically of the platen, and screens detachably connected to and moving with said light to prevent the passage of rays therefrom above or below said light.

5. In an apparatus for making prints by artificial light, the combination of a glass platen, means for holding a negative and a sensitized surface against the platen, an artificial light movable vertically of the platen, a disk or screen arranged above and moving with said light and acting to prevent the rays of said light from striking the platen above said disk, and a second disk or screen, arranged below the light and detachably connected to the first said screen, and acting to prevent the rays of said light from striking the platen below said lower disk.

708,990. VALVE. JOHN H. BICKFORD, Salem, Mass. Filed June 17, 1901. Serial No. 64,831. (No model.)



Claim.—1. In a valve, a carrier bearing a valve-plate and also bearing a pressure-chamber having a flexible element as a part of it, means for moving said carrier, means, as a passage, connecting said pressure-chamber with the pressure-supply, said pressure-chamber controlling the movements of said valve-plate laterally toward and from its seat as the pressure therein is controlled, and a valve for controlling the pressure in said chamber, substantially as described.

2. In a valve, a carrier bearing a valve-plate and also bearing a pressure-chamber having a flexible element as a part of it, means for moving said carrier, means, as a passage, connecting said pressure-chamber with the pressure-supply, said pressure-chamber controlling the movements of said valve-plate laterally toward and from its seat as the pressure therein is controlled, and a valve for controlling the pressure in said chamber operated by the means employed for moving the carrier, substantially as described.

3. In a valve, a carrier bearing a valve-plate and also bearing a pressure-chamber having a flexible element as a part of it, means for moving said carrier, means, as a passage, connecting said pressure-chamber with the pressure-supply, said pressure-chamber controlling the movements of said valve-plate laterally toward and from its seat as the pressure therein is controlled, and a manually-operated valve for controlling the pressure in said chamber, substantially as described.

4. In a valve, a carrier bearing a valve-plate and also bearing a pressure-chamber having a flexible element as a part of it, means for moving

and carrier, means, as a passage, connecting said pressure-chamber with the pressure-supply, said pressure-chamber controlling the movements of said valve-plate laterally toward and from its seat as the pressure therein is controlled, and a spring acting to assist in moving said valve-plate toward its seat, substantially as described.

5. In a valve, a carrier bearing a valve-plate and also bearing a pressure-chamber having a flexible element as a part of it, means for moving said carrier, means, as a passage, connecting said pressure-chamber with the pressure-supply, said pressure-chamber controlling the movements of said valve-plate laterally toward and from its seat as the pressure therein is controlled, a spring acting to assist in moving said valve-plate toward its seat and a valve for controlling the pressure in said pressure-chamber, substantially as described.

6. In a valve, a carrier bearing a valve-plate and also bearing a pressure-chamber having a flexible element as a part of it, means for moving said carrier, means, as a passage connecting said pressure-chamber with the pressure-supply including as a part of it a passage in the stem attached to said carrier, said pressure-chamber controlling the movements of said valve-plate laterally toward and from its seat as the pressure therein is controlled, and a valve for controlling the pressure in said chamber, substantially as described.

7. In a valve, a carrier bearing a valve-plate and also bearing a pressure-chamber having a flexible element as a part of it, means for moving said carrier, means, as a passage, connecting said pressure-chamber with the pressure-supply, an outlet-passage leading from said pressure-chamber through which the pressure is released, said pressure-chamber controlling the movements of said valve-plate laterally toward and from its seat as the pressure therein is controlled, and a valve for controlling said outlet-passage, substantially as described.

8. In a valve, a carrier bearing a valve-plate and also bearing a pressure-chamber having a flexible element as a part of it, means for moving said carrier, means, as a passage, connecting said pressure-chamber with the pressure-supply, an outlet-passage leading from said pressure-chamber through which the pressure is released, said pressure-chamber controlling the movements of said valve-plate laterally toward and from its seat as the pressure therein is controlled, and a valve for controlling said outlet-passage operated by means employed for moving the carrier, substantially as described.

9. In a valve, a carrier bearing a valve-plate and also bearing a pressure-chamber having a flexible element as a part of it, means for moving said carrier, means, as a passage, connecting said pressure-chamber with the pressure-supply, an outlet-passage leading from said pressure-chamber through which the pressure is released including as a part of it a passage in a stem attached to said carrier, said pressure-chamber controlling the movements of said valve-plate laterally toward and from its seat as the pressure therein is controlled, and a valve for controlling said outlet-passage, substantially as described.

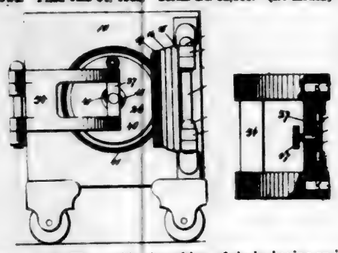
10. In a valve, a carrier bearing a valve-plate and also bearing a pressure-chamber having a flexible element as a part of it, a reinforcing-plate for said flexible element, means for moving said carrier, means, as a passage, connecting said pressure-chamber with the pressure-supply, said pressure-chamber controlling the movements of said valve-plate laterally toward and from its seat as the pressure therein is controlled, and a valve for controlling the pressure in said chamber, substantially as described.

11. In a valve, a carrier bearing a valve-plate and also bearing a pressure-chamber having a flexible element as a part of it, means for moving said carrier, means, as a passage, connecting said pressure-chamber with the pressure-supply, an outlet-passage leading from said pressure-chamber through which the pressure is released, said pressure-chamber controlling the movements of said valve-plate laterally toward and from its seat as the pressure therein is controlled, and a valve for controlling the pressure in said chamber constructed and arranged to close the passage leading from the pressure-supply to the pressure-chamber, and to open the outlet-passage leading from the pressure-chamber, substantially as described.

12 In a valve, a carrier bearing a valve-plate and also bearing a pressure-chamber having a flexible element as a part of it, means for moving said carrier, means, as a passage, connecting said pressure-chamber with the pressure-supply, an outlet-passage leading from said pressure-chamber through which the pressure is released, said pressure-chamber controlling the movements of said valve-plate laterally toward and from its seat as the pressure therein is controlled, and a valve operated by the means employed for moving the carrier for controlling the pressure in said pressure-chamber constructed and arranged to close the passage leading from the pressure-supply to the pressure-chamber, and to open the outlet-passage leading from said pressure-chamber, substantially as described.

13. In a valve, a carrier bearing a valve-plate and also bearing a pressure-chamber having a flexible element as a part of it, means for moving said carrier, means, as a passage, connecting said pressure-chamber with the pressure-supply, an outlet-passage leading from said pressure-chamber through which the pressure is released, said pressure-chamber controlling the movements of said valve-plate laterally toward and from its seat as the pressure therein is controlled, and a manually-operated valve for controlling the pressure in said chamber constructed and arranged to close the passage leading from the pressure-chamber and to open the outlet-passage leading from said pressure-chamber, substantially as described.

708,991. SCREW-DOOR SAFE. JOSEPH B. BOOE, Muscatine, Iowa. Filed Jan. 31, 1902. Serial No. 92,019. (No model.)



Claim.—1. The combination with a safe-body, having an inner and an outer door-opening, of a door for the outer door-opening, a door for the inner door-opening, supporting means for the inner door attached to the safe-body, and designed to project through the outer door-opening thereof, and means for automatically coupling the said supporting means to the inner door.

2. The combination with a safe-body, having an outer door-opening and also having an opening for an inner screw-door, of a screw-door for the outer door-opening, a screw-door for the inner opening, supporting means for the inner screw-door attached to the exterior of the safe-body, and designed to project through the outer door-opening thereof, and means for automatically coupling the said supporting means to the inner screw-door.

3. The combination with a safe-body, having an outer door-opening and also having an opening for an inner screw-door, of a screw-door for the inner opening, a door for the outer opening, a supporting-arm pivoted to the exterior of the safe and at one side of the outer opening, said arm being designed to swing in a horizontal plane and to be capable of projecting through the outer door-opening, and of engaging the front face of the inner door, and means for automatically coupling the said arm to the inner screw-door.

4. The combination with a safe-body, having an outer door-opening and also having an opening for the inner screw-door, of an outer door to fit in the outer door-opening, an inner screw-door comprising a body portion designed to enter the said opening for the inner door, a front plate for the inner door so arranged that the body portion of the door may rotate relative to the front plate thereof, a notched shank projecting forwardly from the front plate, an arm pivoted to the exterior of the safe capable of projecting through the opening for the outer door, an opening in its end to receive the said shank, and means for detaching the arm from the shank, for the purposes stated.

5. The combination with a safe-body, having an outer door-opening and also an opening for an inner screw-door, of an outer door, an inner screw-door comprising a body portion to enter the opening for the inner door, a front plate for the inner door attached to the body portion thereof in such manner as to permit the body portion to rotate relative to the front plate, a notched shank projecting forwardly from said plate, an arm pivoted to the body portion of the safe to swing in a horizontal plane, having its free end curved inwardly and designed to project through the outer opening, and having an opening in its end to receive the shank, spring-actuated bolts mounted in the arm to automatically enter the notch in the shank, a shaft mounted near the free end of the arm, having a knob at one end, a disk on the other end of the shaft having cam-grooves therein, and projections on the bolts admitted into said cam-grooves, whereby upon a manipulation of the knob, the bolts may be withdrawn from the notch in the shank, substantially as and for the purposes stated.

708,992. REFRIGERATOR. NICOLAS BESBARIS, Chicago, Ill., assignor of one-half to Edward S. Slocum, Chicago, Ill. Filed Nov. 23, 1901. Serial No. 83,977. (No model.)

Claim.—1. A refrigerator, comprising outer inclosing walls; an interior provision-chamber having its walls spaced from the outer inclosing walls; an ice-chamber within the inclosing walls above the provision-chamber, having its drainage into the interspace; a pipe leading from the bottom of the interspace opening therein to receive the filtered water, and extending upward in the lateral interspace; a water-chamber into which such pipe discharges; and a controlled discharge for such water-chamber.

2. A refrigerator comprising outer inclosing walls; an interior provision-chamber having its walls spaced from the outer inclosing walls; an ice-chamber within the inclosing walls above the provision-chamber, having its drainage into the interspace, said interspace being occupied with filtering material; a pipe leading from the bottom of the interspace embedded in said filtering material, and opening therein to receive the filtered water, and extending upward in the lateral interspace; a water-chamber into which such pipe discharges; and a controlled discharge for such water-chamber.

3. A refrigerator, comprising an outer inclosing wall; an interior provision-chamber having its walls spaced from the outer inclosing wall; filtering material occupying the interspace between the walls, and covering the interior chamber, said outer wall being extended upward above the provision-chamber to form a chamber for ice to be lodged upon the top of the filtering material, whereby the water of liquefaction from the ice filters downward about the provision-chamber; and a suitable discharge for the water of liquefaction at an elevated point; whereby the filtering material is saturated with the water.

4. A refrigerator comprising an outer inclosing wall; a metallic lining interior to such wall spaced therefrom; a plaster coating occupying the interspace between the outer wall and the metallic lining; an interior chamber having its walls spaced from the metallic lining; filtering material occupying the interspace, an ice-receptacle above the provision-chamber within the metallic lining, having its drainage into the interspace between the metallic lining and the provision-chamber; and means for permitting the discharge of the water of liquefaction from the upper part of the interspace, whereby the filtering material in such space may be kept saturated with the water of liquefaction.

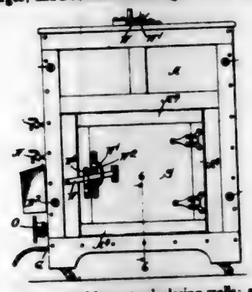
5. A refrigerator, comprising outer inclosing walls, an interior provision-chamber having its walls spaced from the outer inclosing walls, an ice-chamber within the inclosing walls above the provision-chamber, means for forming air communication between the ice and provision chambers, the ice-chamber having its drainage into the interspace, a pipe leading from the bottom of the interspace opening therein to receive the filtered water, and extending upward in the lateral interspace, a water-chamber into which such pipe discharges, and a controlled discharge for said water-chamber.

6. A refrigerator, comprising outer inclosing walls, an interior plaster coating for said walls, and a metal casing or lining adjacent to the plaster coating, an interior provision-chamber having its walls spaced from the outer inclosing walls, an ice-chamber within the inclosing walls above the provision-chamber, the ice-chamber having its drainage into the interspace, a pipe leading from the bottom of the interspace opening therein to receive the filtered water, and extending upward in the lateral interspace, a water-chamber into which such pipe discharges, and a controlled discharge for said water-chamber.

7. A refrigerator, comprising outer inclosing walls having an interior plaster coating, a metal lining adjacent to said coating, an interior provision-chamber having its walls spaced from said outer walls, a filtering material arranged in said interspace, an ice-chamber within the inclosing walls above the provision-chamber, air-tight-fitting doors or covers for the ice and provision chambers, the said ice-chamber having its drainage into the interspace, a pipe leading from the bottom of the interspace opening therein to receive the filtered water, and extending upward in the lateral interspace, a water-chamber into which such pipe discharges, a controlled discharge for said water-chamber, and a flushing-pipe for cleaning the filtering material when desired.

708,993. RECORDER FOR SIGNALS AND ENGINE-DRIVERS. JACQUES P. DE BRAAL, Paris, France. Filed Apr. 21, 1902. Serial No. 103,966. (No model.)

extending upward in the lateral interspace, a water-chamber into which such pipe discharges; and a controlled discharge for such water-chamber.



2. A refrigerator comprising outer inclosing walls; an interior provision-chamber having its walls spaced from the outer inclosing walls; an ice-chamber within the inclosing walls above the provision-chamber, having its drainage into the interspace, said interspace being occupied with filtering material; a pipe leading from the bottom of the interspace embedded in said filtering material, and opening therein to receive the filtered water, and extending upward in the lateral interspace; a water-chamber into which such pipe discharges; and a controlled discharge for such water-chamber.

3. A refrigerator, comprising an outer inclosing wall; an interior provision-chamber having its walls spaced from the outer inclosing wall; filtering material occupying the interspace between the walls, and covering the interior chamber, said outer wall being extended upward above the provision-chamber to form a chamber for ice to be lodged upon the top of the filtering material, whereby the water of liquefaction from the ice filters downward about the provision-chamber; and a suitable discharge for the water of liquefaction at an elevated point; whereby the filtering material is saturated with the water.

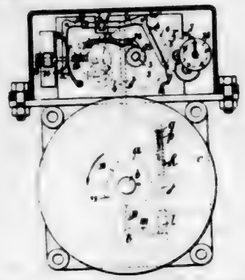
4. A refrigerator comprising an outer inclosing wall; a metallic lining interior to such wall spaced therefrom; a plaster coating occupying the interspace between the outer wall and the metallic lining; an interior chamber having its walls spaced from the metallic lining; filtering material occupying the interspace, an ice-receptacle above the provision-chamber within the metallic lining, having its drainage into the interspace between the metallic lining and the provision-chamber; and means for permitting the discharge of the water of liquefaction from the upper part of the interspace, whereby the filtering material in such space may be kept saturated with the water of liquefaction.

5. A refrigerator, comprising outer inclosing walls, an interior provision-chamber having its walls spaced from the outer inclosing walls, an ice-chamber within the inclosing walls above the provision-chamber, means for forming air communication between the ice and provision chambers, the ice-chamber having its drainage into the interspace, a pipe leading from the bottom of the interspace opening therein to receive the filtered water, and extending upward in the lateral interspace, a water-chamber into which such pipe discharges, and a controlled discharge for said water-chamber.

6. A refrigerator, comprising outer inclosing walls, an interior plaster coating for said walls, and a metal casing or lining adjacent to the plaster coating, an interior provision-chamber having its walls spaced from the outer inclosing walls, an ice-chamber within the inclosing walls above the provision-chamber, the ice-chamber having its drainage into the interspace, a pipe leading from the bottom of the interspace opening therein to receive the filtered water, and extending upward in the lateral interspace, a water-chamber into which such pipe discharges, and a controlled discharge for said water-chamber.

7. A refrigerator, comprising outer inclosing walls having an interior plaster coating, a metal lining adjacent to said coating, an interior provision-chamber having its walls spaced from said outer walls, a filtering material arranged in said interspace, an ice-chamber within the inclosing walls above the provision-chamber, air-tight-fitting doors or covers for the ice and provision chambers, the said ice-chamber having its drainage into the interspace, a pipe leading from the bottom of the interspace opening therein to receive the filtered water, and extending upward in the lateral interspace, a water-chamber into which such pipe discharges, a controlled discharge for said water-chamber, and a flushing-pipe for cleaning the filtering material when desired.

Claim.—1. In combination with a moving vehicle, a record-cylinder, a motor for rotating the same, means for holding the cylinder normally against rotation, a marker adapted to contact with said cylinder, means carried by the vehicle for simultaneously releasing said holding means and lowering the marker, and means for imparting an endwise movement to said cylinder while it is rotating, substantially as described.

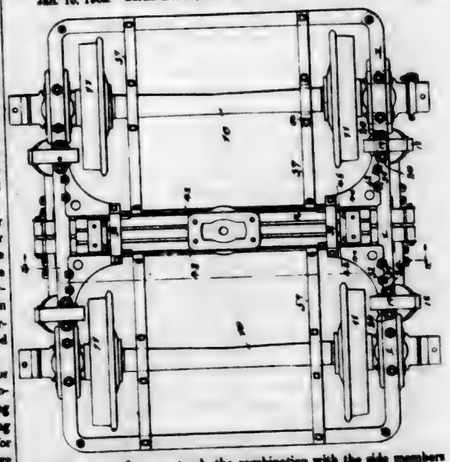


2. In combination with a moving vehicle, a record-cylinder, a motor for rotating the same, means for imparting to said cylinder an endwise movement when rotating, a pivoted spring-pressed plate carrying a marker adapted to make contact with said cylinder, a rod normally holding said plate out of contact with the cylinder, means for depressing said rod, and means controlling the movement of the motor, substantially as described.

3. In combination with a vehicle, a cylinder, a motor for rotating the same, a spring-pressed arm carrying a pointer adapted to contact with said cylinder, a rod having its upper end beneath said plate, a spring for forcing said rod upwardly, a bell-crank lever having one arm engaging said rod, and a rotatable cam adapted to operate against the other arm, substantially as described.

4. In combination with a moving vehicle, a record-cylinder, a shaft supporting the same, means for rotating said cylinder, a marker for said cylinder, a screw on one part of said cylinder, a stationary rack engaging said screw, and means for controlling both the operation of the marker and movement of the cylinder, substantially as described.

708,994. CAR-TRUCK. JOHN A. BRILL, Philadelphia, Pa. Filed Jan. 10, 1902. Serial No. 89,102. (No model.)



Claim.—1. In a car-truck, the combination with the side members of the truck-frame, and the axle-pedestals; of a top chord included by said side members, and a reinforcing-bar extending between said pedestals, upon which said chord rests.

2. In a car-truck, the combination with the top chord, and the pedestals, of a bar set on edge and extending between said pedestals parallel to said top chord, adapted to reinforce said top chord between the pedestals.

3. In a truck, the combination with the pedestals, a top chord having sections extending between the pedestals, separate bars supported

below and closely adjacent the said top-chord sections and secured at their ends to the pedestals, links suspended from the top chord in line with the said bars, and a bolster supported by said links, substantially as described.

4. In a car-truck, the combination with the flat side members of the top chord, the axle-box pedestals, and a bar set on edge secured to the pedestals, and abutting against the under side of the top-chord side members, substantially as described.

5. In a car-truck, the combination with the top chord and the pedestals, provided with recessed lugs projecting laterally therefrom; of a reinforcing-bar seated in said recesses and extending between said pedestals immediately beneath said top chord.

6. In a car-truck, the combination with the top chord, and the pedestals having laterally-projecting recessed lugs: of a reinforcing-bar set on edge and having its ends resting in said recesses in said pedestals, said bar abutting against and reinforcing said top chord between said pedestals.

7. The combination with the truck having a top chord and an underlying bar, brackets secured to the chord and bar, and transoms extending between the inner members of said brackets, substantially as described.

8. The combination in a car-truck, of the top chord 1, the pedestals having the top grooves 30 receiving the top chord, the lugs 32 on the pedestals extending inwardly and having the grooves 34 in line with the top chord, and the bar 29 with its ends inserted in the groove 34 and abutting against the top chord, substantially as described.

9. The combination in a car-truck, of the top chord, the recessed pedestals, a bar inserted in said recesses and extending below the top chord, brackets having longitudinal and transverse webs secured to the said bar and top chord intermediate of the pedestals, and transoms secured to and extending between the transverse webs, substantially as described.

10. In a car-truck, the combination with a top chord, the bar 29, of the brackets 37, having inwardly-stepped recesses 47, 48, receiving the top chord and bar, substantially as described.

11. The combination with the top chord, the bar 29 of less lateral dimension than the top chord, and the brackets 37 having stepped recesses 47, 48, and ledges 49, 50, and a vertical longitudinally-disposed web 39 in which said ledges and recesses are formed and which receives the edge of the top chord and face of the bar 29, and bolts passing through the bar and vertical web of the bracket, and the top chord, substantially as described.

12. As an article of manufacture, the axle-box pedestal having upright jaws, a top cross-bar having a longitudinal groove such as 30, a lug, and a recess formed in said lug in line with the said cross-bar groove, substantially as and for the purposes described.

13. As an article of manufacture, the axle-box pedestals comprising the upright jaws, the top crush-bar having ends extending beyond the jaws, lugs formed at the angle of the top cross-bar and jaws and extending outwardly from the jaws in the same plane as the top cross-bar, and recesses formed in said lugs opening outwardly at the ends thereof, as and for the purposes described.

14. As an article of manufacture, the transom brackets comprising the transverse and longitudinal vertical webs connected at their upper edges, and stepped recesses and ledges formed on the outer face of the longitudinal vertical web, as and for the purposes described.

15. In a car-truck, the combination with the side members of the truck-frame, the transom-bars, and brackets adapted to reinforce said side members and transoms, said brackets having flanged portions adapted to embrace the side members of said truck, and said transoms.

16. In a car-truck, the combination with the side members of the truck-frame, the transom-bars, and brackets having transverse and longitudinal vertical webs, the longitudinal web having stepped recesses receiving the said side members, the transverse web receiving the transoms.

17. In a car-truck, the combination with the side members of the truck-frame, of the transom bars, and brackets having transverse and longitudinal vertical webs, the longitudinal web having vertical recesses and receiving the said side members, bolts extending from the said side members through the vertical recesses of the bracket, the said transverse webs and transoms being connected.

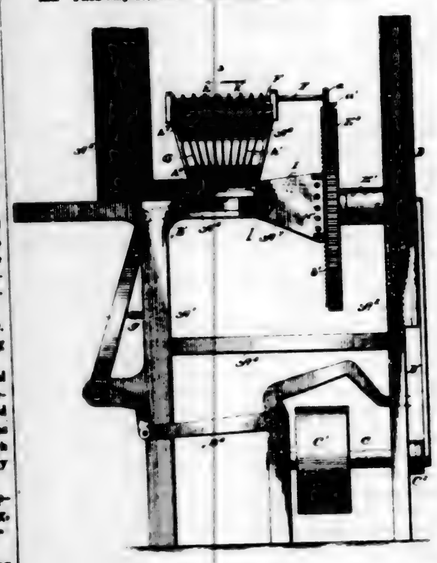
18. In a car-truck, the combination with the side frame, and transom-bars comprising a flat bar with its narrower edge disposed vertically, the side bar being deepened to substantially correspond with the height of the transom-bar, and the bracket having a longitudinal and transverse vertically-disposed web secured to the transom-bar and to the deepened portion of the side frame.

19. In a car-truck having side bars, the combination with the transoms, the interposed angular brackets having transverse vertical webs to which the transoms are secured and a longitudinal vertical web having a recess in which the side bars are secured.

20. As an article of manufacture, the bracket having a pair of angularly-disposed webs, one of said webs having stepped recesses in its side, flanges extending laterally from said webs, and horizontally-disposed webs connecting said vertical webs.

21. As an article of manufacture, the bracket having angularly-disposed vertical webs, upper and lower laterally-disposed flanges carried by said vertical webs, forming longitudinally-disposed recesses upon the sides of the bracket, and vertically-disposed recesses formed in one side of the bracket, said recesses running through said vertical web and the upper and lower flanges thereof.

708,995. **DRILLING-MACHINE.** WILLIAM R. BUTLER, Bedford Ind. Filed July 29, 1901. Serial No. 69,415. (No model.)



Claim.—1. In a drilling-machine, the combination of a suitable frame, and a rotatably (reversible) extensible two-part drill, comprising a spindle, through which power is applied, and a bit portion having threaded connection with the frame.

2. In a drilling-machine, the combination of a suitable frame, a series of parallel shafts, a series of rows of drills operated through said shafts, and means for imparting to the drill-bits reciprocating longitudinal movement.

3. In a drilling-machine, the combination of a suitable frame, a series of parallel shafts, means for imparting oscillating rotary movement to said shafts, and a series of rows of two-part drills operated through said shafts and comprising spindles geared to said shafts and bit portions operated by said spindles and having reciprocating longitudinal movement.

4. In a drilling-machine, the combination of a suitable frame, a series of parallel shafts, means for imparting oscillating rotary movement to said shafts, and a series of rows of two-part drills operated through said shafts and comprising spindles geared to said shafts and bit portions having sliding connection with said spindles and threaded connection with said frame.

5. In a drilling-machine, the combination of a suitable frame, a series of parallel shafts, a master-gear having gear connection with said shafts, a reciprocating rack serving to operate said master-gear, a series of rows of extensible drills operated through said parallel shafts, and means for feeding stock beneath said drills.

6. In a drilling-machine, the combination of a suitable frame, a reciprocating feed-slide, a driving-shaft, a reciprocating rack, said rack and feed-slide being operated through said shaft, a master-gear actuated by said rack, a series of shafts actuated from said master-gear, and extensible drills actuated from said last-named shafts.

7. In a drilling-machine, the combination of a suitable frame, a series of parallel shafts arranged on the surface of a portion of a cylinder, a master-gear, gear connections between said master-gear and said shafts, a series of rows of extensible drills operated from said shafts, a reciprocating feed-slide, a reciprocating rack, a lever connected with said feed-slide and having an end projecting into the path of said rack, and means for reciprocating said rack.

8. In a drilling-machine, the combination of a suitable frame, a series of parallel shafts, a series of rows of drills actuated from said shafts and lying in convergent planes, the individuals of each row being convergent, and means for operating said shafts.

9. In a drilling-machine, the combination of a suitable frame, a series of parallel shafts, extensible drills operated by said shafts, a master-gear operating said shafts, and a plurality of drills disposed substantially at right angles to said first-named group of drills and operated from said master-gear, said first-named group of drills operating to drill a side of a block and said second-named group of drills operating to drill an end of a block.

10. In a drilling-machine, the combination of a suitable frame, a guide, a reciprocating feed-slide connected with said guide, a plurality of drills arranged above said guide and operating to drill a side of a block, and a plurality of drills disposed substantially at right angles to said first-named group of drills and operating to drill an end of a block.

11. In a drilling-machine, the combination of a suitable frame, a reciprocating slide, a plurality of drills located above the path of said slide, a plurality of drills located at the rear end of the traverse of said slide, a master-gear, a plurality of shafts perpendicular to said master-gear and serving to operate said first-named drills, said shafts having gear connection to the periphery of said master-gear, and a shaft parallel to said master-gear and serving to operate said last-named group of drills, said last-named shaft having gear connection with a lateral peripheral margin of said master-gear

---

708,996. **STEAM-TRAP.** JAMES CAMPBELL, Port Blakely, Wash. Filed Oct. 25, 1901. Serial No. 79,501. (No model.)

Claim.—1. In a steam-trap, the combination of a movable chamber, locking devices for holding the chamber in discharging position comprising two normally disengaged members which are brought into engagement by the movement of the chamber, one of which members moves with the chamber and the other of which is supported independently of the chamber, and a device actuated by the emptying of the chamber for releasing the locking devices.

2. In a steam-trap, the combination of a pivotally-mounted chamber, a discharge-valve actuated by the movement of the chamber, locking devices for holding the chamber in position when said valve is open, comprising two normally disengaged members which are brought into engagement by the movement of the chamber, one of which members is mounted upon and moves with the chamber and the other of which is supported independently of the chamber, and a device actuated by the emptying of the chamber for releasing the locking devices.

3. In a steam-trap the combination of a movable chamber and retaining device for holding it in discharging position, comprising a plunger, a cup to receive the same and a valve actuated by the plunger to admit air between the plunger and the cup, substantially as shown and described.

4. In a retaining device for steam-traps the combination of an adjustable plate, a cup secured thereto, a plunger movable by the operation of the trap relatively to the cup and a relief-valve actuated by such movement to admit air between the plunger and the cup, substantially as shown and described.

708,997. **TIRE FOR VEHICLE-WHEELS.** MADISON C. CARTER, Bourne, Tex. Filed May 12, 1902. Serial No. 106,991. (No model.)

Claim.—1. In a wheel, the combination with felly-sections, of tubular tire-sections receiving the felly-sections and detachably connected at their ends, substantially as and for the purpose described.

2. In a wheel, the combination with felly-sections, of the tubular tire-sections surrounding and reinforcing the felly-sections and provided with projecting overlapping tongues, and fastening devices passing through the tongues and through the adjacent sections, substantially as described.

3. In a wheel, the combination with felly-sections, of the tubular tire-sections surrounding the felly-sections and forming a continuous tread and provided at the inner faces of the felly-sections with openings, substantially as described.

4. In a wheel, the combination with round felly-sections, of the tubular tire-sections provided at their inner sides with longitudinal openings and having recesses at one end and provided with projecting tongues located at the other end and fitting in the said recesses, and fastening devices passing through the tongues and through the adjacent sections, substantially as described.

708,998. **CATTLE-GUARD FOR RAILWAY-TRACKS.** HIRAM L. CHURCH, Chicago, Ill. Filed Sept. 7, 1901. Serial No. 74,596. (No model.)

Claim.—1. A cattle-guard for railway-tracks, comprising tread-rails; suspended and oscillating transverse supports for such tread-rails; and means for retaining the said rails loosely on such supports.

2. A cattle-guard comprising tread-rails having their lower edges downwardly convex in cross-section; transverse supports for such rails, on which their convex edges rest and are adapted to rock laterally; and means for retaining the tread-rails loosely on said supports, with lateral freedom for their rocking movement.

3. A cattle-guard comprising tread-rails having their lower edges downwardly convex; suspended and transverse oscillating supports for such rails, and means for retaining said rails loosely on their oscillating supports, with freedom for oscillating movement of the supports and lateral rocking movement of said rails.

4. A cattle-guard comprising tread-rails having their lower edges downwardly convex, whereby they are adapted to rock laterally on their supports; supports extending transversely under the convex edges of such tread-rails; and counterpoises depending rigidly from the tread-rails respectively, below the surface of the supports on which the said rails rock.

5. A cattle-guard comprising, in combination with the track-rails, brackets rigid with the rails adjacent thereto; sway-bars suspended from the upper ends of said brackets, extending transversely of the track between the rails, and tread-rails extending parallel with the track-rails, lodged on the sway-bars and loosely connected thereto, to permit said bars to swing laterally, giving the tread-rails longitudinal movement.

6. A cattle-guard for railway-tracks, comprising brackets rigid with the track-rails; sway-bars pivoted on such brackets and extending transversely with respect to the track-rails; tread-rails lodged on the sway-bars, having their lower edges downwardly convex, whereby they are adapted to rock laterally on said bars; and means connecting them loosely to the bars to permit such rocking movement of the tread-rails and oscillating movement of the sway-bars.

7. A cattle-guard for a railway-track, comprising two sway-bars pivotally supported near the level of the tread of the track-rail, depending therefrom, and extending parallel with each other transversely of the track; tread-rails lodged upon said transversely-extending sway-bars, alternate tread-rails having loose connections with one of the sway-bars, and the remaining alternate rails having like loose connections with the other sway-bars; whereby alternate tread-rails are adapted to be moved longitudinally in opposite directions.

8. A cattle-guard for railway-track comprising parallel sway-bars suspended so as to extend transversely of the track and to oscillate longitudinally thereof; tread-rails lodged on said sway-bars, alternate groups of such tread-rails being loosely connected to one sway-bar and the remaining alternate groups being loosely connected to the other sway-bar.

9. A cattle-guard for a railway-track, comprising upstanding brackets inside the track-rails respectively; links suspended from the upper ends of the said brackets and depending between the brackets; bars pivotally connected to the lower ends of said links, and extending across the track from link to opposite link; said transverse bars being shorter than the distance between the pivotal supports of the upper ends of the links, whereby the links are caused to trend away from their supporting-brackets respectively, affording room for lateral oscillation of the links, and longitudinal reciprocation of the transverse bars supported thereby, in addition to the lateral swinging movement of said bars.

10. A cattle-guard for a railway-track, comprising tread-rails and suspended and oscillating transverse supporting-bars for such tread-rails; brackets having feet or bases adapted to be secured to consecutive ties, and a connecting-bar extending parallel with the track-rail from side to side; links suspended from such connecting-bars, and at their lower ends carrying the said tread-rail-supporting bars; the said tread-rails lodged upon such supporting-bars being adapted to roll thereon and provided with counterpoises which swing in the interval between the ties.

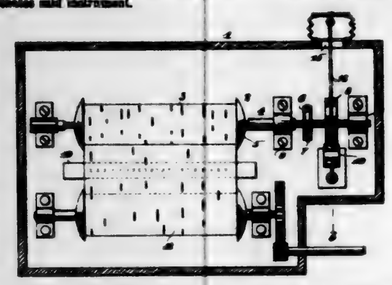
11. A cattle-guard for a railway-track, comprising tread-rails and suspended, oscillating transverse supporting-bars for said rails, and brackets from which such bars are suspended lodged on the base-flanges of the track-rails.

12. A cattle-guard for a railway-track, comprising tread-rails and suspended and oscillating transverse supporting-bars for said rails, and brackets from which such bars are suspended, having the point at which the suspension is made overhung by the cap or tread of the rail.

13. A cattle-guard for a railway-track, comprising tread-rails and suspended, oscillating transverse supporting-bars for said rails, brackets from which such bars are suspended mounted between the track-rails, and links by which the bars are suspended from the upper part of the brackets, the latter being cut away between their supports at the lower part under the point of suspension of the links, permitting the latter to swing in between the supports.

708,999. ROLL MECHANISM. CHARLES H. DAVIS, New York, N. Y. Filed Sept. 9, 1901. Serial No. 74,738. (No model.)

Claim.—1. In a music-roll mechanism, for pneumatically-actuated musical instruments, the combination with the music-roll of a brake-wheel driven by said music-roll, a brake-shoe, adapted to engage said brake-wheel and a pneumatic actuating said brake-shoe by the pneumatic pressure which actuates said instrument.



2. In a music-roll mechanism for pneumatically-actuated musical instruments, the combination with the music-roll, of a brake-wheel connected with said music-roll, and means for automatically applying frictional resistance to the revolution of said brake-wheel during the playing of the instrument.

3. In a music-roll mechanism for pneumatically-actuated musical instruments, the combination with the music-roll, of a brake-wheel connected with said music-roll, and means whereby frictional resistance is automatically applied to said brake-wheel during the playing of said instrument and automatically relieved therefrom during the rewinding of the music-roll.

709,000. SASH-CORD PULLEY. PETER DOSSE, Yonkers, N. Y. Filed May 14, 1902. Serial No. 107,242. (No model.)

Claim.—1. The combination in a sash-pulley of a face-plate having an upper and lower tongue cut from the face-plate itself, provided with means for supporting the wheel-frame and a hole made in one of the tongues for the insertion of a tool whereby a portion of the structure may be forced into the wood of the window-frame.

2. The combination in a sash-pulley of a face-plate having a tongue cut therefrom and arranged at substantially right angles thereto, a portion of the tongue being slit so as to afford a part adapted to be forced into the wood of the frame for the confinement of the pulley.

3. The combination in a sash-pulley of a face-plate having a tongue cut therefrom and arranged at substantially right angles thereto, an inclined recess at or near the junction between the tongue and the face-plate whereby the sides of the wheel-supporting frame will be thrown outwardly or bell-mouthed, for the purpose set forth.

4. The face-plate of a pulley having one end bent downwardly at an angle adapted to enter a similarly-shaped recess in the wood of the frame and a part of the metal constituting the face-place adapted to be forced into the wood of the frame after the pulley is set.

5. In a sash-pulley the combination of a wheel-supporting frame embodying side bars, each made of angular form, whereby their ends are adapted to engage with and be supported by devices attached to the face-plate and located adjacent to the face-plate, said side bars having a projecting central part adapted to properly support the pulley-wheel.

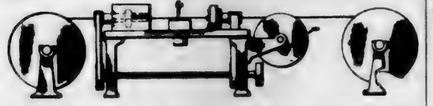
6. In a sash-pulley the combination of a wheel-supporting frame embodying two side bars, the edges whereof are reinforced by flanges or ribs and the ends whereof are adapted to engage with tongues cut from the face-plate and arranged at substantially right angles thereto and said tongues themselves.

7. In a sash-pulley the combination of a wheel-supporting frame embodying side bars having a hub-shaped recess formed at or near their central portion adapted to receive a similarly-shaped hub formed on the wheel, and flanges or ribs formed on the edges of the said side frames whereby they are stiffened.

8. In a sash-pulley the combination of a wheel made in two parts fastened together and having a hub at its central portion and a wheel-supporting frame embodying two lateral bars having a hub-shaped recess formed at or near their central part and integral therewith adapted to receive the hub of the wheel and a rivet connecting the two side bars together through an opening in the hub of the wheel.

709,001. PROCESS OF MANUFACTURING ELECTRICAL CONDUCTORS. LOUIS W. DOWNES, Providence, R. I. Filed Feb. 17, 1902. Serial No. 94,181. (No specimens.)

Claim.—1. The herein-described process of producing insulated electrical conductors consisting in covering the conductor with a suitable insulating material and subjecting the insulation to pressure alternately applied and released, thereby compacting the insulation on the conductor.



2. The herein-described process of producing insulated electrical conductors consisting in covering the conductor with a suitable insulating material and subjecting the insulation to pressure alternately applied and released in rapid succession, thereby compacting the insulation on the conductor.

3. The herein-described process of producing insulated electrical conductors consisting in covering the conductor with a suitable insulating material and subjecting the insulation to pressure alternately applied and released in rapid succession, the application of the pressure being equally distributed over the entire surface of the insulation, thereby uniformly compacting the insulation on the conductor.

4. The process of producing electrical conductors consisting in covering a conductor with a suitable insulating material, and subjecting the covered conductor to a rapid succession of blows uniformly distributed over its surface.

5. The process of producing electrical conductors consisting in covering a conductor with a suitable insulating material, and swaging the covered conductor thereby compacting the insulation.

6. The process of producing insulated electrical conductors consisting in applying an adhesive substance to a conductor, covering the conductor with a suitable insulating material, and subjecting the covered conductor to pressure alternately applied and released in rapid succession, thereby compacting the insulation on the conductor.

7. The process of producing insulated electrical conductors consisting in applying an adhesive substance to a conductor, covering the conductor with a suitable insulating material, heating the covered conductor to a temperature sufficient to melt the adhesive substance and subjecting the covered conductor to pressure alternately applied and released in rapid succession thereby compacting the insulation on the conductor.

8. The process of producing insulated electrical conductors consisting in applying an adhesive substance to a conductor, covering the conductor with a suitable insulating material, capping the insulating-covering to remove irregularities and lay the nap all in one direction and subjecting the covered conductor to pressure alternately applied and released in rapid succession thereby compacting the insulation on the conductor.

9. The process of producing insulated electrical conductors consisting in covering the conductor with a suitable insulating material, moistening the insulation and subjecting the covered conductor to pressure alternately applied and released in rapid succession, thereby compacting the insulation on the conductor.

10. The process of producing insulated electrical conductors consisting in applying an adhesive substance to a conductor, covering the conductor with a suitable insulating material, heating the covered conductor to a temperature sufficient to melt the adhesive substance, capping the insulating-covering to remove irregularities and lay the nap all in the same direction, moistening the insulating-covering and subjecting the covered conductor to pressure alternately applied and released in rapid succession thereby compacting the insulation on the conductor.

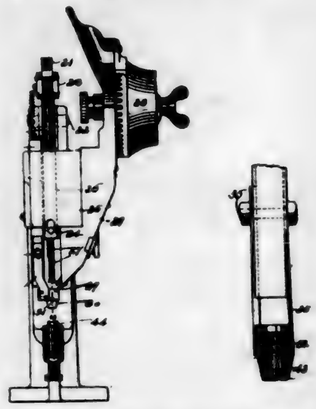
709,002. GUIDE-POCKET FOR RIVET SETTING MACHINES. ROBERT DRAPER, Waltham, Mass., assignor to Judson L. Thomson Manufacturing Company, Waltham, Mass., a Corporation of Maine. Filed Dec. 10, 1901. Serial No. 85,945. (No model.)

Claim.—1. A guide-pocket for rivet-setting machines comprising two rivet-guiding fingers, each of said fingers provided with a vertical rivet-guiding recess, one of said recesses being of larger area in cross-section than the other, and the two recesses forming together a cylindrical guide-passage.

2. A guide-pocket for rivet-setting machines comprising two rivet-guiding fingers, each of said fingers provided with a vertical rivet-guiding recess, the periphery of one of said recesses being greater than a semicircle and the periphery of the other recess being less than a semicircle, the two recesses forming together a cylindrical guide-passage.

3. A guide-pocket for rivet-setting machines comprising two rivet-guiding fingers, one of said fingers provided with a vertical rivet-guiding recess of sufficient area to receive more than one-half the head of one of said rivets, the other of said fingers provided with a vertical recess of an area in cross-section less than one-half the head of one of said rivets, the two recesses forming together a vertical cylindrical guide-passage.

4. A guide-pocket for rivet-setting machines comprising two rivet-guiding fingers, each of said fingers provided with a vertical rivet-guiding recess, one of said recesses being of larger area in cross-section than the other, the two recesses forming together a cylindrical guide-passage, one of said fingers rigidly supported upon said machine and the other finger spring-supported thereon.



5. A guide-pocket for rivet-setting machines comprising two rivet-guiding fingers, each of said fingers provided with a vertical rivet-guiding recess, the two recesses forming together a cylindrical guide-passage, and a lateral entrance-passage leading into one of said recesses.

6. A guide-pocket for rivet-setting machines comprising two rivet-guiding fingers, each of said fingers provided with a vertical rivet-guiding recess, the two recesses forming together a cylindrical guide-passage, and a lateral entrance-passage leading into one of said recesses, the bottom wall of said entrance-passage being beveled downwardly into said recess for the purpose specified.

7. A guide-pocket for a machine for setting rivets comprising two rivet-guiding fingers, one of said fingers provided with a recess of sufficient area in cross-section to receive more than one-half the head of one of said rivets, the other of said fingers provided with a recess of an area in cross-section less than one-half the head of one of said rivets and having a rivet-supporting ledge at the upper end in said recess.

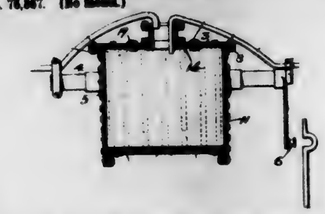
709,003. PROCESS OF PRODUCING SOLUBLE MILK-ALBUMEN. HENRY V. DUNHAM, New York, N. Y. Filed Oct. 23, 1901. Serial No. 80,247. (No specimens.)

Claim.—1. The herein-described process for producing soluble milk-albumen, consisting in reducing the whey containing the albumen and milk-sugar to the form of a heavy syrup, by evaporation at temperatures below the coagulating-point of the albumen, then separating the thickened or concentrated liquid from the crystallized milk-sugar therein, then precipitating the albumen from the concentrated liquid by the addition to such concentrated liquid of a small percentage of acid, and then removing the precipitated albumen from the concentrated liquid from which it has been precipitated.

2. The herein-described process for producing soluble milk-albumen from whey, said process consisting in neutralizing the acidity of the whey, then reducing the whey containing the albumen and milk-sugar to the form of a heavy syrup, by evaporation at temperatures below the coagulating-point of the albumen, then separating the thickened or concentrated liquid from the crystallized milk-sugar therein, then precipitating the albumen from the concentrated liquid by the addition to such concentrated liquid of a small percentage of hydrochloric acid, and then removing the precipitated albumen from the concentrated liquid from which it has been precipitated.

3. The herein-described process for producing soluble milk-albumen, consisting in reducing the whey containing the albumen and milk-sugar to the form of a heavy syrup by evaporation at temperatures below the coagulating-point of the albumen, then separating the thickened or concentrated liquid from the crystallized milk-sugar therein, then precipitating the albumen from the concentrated liquid by the addition to such concentrated liquid of a small percentage of acid, then removing the precipitated albumen from the concentrated liquid from which it has been precipitated, by straining, then removing the excess of acid from the albumen by washing the latter, and then finally drying the albumen to put it in its preferable commercial condition.

709,004. GENERATOR FOR CHLORIN GAS. THOMAS EDWARDS, Sebastopol, Ballarat, Victoria, Australia. Filed Sept. 28, 1901. Serial No. 76,867. (No model.)



Claim.—1. In combination, the casing, the cover having openings, a lead lining having washers extending around the edges of the openings, a dome over one of the openings seated upon the lead washer, and a clamped cover on the washer of the other opening, substantially as described.

2. In combination, the casing having a cover with an opening, a lead lining having integral rivets headed on the outside of the cover, and washers extending around the edge of the opening, substantially as described.

3. A generator for chlorin gas and the like of semicylindrical form having a flat top, journals near said flat top projecting laterally and upon which the generator may rock, a dome surmounting the said flat top, a gas-pipe leading therefrom and a covered opening in the flat top to one side of the dome, substantially as described.

709,005. CARD OR SHEET PLATEN FOR TYPE-WRITING MACHINES. ROBERT J. FISHER, Athens, Tenn., assignor to the Fisher Book Typewriter Company, Cleveland, Ohio, a Corporation of Delaware. Filed Apr. 30, 1901. Serial No. 58,182. (No model.)

Claim.—1. The combination with a flat platen and the main tracks or guides, of a work-holder disposed between said tracks or guides and coöperating with the platen to clamp the work thereon, said work-holder having guiding means for a card or sheet.

2. The combination with a flat platen and the main tracks or guides, of a work-holder disposed between the tracks or guides and comprising members coöperating with the platen to clamp the work thereon, said members having holding-guides to guide and hold a card or sheet.

3. The combination with a flat platen, of a work-holder comprising members coöperating with the platen to clamp the work thereon, said members having adjustable work-holding guides to guide and hold cards or sheets of different thicknesses.

4. The combination with a flat platen, of a work-holder comprising members coöperating with the platen to clamp the work thereon, said members having opposed self-adjusting holding-guides for the reception of a card or sheet to guide the same to the printing position.

5. The combination with a platen, of a work-holder comprising members coöperating with the platen to clamp the work thereon, said members having guiding means disposed out of the plane of the bottom of the members to guide a card or sheet to the printing position.

6. The combination with a platen, of a work-holder comprising members coöperating with the platen to clamp the work thereon, said members having work-holding guides disposed in a plane above the bottom of the members and designed to guide a card or sheet to the printing position and to retain it in such position during the printing operation.

7. The combination with a platen, of a work-holder comprising members coöperating with the platen to clamp the work thereon, each of said members being provided in a plane above its bottom with an open-ended longitudinal guideway for the reception of the edge of a card or sheet.

8. The combination with a flat platen and the tracks or guides, of a bodily-movable work-clamp coöperating with the platen between the tracks or guides to clamp the work thereon and formed with a guide along which a work-sheet may be guided to the printing position.

9. The combination with a platen, of a work-holder comprising members movable toward and away from the platen to clamp the work between said members and the writing-surface of the platen, the members of the work-holder being formed with guiding means disposed in opposed relation and designed to guide a card or sheet to the printing position.

10. The combination with a platen, of a work-holder comprising members movable toward and away from the platen and designed to clamp the work against the writing-surface thereof, said members being provided with open-ended guideways for the reception of the edges of a card or sheet.

11. The combination with a flat platen and the tracks or guides, of a work-holder disposed between the tracks or guides and comprising members movable toward and away from the platen and designed to clamp the work-sheet against the writing-surface thereof, said clamping members being relatively adjustable to accommodate work of different sizes.

12. The combination with a flat platen and the tracks or guides, of a work-holder disposed between the tracks or guides and comprising members coöperating with the platen to clamp the work thereon, said members being adjustable relatively to accommodate work of different sizes and having guiding means for a card or sheet.

13. The combination with a flat platen and the tracks or guides, of a work-holder disposed between the tracks or guides and comprising members movable toward the platen to clamp the work against the printing-surface thereof, said members having opposed guideways for the edges of the card or sheet, and one of said members being adjustable over the platen to accommodate work of various sizes.

14. The combination with a platen, of a work-holder comprising members movable toward the platen to clamp the work against the writing-surface thereof and having opposed open-ended guideways located at their inner edges for the reception of the edges of a card or sheet, one of said members being movable over the face of the platen to accommodate work of various sizes.

15. The combination with a flat platen and the tracks or guides, of a hinged work-holder coöperating with the platen between the tracks or guides to clamp the work and having guiding means for a card or sheet.

16. The combination with a flat platen and the tracks or guides, of a work-holder coöperating with the platen between the tracks or guides to clamp the work, and bodily movable to different positions over the platen to accommodate work of various sizes, said holder having holding and guiding means for a card or sheet.

17. The combination with a flat platen and the tracks or guides, of a work-holder disposed longitudinally of the platen between the tracks or guides and independently movable upon a longitudinal axis, said work-holder having holding and guiding means for a card or sheet.

18. The combination with a flat platen and the tracks or guides, of a work-holder disposed between the tracks or guides and comprising opposed members movable upon longitudinal axes, and means for retaining said members against movement.

19. The combination with a flat platen and the tracks or guides, of a work-holder disposed between the tracks or guides and comprising members movable upon longitudinal axes to clamp the work against the writing-surface of the platen, and means for retaining said members in their elevated and depressed positions.

20. The combination with a flat platen and the tracks or guides, of a work-holder disposed between the tracks or guides and comprising members movable upon longitudinal axes located at the outer longitudinal edges of the members, said members being designed to coöperate with the platen to clamp the work thereon and arranged parallel with the tracks or guides.

21. The combination with a platen, of a work-holder having a longitudinally-disposed member movable upon a longitudinal axis and coöperating with the platen to clamp the work thereon, said member having a guide located along its free edge to guide a card or sheet in its movement to the printing position.

22. The combination with a flat platen and the tracks or guides, of a work-holder comprising opposed members disposed longitudinally of the platen between the tracks or guides and hinged at their outer longitudinal edges, and opposed longitudinal guides at the opposed inner edges of the members for the reception of the edges of the card or sheet to guide the latter to the printing position.

23. The combination with a flat platen and the tracks or guides, of a work-holder located between the tracks or guides and comprising members disposed longitudinally of the platen and hinged at their outer longitudinal edges, and opposed longitudinal guides at the inner edges of the members for the reception of the edges of a card or sheet, said members being relatively adjustable to accommodate work of different sizes.

24. The combination with a flat platen and the tracks or guides, of a work-holder located between the tracks or guides and comprising members coöperating with the platen to clamp the work thereon and having guiding means for a card or sheet, one of said members being hinged for movement on a longitudinal axis.

25. In a type-writing machine, the combination with the platen and the main tracks or guides for the traveling printing mechanism, of a longitudinally-hinged work-holder disposed between the tracks or guides and coöperating with the platen to clamp the work thereon.

26. In a type-writing machine, the combination with the platen and the main tracks or guides for the traveling printing mechanism, of a work-holder disposed between the tracks or guides and comprising members independently hinged for movement on longitudinal axes and coöperating with the platen to clamp the work thereon.

27. The combination with the platen and the tracks or guides, of a work-gage and a work-holder coöperating therewith, said work-holder comprising a combined sheet-clamp and card-guide, coöperating with the platen to clamp the sheet thereon.

28. The combination with a platen, and a gage device carried by the platen and disposed to aline the work thereon, of a work-holder comprising a longitudinally-hinged member coöperating with the gage and platen to clamp the work in the printing position.

29. The combination with a platen and the main tracks or guides for the traveling printing mechanism, of a gage device carried by the platen to aline the work, and a work-holder mounted on the platen between the tracks or guides and comprising a hinged member coöperating with the work-gage and with the platen to clamp the work upon the writing-surface of the latter.

30. The combination with a platen and the main tracks or guides for the traveling printing mechanism, of a gage device carried by the platen and disposed to aline the work, and a work-holder comprising a member hinged independently of the tracks or guides and coöperating with the work-gage.

31. The combination with the platen and the main tracks or guides for the traveling printing mechanism, of a work-gage comprising an alined series of gage projections, and a work-holder comprising a member hinged independently of the tracks or guides for movement toward and away from the platen, said member being disposed for coöperation with the gage-pins to clamp a work-sheet in its proper printing position against the platen.

32. The combination with a platen and the main tracks or guides for the traveling printing mechanism, of a gage device comprising an alined series of gage-pins projecting above the surface of the platen, and a work-holder disposed between the tracks or guides and independently hinged for movement on a longitudinal axis, said member being apertured for the reception of the gage-pins and coöperating with the platen to clamp the work thereon.

33. The combination with a platen, and a gage device disposed to aline the work, of a work-holder comprising a hinged member coöperating with the gage device and platen and disposed to clamp the work against the writing-surface of the latter, said member being provided with guiding means for a card or sheet.

34. The combination with a platen having gage-pins, of a work-holder comprising a hinged member coöperating with the platen to clamp the work thereon and also coöperating with the gage-pins, said member being provided with a guide defined between an apertured base, and a yielding upper section formed with openings, said gage-pins being disposed to pass through the apertures in the base and the openings in the yielding section of the guide.

35. The combination with a platen, of a work-holder comprising a member coöperating with the platen to clamp the work thereon, and an adjustable carriage for the member, said carriage comprising slides disposed at opposite ends of the member and said member being movable with respect to the carriage.

36. The combination with a platen, of a work-holder comprising a member coöperating with the platen to clamp the work thereon, and an adjustable carriage for said member, said carriage comprising a pair of connected slides each having interfitting engagement with the opposite edges of the platen.

37. In combination with the platen, and a gage device, the work-holder coöperating with the gage device to aline and clamp the work upon the platen, said work-holder being composed of members having opposed guides for the edges of a card or sheet.

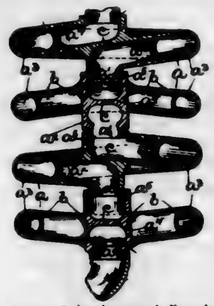
38. In combination with the platen, the combined card-guide and sheet-clamp composed of two members, each bodily movable toward and away from the platen to clamp or release the work and having opposed guides disposed to engage the edges of the work-sheet to guide the same to the printing position.

39. In combination with the flat platen and the tracks or guides, of the swinging card-guide and sheet-clamp mounted on the platen and coöperating therewith to clamp or release the work and having a guide disposed to engage the edge of the work-sheet to guide the same to the printing position.

40. In combination with the flat platen and the tracks or guides, the work-holder arranged over the platen and provided with guiding and holding means for the opposite edges of a card or sheet and bodily movable toward and away from the platen to clamp a sheet between its under surface and the platen.

41. In combination with the flat platen, the tracks or guides, and a gage device, of the combined card-guide and sheet-clamp coöperating with the gage to aline and hold the work.

709,006. STEAM-GENERATOR OR WATER-HEATER. BERNARD A. OSBURN, Cleveland, Ohio. Filed Apr. 7, 1902. Serial No. 101,734. (No model.)

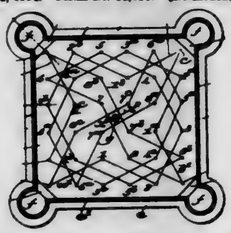


Claim.—1. A heater of the character indicated, comprising several sections arranged at different elevations respectively, and each section provided with an induction-port or fluid-inlet arranged at the bottom and centrally of the section and an upwardly-discharging eduction-port or fluid-outlet arranged at the top and centrally of the section, and each section, except the lowermost section, communicating, at its induction-port, with the eduction-port of the section next below, and each section also having the following: a lower sloping passage-way, an upper sloping passage-way and two intermediate sloping passage-ways, with the lower passage-way and the upper passage-way arranged at opposite sides, respectively of the ports of the said section, with the lower passage-way extending laterally outwardly and upwardly from the induction-port, with the upper passage-way arranged a suitable distance above the upper end of the lower passage-way and extending laterally outwardly and downwardly from the eduction-port, and with the two intermediate passage-ways arranged at opposite sides respectively of the lower and upper passage-ways and connecting the upper end of the lower passage-way with the lower end of the upper passage-way and gradually sloping upwardly from the lower passage-way.

2. A heater of the character indicated, comprising several sections arranged at different elevations respectively, and each section provided with an eduction-port and an induction-port arranged at the top and bottom respectively and centrally of the section, and each section, except the lowermost section, communicating, at its induction-port, with the eduction-port of the section next below, and adjacent sections having mutually-engaging threads at their communicating parts, and each section also having the following: a lower sloping passage-way, an upper sloping passage-way and two intermediate sloping passage-ways, with the lower passage-way and the upper passage-way arranged at opposite sides respectively of the ports of the said section, with the lower passage-way extending laterally outwardly and upwardly from the induction-port, with

the upper passage-way arranged a suitable distance above the upper end of the lower passage-way and extending laterally outwardly and downwardly from the ejection-port, and with the two intermediate passage-ways arranged at opposite sides respectively of the lower and upper passage-ways and connecting the upper end of the lower passage-way with the lower end of the upper passage-way and gradually sloping upwardly from the lower passage-way.

709,007. GAME APPARATUS. WILLIAM GIBB, Boston, Mass. Filed Dec. 21, 1901. Serial No. 86,730. (No model.)



Claim.—1. A game apparatus comprising a field having thirty-six putting-holes distributed thereover in six rows, six holes in each row connected by an endless course suitably indicated thereon requiring the ball or movable device to pass diagonally from any one of said holes to the right or to the left to another hole in said course, passing between two holes in one of the rows of holes made across or lengthwise of the field.

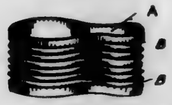
2. A game apparatus comprising a playing-field having thirty-six putting-holes distributed thereover in six rows, six holes in each row, said holes being suitably indicated to designate four courses, all connected as an endless course, the successive holes in each course following diagonally to the right or left to a hole in another parallel row of putting-holes.

3. A game apparatus having a playing-field provided with thirty-six putting-holes and united to produce an endless course connecting all of said putting-holes in the manner set forth, said endless course consisting of four similar paths united substantially as indicated.

4. A game apparatus having a playing-field provided with putting-holes distributed thereon and composed of separate paths arranged in an endless course, the separate paths being designated in suitable manner that they may be distinguished from the remaining paths making up the endless course.

5. A game apparatus having a playing-field provided with putting-holes distributed thereon and composed of separate paths arranged in an endless course, the separate paths being designated in suitable manner that they may be distinguished from the remaining paths making up the endless course, and bankers communicating with the playing-field.

709,008. KNIFE, CUTTER, OR DIEING-OUT INSTRUMENT. JULIAN H. GIBSON, JOSIAH GIBSON, ARTHUR J. GIBSON, and SYDNEY A. GIBSON, Leicester, England. Filed Dec. 9, 1901. Serial No. 85,294. (No model.)



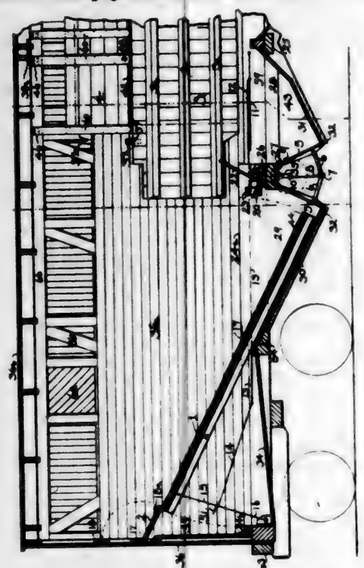
Claim.—A die, cutter, or dieing or cutting out instrument A having ribs, corrugations or indentations B on its outer walls, and its cutting edge in line with the interior walls thereof, substantially as described.

709,009. FREIGHT-CAR. HORACE S. GODFREY, Chicago, Ill. Filed Sept. 20, 1901. Serial No. 75,998. (No model.)

Claim.—1. In a car having a bottom formed in part of tilting sections, means for securing a tight joint between the outer edges of said sections and the sides of the car, said means consisting of yieldingly-supported plates secured along the said edges of said sections, substantially as set forth.

2. In a car having a bottom formed in part of tilting sections, means for securing a tight joint between the outer edges of said sections and the sides of the car, said means secured to the said sections and consisting of yieldingly-supported plates overlying the edges of said sections and abutting against the side walls of the car, substantially as set forth.

3. In a car having a bottom formed in part of tilting sections, means for securing a tight joint between the edges of the sections and the sides of the car, consisting of slidable plates spring-supported on the tilting sections and abutting against the inner walls of the car, as set forth.

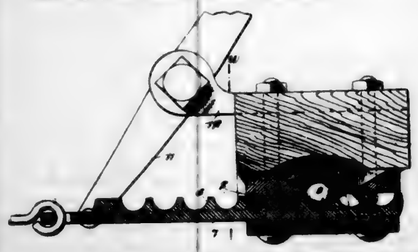


4. In a car having a bottom formed of movable sections, means for securing a tight joint between the edges of the sections and the walls of the car, consisting of angle-plates slidingly and yieldingly supported on the movable sections.

5. In a car having a fixed hopper, a bottom or floor formed of tilting sections adapted when moved to an inclined position to form hopper-bottoms extending from the hopper-doors to near the ends of the car, and of hinged sections adapted when in horizontal position to cover the fixed hopper, and when raised to form grain-doors, and means for effecting a tight joint between the edges of the tilting sections and the sides of the car, said means being secured to the edges of said tilting sections.

6. In a car, a floor composed of tilting sections and of hinged sections, means for effecting a grain-tight joint between the sides of the car and the edges of the tilting sections, and means for supporting the tilting sections in a horizontal position, said means being automatically operated by the lowering of the hinged sections, substantially as set forth.

709,010. LOCKING DEVICE. JOEL W. GOSER, Kinderhook, Ala. Filed July 3, 1901. Serial No. 66,994. (No model.)

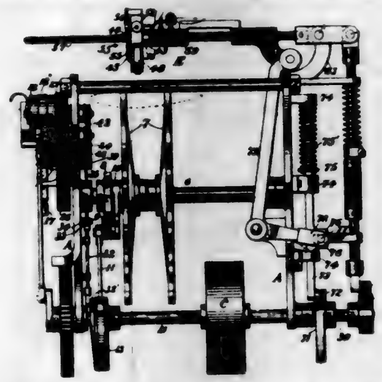


Claim.—1. In a locking device, a stationary member having an inclined runway, an abutment opposite the runway and having an inclined upper surface, the said stationary member also having an opening extending underneath said runway and abutment, there being a space between the runway and abutment, a locking-ball movable into the stationary member, and a rack member having concaved notches to receive the ball, substantially as specified.

2. In a locking device, a keeper having an inclined runway and an abutment spaced from and opposite the runway, a locking-ball movable into the keeper, and a rack member, the adjacent sides of teeth thereof being carved to engage closely against the ball, substantially as specified.

3. In a locking device, a fixed keeper having an inclined runway, a rack member movable in said keeper on a substantially horizontal plane, a ball in said fixed portion or member for engaging with the rack, and lifting device carried by the fixed portion for raising the ball onto the runway, substantially as specified.

709,011. MARKING-MACHINE. FERDINAND J. HAGEN, New York, N. Y. Filed Oct. 18, 1901. Serial No. 79,077. (No model.)



Claim.—1. In a marking-machine, a device for carrying or holding the objects to be marked, and means for imparting an intermittent progressive motion thereto, a marking-material-supply device, a slidable marking-head, and means for carrying the same to a position before first one of said devices and then the other, and means for moving said head toward and from each of said devices.

2. In a marking-machine, a device for carrying or holding the objects to be marked, and means for imparting an intermittent progressive motion thereto, a marking-material-supply device, a slidable marking-head, and means for moving the same horizontally to a position before first one of said devices and then the other, and means for oscillating said head transversely of its other movements to move the same toward and from each of said devices.

3. In a marking-machine, a device for carrying the objects to be marked, and means for imparting a rotary intermittent motion thereto, a marking-material-supply device, a slidable marking-head, and reciprocatory and oscillatory mechanisms whereby the said head is carried to a position before each of said devices and toward and from the same.

4. In a marking-machine, means for carrying the objects to be marked, means for supplying marking material, a marking-head, cam-actuated lever mechanism for reciprocating said head to a position before first one of said means and then the other, and similar mechanism for oscillating the head toward and away from each of said means.

5. In a marking-machine, the combination of a carrier for the objects to be marked, effective to be advanced step by step; means for so advancing the same; means for supplying marking material, located adjacent to the carrier; a marking-head; means for supporting the marking-head, traversing the supply means and carrier; means effective to move said supporting means toward and from said supply means and carrier; and means effective to reciprocate the head on such supporting means.

6. In a marking-machine, the combination of framework; a driving-shaft carried thereby; a carrier mounted on the framework and effective to be advanced step by step; means operated by the driving-shaft for so advancing the carrier; marking-material-supply means mounted adjacent thereto; a shaft pivoted above said supply device and said carrier; means operated by the driving-shaft for oscillating said shaft on its pivot; a printing-head mounted on said shaft; and means operated by the driving-shaft for reciprocating said head on said shaft.

7. In a marking-machine, the combination of a head comprising a marking-strip effective to wrap about an object to be marked; means to so wrap the same, operative partly by such strip; and means comprising a plunger, operative by the object and coöperative with said strip to operate the wrapping means; a shaft, and a hub thereon carrying the head and provided with a bore having flaring ends and effective to permit the same to rock upon said shaft.

8. In a marking-machine, the combination with a shaft; a head comprising a marking-strip effective to wrap about an object to be marked; means to so wrap the same, operative partly by such strip; means comprising a plunger, operative by the object and coöperative with said strip, to operate the wrapping means; and a hub carrying the head and provided with a bore having flaring ends effective to permit the same to rock upon said shaft.

9. In a marking-machine, the combination of a shaft; a head comprising a marking-strip effective to wrap about an object to be marked; means to so wrap the same, operative partly by such strip; means comprising a plunger operative by the object and coöperative with said strip to operate the wrapping means; a hub carrying said head upon said shaft, and effective to rock thereon; a sleeve mounted on said shaft; and adjustable means connecting said hub and sleeve.

10. In a marking-machine, the combination of a shaft, a head comprising a marking-strip effective to wrap about an object to be marked; means to so wrap the same, operative partly by such strip; means comprising a plunger, operative by the object and coöperative with said strip, to operate the wrapping means; a hub provided with a bore having flaring ends and effective to permit the same to rock upon said shaft; a carrier comprising circular members having object-receiving serrations; and means for advancing the carrier step by step.

11. In a marking-machine, the combination of a plurality of marking devices; a plurality of means for supplying marking material thereto; means for intermittently moving such supply means; means comprising a roller and a leaf for intermittently feeding marking material to such supply means; and means for intermittently operating such leaf.

12. In a marking-machine, the combination of a carrier for the objects to be marked, effective to be advanced step by step; means for so advancing the carrier; means for supplying marking material located adjacent to the carrier; a marking-head comprising a flexible marking-strip effective to wrap about an object to be marked, means to so wrap the same operative partly by said strip, and means operative by the object and coöperative with said strip to operate the wrapping means, and comprising a plunger and a shoe or platen carried thereby; means embodying a spring effective to apply tension to said strip, means for regulating the pressure of such spring; a hub or collar carrying the head and provided with a bore having flaring ends and effective to permit the same to rock upon a shaft; a shaft upon which said hub is mounted, traversing the supply means; a sleeve mounted on the shaft; adjustable means connecting said hub and sleeve; means connecting said shaft to the framework, embodying an arm and pivot; and means embodying an adjustable bar and roller and a cam for oscillating said shaft on its pivot; and means embodying a bar, roller and cam and a bell-crank lever for moving said head to and fro on said shaft.

13. The combination of a marking-strip effective to wrap about an object to be marked, means comprising side members effective to so wrap the same, and operative by said strip, and pinions secured to said side members and in mesh.

14. The combination of a marking-strip effective to wrap about an object to be marked, means comprising side members effective to so wrap the same and operative by said strip, and pinions secured to said side members and in mesh.

15. The combination of a marking-strip effective to wrap about an object to be marked; members effective to so wrap the same and operative by said strip; pinions in mesh secured to said members; and toggle-joints connecting said members.

16. The combination of a marking-strip effective to wrap about an object to be marked; means to so wrap the same, operative partly by such strip; and means comprising a plunger operative by the object and coöperative with said strip to operate the wrapping means.

17. The combination of a marking-strip effective to wrap about an object to be marked; means to so wrap the same, operative partly by said strip; and means operative by the object and coöperative with said strip to operate the wrapping means, and comprising a plunger, and a shoe or platen carried thereby.

18. In a marking device, the combination of yielding members; a marking-strip carried thereby; means for applying tension to such strip; and means for regulating such tension thereof.

19. In a marking device, the combination of a flexible marking-strip; means for yieldably supporting the ends of such strip; means embodying a spring effective to apply tension to said strip; and means for regulating the pressure of such spring.

20. In a marking-machine, the combination of supporting means; a marking-strip; side members pivoted to the supporting means and carrying said marking-strip below such pivotal point; a toggle-joint uniting said members thereabove; and means effective upon said member through said toggle-joint to bring the lower ends toward each other.

21. In a marking-machine, the combination of supporting means a marking-strip; members pivoted to said supporting means and carrying said marking-strip therebelow; and a toggle-joint uniting said members

thereabove, said strip and toggle effective to bring the lower ends of such strip toward each other and thereby flex such strip.

22. In a marking-machine, the combination of a frame; pinions pivoted to said frame and in mesh with each other; side members carried by the pinions; a flexible marking-strip carried by said side members; a toggle-joint connecting the side members; and a shoe or platen connected with said toggle and effective upon coming in contact with the object to be marked to operate the toggle and cause the side members to approach each other and to flex the strip, and, upon such members completely wrapping the strip about the object, to afford a platen for such strip.

23. In a marking device, the combination of a frame; pinions pivoted to said frame and in mesh with each other; side members carried by the pinions; a flexible marking-strip carried by said members below said pinions; a toggle-joint connecting the ends of said side members above said pinions; a plunger attached to the toggle-joint; a shoe or platen carried by the plunger above the marking-strip and effective upon the strip coming in contact with it and the object to be marked to operate the toggle-joint and cause the strip-bearing ends of said members to approach each other and to flex the strip, and, upon said member completely wrapping the strip about the object, to afford a platen for such strip.

24. In a marking device, the combination of a frame; pinions pivoted to said frame and in mesh with each other; side members carried by the pinions; a flexible marking-strip carried by said members below said pinions; a toggle-joint connecting the ends of said side members above said pinions; a plunger attached to the toggle-joint; a shoe or platen carried by the plunger above the marking-strip; and adjustable means for applying tension to the strip.

25. In a marking device, the combination of a frame; pinions pivoted to said frame and in mesh with each other; side members carried by the pinions; a flexible marking-strip carried by said members below said pinions; a toggle-joint connecting the ends of said side members above said pinions; a plunger attached to the toggle-joint; a shoe or platen carried by the plunger above the marking-strip and secured to one of the same; a screw-head on the pin; a pin passing through the arms; and a spring between the screw-head and one of the arms.

26. A marking-head comprising a yieldable marking-strip, a shaft, and a hub thereon carrying the head and provided with a bore having flaring ends whereby the same may be rocked lengthwise of said shaft.

27. A marking-head; a shaft; a hub carrying said head mounted upon said shaft and effective to rock thereon; a sleeve mounted on said shaft; and adjustable means connecting said hub and sleeve.

28. A marking-head; a shaft; a hub carrying said head and provided with a bore having flaring ends and effective to rock on said shaft; a sleeve mounted on said shaft; an adjustable means connecting said hub and sleeve comprising an arm provided with slots secured to one of such members; a pin on the other of said members entering one of said slots; and a set-screw effective to adjust and maintain in its adjusted position said arm.

29. In a marking-machine, a rotatable device having notches for receiving and holding the objects to be marked, and means for imparting a step-by-step movement to said device, a marking-material-supply device, a slidable marking-head, and means for carrying the same to a position before first one of said devices and then the other, and means for moving said head toward and from each of said devices.

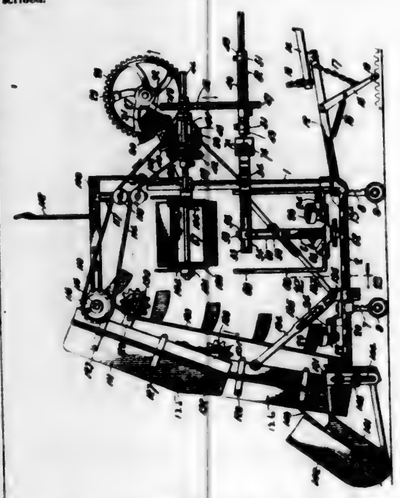
709,012. GRAIN-ELEVATING MACHINE. MARTIN W HEYNEMA, near Rankin, Ill. Filed June 8, 1901. Serial No. 63,861. (No model.)

Claim.—1. In a machine of the class described, the combination of a frame provided at its bottom with wheels, a conveyer carried by the frame, said frame being adapted to be placed within a wagon-body, an operating-lever fulcrumed on the frame, and means carried by the operating-lever for engaging the wagon-body to advance the frame, substantially as described.

2. In a machine of the class described, the combination of a frame designed to be mounted within a wagon-body, and provided with means for engaging the same, whereby the frame is guided in its forward movement, a conveyer carried by the frame, and means for advancing the frame, substantially as described.

3. In a machine of the class described, the combination of a frame designed to be mounted on a wagon-body, a conveyer carried by the frame for removing the contents of the wagon-body, a ratchet-bar mounted on the wagon-body, a lever fulcrumed on the frame, a pawl depending from the lever and engaging the ratchet-bar, means for limiting the forward movement of the pawl, and a spring for actuating the pawl for returning the same to its initial position, substantially as described.

4. In a machine of the class described, the combination of a frame designed to be mounted on a wagon-body, a conveyer carried by the frame and adapted to remove the contents of the said body, a foot-lever fulcrumed on the frame and provided with a pawl for actuating the same, a gear-wheel located above the foot-lever and having a handle, and gearing connecting the gear-wheel with the conveyer, substantially as described.



5. In a machine of the class described, the combination of a frame provided with wheels and designed to be mounted in a wagon-body, the spring-actuated antifriction-wheels located at opposite sides of the frame and arranged to engage the sides of the wagon-body, a conveyer carried by the frame, and means for advancing the frame in the wagon-body, substantially as described.

6. In a machine of the class described, the combination of a frame designed to be arranged on a wagon-body and provided with a conveyer, and a hoisting device connected with the frame and adapted to support the same in an elevated position to permit a wagon to be driven to and from the same, substantially as described.

7. In a machine of the class described, the combination of a frame designed to be arranged on a wagon-body and provided with a conveyer, and a hoisting device connected with the said frame and adapted to support the same in an elevated position and provided with a frame composed of uprights spaced apart to permit a wagon to be driven between them, and a connecting top portion, substantially as described.

8. In a machine of the class described, the combination of a frame designed to be mounted on a wagon-body, means for advancing the frame therein, a front conveyer mounted on the frame, an inner transverse conveyer carried by the frame and arranged to receive material from the front conveyer, and an outer conveyer extending from the inner conveyer and designed to be mounted on a bin or crib, substantially as described.

9. In a machine of the class described, the combination of a frame designed to be mounted on a wagon-body, means for advancing the frame on the same, a conveyer carried by the frame, an outer conveyer designed to be mounted on a crib or bin and adjustably supported, whereby it is adapted to accommodate itself to the movement of the frame, and means for connecting the said conveyers, substantially as described.

10. In a machine of the class described, the combination of a frame designed to be mounted on a wagon-body, means for advancing it thereon, a front conveyer carried by the frame, a scoop arranged at the lower end of the front conveyer, and a hinged apron or section arranged at the top of the scoop, substantially as described.

11. In a machine of the class described, the combination of a frame designed to be mounted on a wagon-body, means for advancing the frame on the same, a front conveyer carried by the frame and provided with upper and lower adjustable sections, and a scoop arranged at the bottom of the conveyer and adjustably mounted on the said frame, substantially as described.

12. In a machine of the class described, the combination of a frame designed to be mounted on a wagon-body, means for advancing the frame thereon, a conveyer carried by the frame, an inner pivoted fork or yoke connected with and carried by the frame, an outer fork or yoke designed to be pivotally mounted on a crib or bin, and an outer conveyer hinged to the inner fork or yoke and slidably and pivotally connected with the outer fork or yoke, substantially as described.

13. In a machine of the class described, the combination of a frame designed to be mounted on a wagon-body, means for advancing the frame thereon, a conveyer carried by the frame, an inner pivoted support carried by the frame, an outer pivoted support designed to be mounted on a crib or bin, and an outer conveyer connected with the said supports substantially as described.

14. In a machine of the class described, the combination of a frame designed to be mounted on a wagon-body, means for advancing the frame thereon, a conveyer carried by the frame, an inner pivoted support also carried by the frame, an outer pivoted support designed to be mounted on a crib or bin, and an outer conveyer mounted upon the said supports and slidably connected with the outer support, substantially as described.

15. In a machine of the class described, the combination of a frame designed to be mounted on a wagon-body, a conveyer carried by the frame, an outer pivoted support designed to be mounted on a crib or bin, an inner pivoted support carried by the frame, and an outer conveyer hinged to the inner support and slidably and pivotally connected with the outer support, substantially as described.

16. In a machine of the class described, the combination of a frame designed to be mounted on a wagon-body, a conveyer carried by the frame, an inner pivoted support also carried by the frame, an outer pivoted support designed to be mounted on a crib or bin, and an outer conveyer mounted on the inner support and having a slide arranged on the outer support and capable of longitudinal movement, substantially as described.

17. In a machine of the class described, the combination of a frame designed to be mounted on a wagon-body, a conveyer carried by the frame, an inner pivoted fork or yoke carried by the frame, an outer pivoted fork or yoke designed to be mounted on a crib or bin and provided at opposite sides with antifriction-wheels arranged in pairs, and an outer conveyer mounted on the inner fork or yoke and provided with slides arranged between the antifriction-wheels of the outer fork or yoke, substantially as described.

18. In a machine of the class described, the combination of a frame designed to be mounted on a wagon-body, a conveyer carried by the frame, an inner pivoted fork or yoke carried by the frame, an outer pivoted fork or yoke provided with means for securing it to a crib or bin and having slots or openings at its sides, brackets adjustably secured at the slots or openings by fastening devices arranged therein, said brackets being provided with wheels arranged in pairs, and an outer conveyer provided with slides arranged between the said wheels said outer conveyer being also provided with pivots arranged in bearings of the inner fork or yoke, substantially as described.

19. In a machine of the class described, the combination of a frame designed to be mounted on a wagon-body, means for advancing it on the same, an inner upright front conveyer, a scoop arranged at the bottom thereof, an inner transverse conveyer carried by the frame and arranged to receive material from the front conveyer, an outer transverse conveyer pivotally connected with the frame, gearing connecting the conveyers, and a flexible connection constituting a portion of the gearing and adapted to accommodate itself to the movements of the frame and the outer conveyer, substantially as described.

20. In a machine of the class described, the combination of a frame designed to be mounted on a wagon-body, a front conveyer carried by the frame, an inner transverse conveyer, a bracket adjustably secured to the frame and extending laterally therefrom, an inner fork or yoke pivotally connected with the bracket, a bar provided with clamps, an outer fork or yoke pivotally mounted on the bar, and an outer conveyer supported by the inner and outer forks or yokes, substantially as described.

21. In a machine of the class described, the combination of a frame designed to be mounted on a wagon-body and adapted to be moved longitudinally thereof, a conveyer carried by the frame, an outer conveyer designed to be connected with a crib or bin and provided with a shaft having a head, a shaft carried by the frame and connected with the conveyer thereof and provided with a head, casings receiving the heads of the shafts, a coupling-rod slidably connected with the casings, and a coiled spring disposed on the coupling-rod and interposed between the casings, substantially as described.

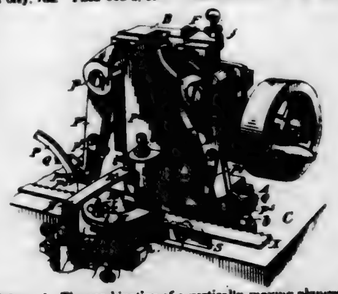
22. The combination of a frame designed to be mounted on a wagon-body, means for advancing the frame thereon, a front conveyer mounted on the frame, an inner transverse conveyer arranged in rear of the front conveyer, an outer transverse conveyer, the shaft 39 journaled in suitable bearings of the frame and disposed transversely thereof, sprocket-gearing connecting the shaft 39 with the front conveyer, the shaft 44 forming a part of the inner transverse conveyer, gearing connecting the said shafts for operating the inner transverse conveyer, and sprocket-gearing connecting the shaft 44 with the outer transverse conveyer, substantially as described.

23. In a machine of the class described, the combination of a frame designed to be mounted on a wagon-body, a front conveyer mounted on a frame, an inner transverse conveyer carried by the frame and having a shaft 44 extending from one end of it, the shaft 39 disposed transversely of the frame, gear-wheels connecting the said shafts, the outer transverse conveyer having a shaft 71, the shaft 48 arranged in alinement with the shaft 71, a flexible coupling connecting the shafts 48 and 71, sprocket-gearing connecting the shaft 39 with the front conveyer, means for operating the shaft 39, and gearing connecting the shafts 44 and 48, substantially as described.

24. In a machine of the class described, the combination of a frame designed to be mounted on a wagon-body, a front conveyer carried by the frame, an inner transverse conveyer having an extended shaft 44, a bracket or bar extending rearward from the frame, rods adjustably mounted on the bracket or bar and provided with bearings, the shaft 48 journaled in the said bearings, gearing connecting the shafts 44 and 48, an outer conveyer having a shaft flexibly connected with the shaft 48, a transverse shaft 39 connected with the shaft 44 and provided with a gear-wheel 38, a gear-wheel 28 meshing with the gear-wheel 38 and provided with a handle, and gearing connecting the shaft 39 with the front conveyer, substantially as described.

25. In a machine of the class described, the combination of a frame designed to be mounted on a wagon-body and adapted to be moved longitudinally thereof, a front conveyer carried by the frame, an inner transverse conveyer mounted on the frame, an outer transverse conveyer pivotally connected with the frame and slidably connected with a suitable support, the shaft 48 carried by the frame and flexibly connected with the outer transverse conveyer, operating mechanism, and gearing for connecting the same with the shaft 48 and with the front and inner transverse conveyers, substantially as described.

709,013. SAW-SETTING MACHINE. JACOB E. HILLSTROM, Michigan City, Ind. Filed Oct. 2, 1901. Serial No. 77,287. (No model.)



Claim.—1. The combination of a vertically-moving plunger, means for operating it, a support for the saw, a feed-dog, a lever to which it is pivoted, a spring for moving the lower end of the lever outwardly, and an inclined surface on the upper end of the plunger engaging the lever for moving its lower end inwardly.

2. A saw-setting machine comprising a vertically-moving plunger, an anvil coöperating therewith, a saw holder or clamp, a guide-plate for the front or toothed end of the saw, and means for adjusting the guide-plate toward and from the saw-holder in a direction at right angles to the direction in which the saw moves.

3. A saw-setting machine, comprising a vertically-moving plunger having a tapered upper end, a dog-carrying lever having at its upper end an inwardly-projecting portion engaging the inclined upper end of the plunger, and a spring for moving the lower end of the lever outwardly.

4. A saw-setting machine comprising a vertically-moving plunger, a feed-dog, means for operating it, a guide-plate in contact with which the end of the dog moves, and by which the dog is guided, and means for adjusting the guide-plate in a direction at right angles to the direction in which the saw moves.

5. A saw-setting machine, comprising a vertically-moving plunger, a feed-dog, a guide-plate for the dog, and means for adjusting the position of the plate in the line of movement of the dog, and also at right angles relatively thereto.

6. In a saw-setting machine the combination of a frame, a saw-holder arranged to hold the saw in a horizontal plane, a dog-carrying lever pivoted to the frame above the saw-holder and arranged to move in the same direction as the saw, a dog pivoted to the dog-carrying lever at is lower end and arranged to move relatively to the dog-carrying lever about an axis at right angles to the line of movement of the saw and also to move relatively to the dog-carrying lever about an axis perpendicular to the line of movement of the saw, and a spring for moving the dog horizontally toward the saw.

7. In a saw-setting machine, the combination of a dog-carrying lever adapted to move in a direction parallel with the line of movement of the saw, an anvil, a dog pivoted to the dog-carrying lever, and devices whereby the pivot of the dog may be adjusted on the lever toward and from the anvil.

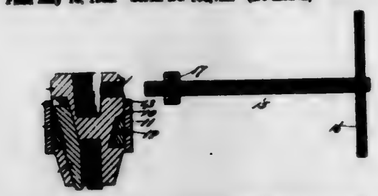
8. The combination of the bed-plate, the lower member of the clamp, adjustably connected therewith, the upper member of the clamp pivoted to the lower member, and a pivoted spring-finger for pressing the upper member of the clamp toward the lower member.

9. The combination with the bed-plate of the machine, of the lower member of the clamp, pivotally connected with the bed-plate, devices for adjusting the position of the lower member vertically relatively to the bed-plate without changing its inclination, and for also adjusting its inclination thereon, the upper member of the clamp pivoted to the lower member, and the gage adjustable longitudinally on the clamp.

10. The combination with the bed-plate of the machine, of the lower member of the clamp pivoted thereto, and adjustable vertically thereon, the upper member of the clamp pivotally connected with the lower member, the gage adjustable longitudinally on the clamp, and the spring-finger pivoted to the lower member of the clamp, and adapted to engage the upper member.

11. In a saw-setting machine, the combination of the bed-plate, the fixed dogs, means for operating them, a holder for the saw, a plate formed with a tongue and moving in the grooves in the bed-plate toward and from the saw-holder, guides on the end of said plate next the saw-holder, and means for adjusting the guides toward and from each other in a direction parallel with the line of movement of the saw.

709,014. DRILL-CHUCK. ARTHUR I. JACOBS, Hartford, Conn. Filed May 10, 1902. Serial No. 106,722. (No model.)

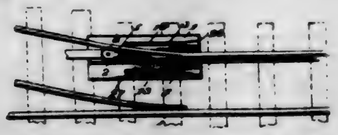


Claim.—1. A drill-chuck having a body with an annular outwardly-opening nut-recess and axially-inclined jaw-recesses, jaws movable in the jaw-recesses and having exterior threads, a nut movable in the nut-recess and having interior threads engaging the threads on the jaws, a sleeve encircling the body, attached to the nut and having on its edge teeth that are adapted to be engaged by a toothed key, substantially as specified.

2. A drill-chuck having a body with an annular outwardly-opening nut-recess and axially-inclined jaw-recesses, jaws movable in the jaw-recesses and having exterior threads, a nut formed in sections, movable in the nut-recess and having interior threads engaging the threads on the jaws, a sleeve encircling the body, attached to the nut-sections and having on its edge teeth that are adapted to be engaged by a toothed key, substantially as specified.

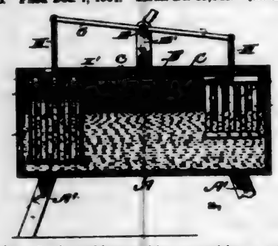
3. A drill-chuck having a body with an annular outwardly-opening nut-recess and axially-inclined jaw-recesses, jaws movable in the jaw-recesses and having exterior threads, a nut movable in the nut-recess, encircling the jaws and having interior threads engaging the threads on the jaws, a sleeve encircling the body outside of the nut-recess, attached to the nut and having teeth on its edge, and a key-recess in the body back of the sleeve adapted to receive a toothed key, substantially as specified.

709,015. AUTOMATIC RAILWAY-SWITCH. GEORGE B. JAMES, Cleveland, Ohio. Filed Dec. 30, 1901. Serial No. 88,702. (No model.)



Claim.—In a railway-switch, and in combination with the switch-point, and a pivoted switch-bar connected with the switch-point for actuation thereof and having its opposite ends beveled, plates or bars pivotally connected with the beveled ends of the said switch-bar, substantially as set forth.

709,016. WASHING-MACHINE. MARY R. KELLY, Jackson, Ohio. Filed Dec. 7, 1901. Serial No. 85,041. (No model.)



Claim.—1. A washing-machine comprising a tub or receptacle a shaft journaled therein and having arms projecting from either side thereof, buckets pivotally connected to the outer end of said arms, brackets arranged upon the tub and having a shaft journaled therein, arms projecting laterally from the shaft and having rods connected to their outer ends, the lower ends thereof being provided with plungers working in the buckets and means for rocking the last-named shaft, substantially as and for the purpose described.

2. In a washing-machine, the combination of a tub or receptacle, a shaft journaled therein, arms projecting from the said shaft, buckets carried by the arms, brackets secured to the tub, a shaft journaled in the brackets, arms projecting from the last-named shaft, plungers connected to the arms and working in said buckets and means connected to the said last-named shaft for operating it and the said plungers, substantially as shown and described.

709,017. CAN. JOHN H. KUECHENMEISTER, St. Louis, Mo., assignor of one-half to Henry Knochenmeister, St. Louis, Mo. Filed Nov. 19, 1901. Serial No. 83,211. (No model.)

Claim.—1. A can or the like comprising a body of yielding material, and a head having a flange adjacent the same, said flange having its material beat throughout its thickness to produce corrugations which are embedded in the surface of the material of which the can-body is composed and extend diagonally across the longitudinal axis of said can-body.

2. A can or the like comprising a body, a head, and corrugated plates upon said head and engaging opposite sides of said body, the corrugations of one of said plates extending at an angle different from that at which the corrugations of the other of said plates extend; substantially as described.

3. A can or the like comprising a body, a head, and corrugated plates upon said head and engaging opposite sides of said body, the corrugations of one of said plates extending at an angle opposite to the angle at which the corrugations of the other of said plates extend and the corrugations of one plate crossing the lines of the corrugations of the other plate; substantially as described.

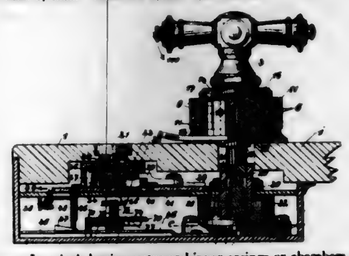
4. A joint for cans and the like comprising overlapping sheet portions, one of said sheet portions being of yielding material, and the other of said sheet portions being beat throughout its thickness to produce corrugations which are embedded in the surface of said yielding material and extend at an angle to the transverse axis of the joint; substantially as described.

5. A joint for cans and the like comprising overlapping sheet portions, one of said sheet portions being of yielding material, and the other of said sheet portions being beat throughout its thickness to produce corrugations which are embedded in the surface of the said yielding material and extend diagonally across the longitudinal axis of said joint; substantially as described.

6. A joint for cans and the like comprising a sheet portion upon one of the joined parts, and corrugated sheet portions upon the other of said joined parts and engaging upon opposite sides of said first-mentioned sheet portion, the corrugations of one of said corrugated sheet portions extending at an angle different from that at which the corrugations of the other of said corrugated sheet portions extend; substantially as described.

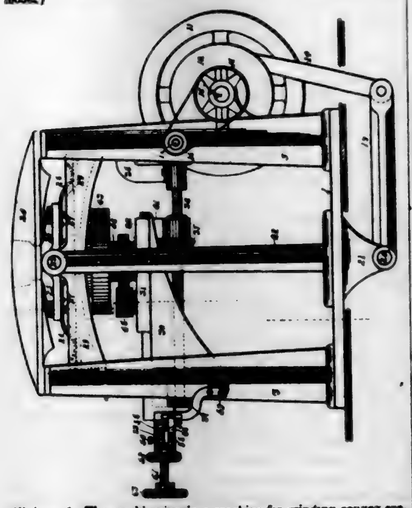
7. A joint for cans and the like comprising a sheet portion upon one of the joined parts, corrugated sheet portions upon the other of said joined parts and engaging upon opposite sides of said first-mentioned sheet portion, the corrugations of one of said corrugated sheet portions extending at an angle opposite to the angle at which the corrugations of the other of said corrugated sheet portions extend, and the corrugations of one of said corrugated sheet portions crossing the lines of the corrugations of the other thereof; substantially as described.

709,018. LOCK. CARL KUHNELMANN, Sickingen, Germany. Filed Mar. 5, 1900. Serial No. 7,961. (No model.)



Claim.—In a lock having outer and inner casings or chambers, the combination of a main bolt adapted to be actuated by a key, an auxiliary bolt or bolts, a rotating handle for actuating said auxiliary bolts, means whereby said handle may be locked and unlocked against rotation, a plug for closing the keyhole or entrance to the outer casing of the lock, devices controlled by the rotation of said handle for releasing said plug, a movable barrier located behind said plug and adapted to oppose the entrance of a key to said inner chamber, means controlled by the key for removing said barrier, and means located behind said barrier and also controlled by the key whereby said main and said auxiliary bolts may be released.

709,019. MACHINE FOR GRINDING GLASS. WILLIAM LABODEY, Akron, Ohio. Filed Jan. 24, 1902. Serial No. 91,086. (No model.)



Claim.—1. The combination in a machine for grinding convex surfaces consisting of an oscillating grinding-head, springs to bear upon the upper surface of said grinding-head, means to adjust the inclination of said grinding-head, means to hold the article to be ground, and means to revolve said holder, means to oscillate said grinding-head, and means to convey said article to be ground against said grinding-head, substantially as shown and described.

2. The combination in a machine for grinding convex surfaces consisting of a grinding-head, means to vary the vertical inclination of either end of said grinding-head, a pair of arms to sustain said grinding-head, horizontal guides to guide said grinding-head, means to hold the article to be ground, a lever to oscillate the arms bearing said grinding-head, a second lever and a power-driven crank to operate the hereinbefore-described mechanism.

3. The combination in a machine for grinding convex surfaces consisting of an oscillating grinding-head capable of vertical inclination on either side, means to adjust this inclination, a grinding-head to hold the article to be ground, a pan surrounding said holder to receive particles ground from the surface of said article, a transversely-moving carriage to sustain said holder and pan, and means to move said carriage on its support transversely, substantially as shown and described.

4. The combination in a machine of the class designated of an oscillating grinding-head, means to vary the vertical inclination of said grinding-head, and means to retain said grinding-head in a desired position, a holder to sustain the article to be ground, a carriage to sustain said holder, transverse ways to sustain said carriage, means to slide said carriage on said ways, and means to raise said holder on said carriage, substantially as shown and described.

5. The combination in a machine for grinding convex surfaces of an oscillating grinding-head, means to vary the vertical inclination of said head, a holder to sustain the article to be ground, a carriage to sustain said holder, a threaded nut on said carriage to raise said holder, and means to rotate said nut and raise said holder vertically, substantially as shown and described.

6. The combination in a machine for grinding convex surfaces of an oscillating head, means to cause said head to oscillate, means to revolve said article, means capable of lateral adjustment to bring said article in alinement with said grinding-head, substantially as shown and described.

7. The combination in a machine for grinding convex surfaces of an adjustable oscillating head, means to cause such oscillation, means to revolve the article to be ground, means to automatically force said article against said grinding-head, and independent means for the lateral adjustment of said article, substantially as shown and described.

8. The combination in a machine for grinding convex surfaces consisting of a grinding-head, means to retain said head at a desired vertical inclination, a holder to sustain the article to be ground, a carriage to sustain said holder, means to revolve said holder, means to raise said holder vertically on said carriage, and independent means to adjust the lateral position of said carriage in said machine, substantially as shown and described.

709,020. GLASS GRINDING AND POLISHING MACHINE. WILLIAM LABODEY, Akron, Ohio. Filed Mar. 6, 1902. Serial No. 96,919. (No model.)

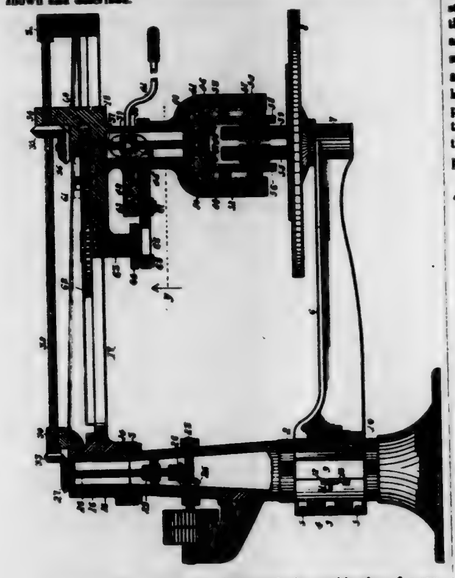
Claim.—1. In a machine of the class designated, the combination of an upright supporting-post, a swinging arm pivoted on the upper end of said post, a carriage adapted to travel along said swinging arm, means mounted on said carriage for supporting grinding and polishing mechanism, means to convey power from said post through said swinging arm to said grinding and polishing mechanism, and means to cause said grinding and polishing mechanism to rotate less than a revolution.

2. In a machine of the class designated, the combination with a supporting-post, mechanism mounted on said post to receive power from any desired source, a swinging arm pivoted on said post, means to convey power from said post to said swinging arm, a carriage mounted on said arm, means to cause said carriage to travel along said arm, mechanism depending from said carriage for grinding and polishing glass, and means mounted on said carriage to cause said grinding and polishing mechanism to alternately revolve vertically less than a complete revolution.

3. The combination of a supporting-post, an arm pivoted to said post, a traveling carriage on said arm, a depending portion on said carriage, a head mounted on said depending portion capable of revolution on said portion, grinding and polishing wheels mounted in said head, means to convey power from said post to said grinding and polishing mechanism, and means to cause a partial revolution of said head, substantially as shown and described.

4. In a machine of the class designated, the combination of a supporting-post, an arm pivoted on said post, a traveling carriage on said arm, a depending portion on the under face of said carriage, a revolvable head on said depending portion, grinding and polishing mechanism in said head, means to convey power from said post to said grinding and polishing mechanism, a rocking arm mounted in said carriage, a crank to operate said arm, and means to cause said arm to rotate said head a portion of a revolution.

5. The combination in a machine of the class designated, of a post, a swinging arm pivoted on said post, a carriage mounted on said arm, a head mounted on said carriage, a pair of grinding and polishing wheels mounted in said head, mechanism to cause said grinding and polishing wheels to revolve in opposite directions to one another, substantially as shown and described.



6. In a machine of the class designated, the combination of a supporting-post, of a swinging arm pivoted on said post, a carriage on said arm capable of longitudinal movement thereon, a head mounted on said carriage, a pair of grinding and polishing wheels mounted in said head, mechanism to cause said grinding and polishing wheels to revolve in opposite directions to one another, and means to cause said head to revolve on said carriage, substantially as shown and described.

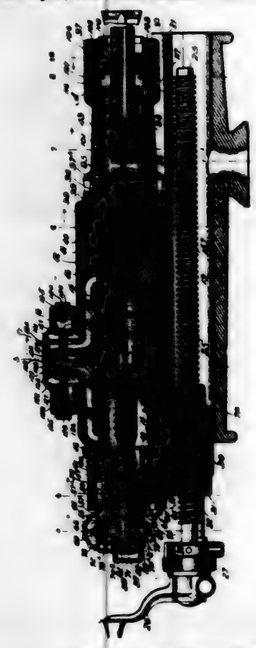
7. The combination in a machine of the class designated, of a supporting-post, a swinging arm mounted thereon, a traveling carriage on said arm, a head mounted on said carriage, gear-teeth on the upper end of said head, two grinding and polishing wheels mounted in said head, mechanism to cause said wheels to rotate in opposite directions to one another, a rocking arm provided with teeth to mesh with the teeth on said head, and means to rock said arm, substantially as shown and described.

8. The combination in a machine of the class designated with a supporting-post of a swinging arm, a carriage slidable on said arm, a head mounted on said said carriage, two grinding-wheels mounted in said head, means to cause said grinding-wheels to revolve in opposite directions to one another, and means to vary the vertical position of said head on said carriage as desired, substantially as shown and described.

709,021. BICYCLE-TIRE. HERBERT DU BOIS LEFFERTS, New Brunswick, N. J. Filed Dec. 27, 1899. Serial No. 741,744. (No model.)

Claim.—The method of making a bicycle-tire, which consists in assembling (1) a strip of strengthening material treated with a solution of raw rubber and having its ends cut on the bias, (2) a second strip of rubber longer and narrower than the first strip and temporarily cemented thereto and having its ends cut straight, (3) a third rubber-saturated strip of strengthening material longer than the second strip and of substantially the same width, the second strip projecting slightly beyond one edge of the first strip and lying within the opposite edge thereof, and the third strip being extended beyond one edge of the second strip and lying within the opposite edge thereof, and, (4) a tread-strip fixed to the third strip and of less width than the other three strips, then lapping and rolling successively the ends of the strengthening-strip, second strip, third strip and tread-strip, the ends of the several strips breaking joints, then overlapping and cementing the edges of the strips, leaving the tread-strip disposed on the inside of the tire thus formed, then partially inflating the tire, then subjecting it to a bath of boiling water, and finally reversing the tire to bring the tread-strip on the outside, substantially as and for the purpose specified.

709,022. ROCK-DRILLING ENGINE. JOHN G. LEYNER, Denver, Colo. Filed July 13, 1901. Serial No. 68,308. (No model.)



Claim.—1. In a rock-drilling engine, the combination with the cylinder having a piston-bore and a plurality of counterbores in its front end of different diameters, of a front cylinder-head comprising a tubular member threadedly secured to the largest counterbore of said cylinder, and a steel ring seated in a counterbore against the end of said cylinder-head, a buffer-ring seated in a counterbore against said steel ring, and a steel ring seated in a counterbore against said buffer-ring, substantially as described.

2. In a rock-drilling engine, the combination with the cylinder and the rock-cutting drill-bit of a piston reciprocally mounted therein, provided with a ram extension, having its periphery formed into straight flutes, a front cylinder-head secured to said cylinder, a chuck rotatably secured in said front cylinder, provided with an axial bore, a rifled nut surrounding said ram and secured in the bore of said chuck, and fitting slidably the flutes of the ram of said piston, substantially as described.

3. In a rock-drilling engine the combination with the cylinder, of a valve-chest cast integral with said cylinder, an axial bore in valve-chest, a valve reciprocally mounted in said valve-chest, suitable actuating-fluid inlet and exhaust ports from said valve-chest to said cylinder, coöperatively arranged in operation relative to said valve, a threaded plug secured in each end of said valve-chest, provided with a slight projection on its inner end of less diameter than the bore of said valve-chest, and a slot port diametrically across said slightly-projecting end of said plugs, substantially as described.

4. In a rock-drilling engine the combination of a cylinder having an operative valve mechanism and actuating-fluid inlet and exhaust ports, counterbores in the opposite ends of said cylinder, a front head secured to the front end of said cylinder, a back head secured to the rear end of said cylinder, a steel ring seated in a counterbore at each end of said cylinder's axial bore, a rubber buffer-ring operatively seated between said steel ring and the rear cylinder-head, a rubber buffer-ring seated against said steel ring at the front end of said cylinder, a steel ring seated in a counterbore between said rubber ring and the end of said front cylinder-head and a piston reciprocally mounted in said cylinder between said steel buffer-rings and provided with a ram extension projecting through said steel rings and rubber at the front end of said cylinder into the front cylinder-head, substantially as described.

5. In a rock-drilling engine the combination with the cylinder and the piston, of a tubular-shaped front cylinder-head, secured to one end of said cylinder and extending beyond it, a tubular drill-holding chuck rotatably mounted in said front cylinder-head, a reciprocating piston in said cylinder provided with a hammer extension, a straight fluted surface on the periphery of the end of said piston's hammer extension, a fluted nut secured in said chuck in which said piston's hammer extension fits slidably and a rock-cutting drill-bit having a shank adapted to fit loosely in said chuck and positioned in the reciprocal path of the hammer extension of said piston, and means, including a ring, for securing said drill-bit operatively in said tubular chuck, substantially as described.

6. In a rock-drilling engine, the combination with the cylinder, and the hammer-piston of a tubular-shaped front cylinder-head, secured to said cylinder-head, and extending beyond it, a cap threadedly secured to its outer end having an axial bore, a buffer bearing against the crown of said cap, a steel ring arranged adjacent to said buffer, a drill-bit-holding chuck revolubly mounted in said cylinder-head, and secured therein against longitudinal movement, a rock-cutting drill-bit having a shank provided with projecting lugs, adapted to fit loosely in said cap and in said drill-bit-holding chuck and positioned in the reciprocal path of said hammer-piston, and means including a ring arranged between said chuck and the buffer of said cap for releasably locking said drill-bit in operative striking relation to said hammer-piston in said chuck, substantially as described.

7. In a rock-drilling engine the combination with the cylinder, the hammer-piston and the front and rear cylinder-heads, provided with axial bores, a suitable buffer mechanism in the front and rear end of said cylinder at the ends of the reciprocal movement of said piston, an axial bore in said piston, a spirally-rifled nut in the axial bore of said piston, a chamber in the rear end of said rear cylinder-head, a rifled bar rotatably mounted in said rear cylinder-head having a disk portion extending into said chamber, ratchet-teeth on the periphery of said disk, spring-controlled pawls arranged in said chamber in operative relation to said ratchet-toothed disk, a spirally-rifled bar extending from said ratchet-disk slidably through the said spirally-fluted nut of said hammer-piston, a supplementary cylinder secured to said back cylinder-head, an axial bore in said cylinder-head coöperatingly arranged with said back cylinder-head to operatively support said spring-controlled pawls, substantially as described.

8. In a rock-drilling engine the combination with the cylinder, the front cylinder-head and the cap on the end of said front cylinder-head, of the piston in said reciprocating cylinder, the drill-chuck rotatably mounted in said front cylinder-head, the rifled nut in said chuck, the fluted hammer or ram of said piston, extending loosely through said fluted nut into said chuck, the bifurcation in the outer end of said chuck, the oppositely-arranged stops in the opposite ends of the bifurcation of said chuck, an axial bore in said chuck, a rock-cutting drill-bit having a shank adapted to fit loosely into said chuck and adapted to extend into the reciprocal path of said piston hammer or ram projecting lugs in said rock-cutting drill-bit's shank, adapted to fit the bifurcation in the end of said chuck and means, including a ring within said cap for operatively securing and interlocking said rock-cutting drill-bit to and from said chuck, means for rotating said drill-bit and means, including a valve-controlled water-conveying tube extending axially through said piston and an axial hole through said drill-bit for conveying a commingled supply of air and water to the cutting end of said drill-bit, substantially as described.

9. In a rock-drilling engine the combination of the cylinder, the hammer-piston, the front head threadedly secured to said cylinder, and the cap threaded to said front head with the chuck-key and the buffer in the cap, substantially as described.

10. In a rock-drilling engine the combination of the cylinder, the front cylinder-head and the cap, with the hammer-piston reciprocally mounted in said cylinder and the front head, of the drill-holding chuck arranged to be rotated step by step by said piston, the buffer in said cap, the chuck-key ring, and the drill-bit arranged to be releasably secured operatively in said chuck by said chuck-key in the reciprocal path of said hammer-piston, substantially as described.

11. In a rock-drilling engine the combination with the cylinder, the piston, the front cylinder-head, and the cap, of the chuck rotatably mounted in said front cylinder-head, and provided with a centrally-slotted end having its ends on the opposite sides of said slot provided with stepped shoulders, the buffer in said cap, the chuck in its outer end, the key-ring between said chuck and said buffer, having an axial bore provided with oppositely-disposed slots extending from said bore into said ring, and provided with oppositely-arranged projecting lugs in its side facing said chuck, adapted to engage said stepped shoulders when moved in one rotative direction, and to engage the sides of the ends of said slotted end, when moved in the opposite rotative direction, a drill-bit having a shank end provided with projecting lugs adapted to extend loosely through the axial bore and slots of said chuck and key-ring and into the slot in the end of said chuck and means for turning said chuck-key ring to lock said drill-bit in said chuck and to unlock it from said chuck, substantially as described.

12. In a rock-drilling engine, the combination with the cylinder and the rear and front cylinder-heads detachably secured to said cylinder, of a piston provided with a hammer or ram extension reciprocally mounted in said cylinder a drill-bit-holding chuck rotatably mounted in said front head suitable buffer devices operatively arranged between the said front head and chuck and the adjacent terminal stroke of said piston and between the rear cylinder-head and the adjacent terminal stroke of said piston for cushioning the spent strokes of said piston, means including a spirally-rifled bar for rotating said piston step by step in one direction of its reciprocal movement, and means connected with said piston for rotating step by step said drill-bit-holding chuck, substantially as described.

13. In a rock-drilling engine the combination with the cylinder and the piston, of the front head, an axially-perforated cap removably secured to the end of said front cylinder-head, a drill-bit-holding chuck rotatably mounted in said front head, a rock-cutting drill-bit arranged and adapted to be instantly pushed into said chuck, and positioned to be struck by the said piston at each forward stroke of its reciprocal movement, means connected with said chuck and said drill-bit, including a partially-rotating ring, for releasably locking said drill-bit operatively in said chuck, and means connected with said chuck and piston for rotating said drill-bit step by step at substantially each reciprocal stroke of said piston, substantially as described.

14. In a rock-drilling engine the combination with the cylinder and the piston, of the back and supplementing cylinder-heads, the front cylinder-head, the pawl-controlled ratchet-toothed rifle-bar, provided with spiral flutes the water-regulating valve and passages through said supplementing cylinder-head, the water-conveying tube extending from said supplementing cylinder-head axially through said rifle-bar and said piston loosely, a drill-bit-holding chuck rotatably arranged in said front cylinder-head, a rock-cutting drill-bit provided with an axial bore and arranged and adapted to fit slidably in said chuck in a position to be struck by said piston by the forward strokes of said piston's reciprocal movement means, including a ring adapted to be moved rotatably a predetermined distance, for releasably locking said drill-bit to said chuck, and means including said rifle-bar and a rifled nut for rotating said drill-bit step by step at substantially each reciprocal movement of said piston, substantially as described.

15. In a rock-drilling engine the combination with the piston and the cylinder, of the rear cylinder-head and the supplementary cylinder-head, provided with a shouldered bearing, a ring mounted in said bearing, a copper-covered washer on each side of said ring, a thread at the end of said supplementary cylinder-head, and a hood threadedly arranged to clamp said ring and washers against said shouldered bearing of said head, substantially as described.

16. In a rock-drilling engine the combination with the cylinder and the piston, the rear cylinder-head and a supplementary cylinder-head having a rearward hub projecting, of a ring portion clampably secured to the supplementary cylinder-head, a circumferential groove in the inner periphery of said ring, a water-inlet member, arranged on said ring to intersect said circumferential groove of said ring, and provided with a hose connection at one end, and a valve at the opposite end adapted to control said water-inlet and said circumferential groove of said ring, axial slots in the hub of said supplementary cylinder-head, intersecting the circumferential groove in said ring, and an axial bore in said supplementary cylinder-head provided with a tapering portion a tapering sleeve adapted to fit said taper portion of the axial bore of said head, and extending beyond said head's hub end, a nut threaded to the end of said sleeve, and adapted to bear against said hub's end, an axial bore in said sleeve, a plurality of radial slots in the said tapering sleeve extending through its shell into its axial bore, a water-conveying tube fitting loosely in the bore of said tapering sleeve, and adapted to be clamped to said sleeve by said threaded nut at its end, and a hood secured over the end of the hub of said supplementary cylinder-head, arranged and adapted to form a closed water-passage from said axial groove in said hub to the end of said water-conveying tube, substantially as described.

17. In a rock-drilling engine the combination with the cylinder and the piston, of the rear cylinder-head and the water-inlet ring and tube

clampably secured to said supplementary head and provided with a curved hose connection at one end and a water-controlling valve at its opposite end, substantially as described.

18. In a rock-drilling engine, the combination with the cylinder and the piston, the rear and supplementary cylinder-heads, the valve-controlled water-inlet ring the hollow head on the end of said supplementary cylinder-head and the valve-controlled water-passage through said ring and head to said head, substantially as described.

19. In a rock-drilling engine the combination with the cylinder and the rear cylinder-heads, of the valve-controlled water-inlet ring, the hollow head, the axial tapering bore in said supplementary cylinder-head, the tapering split sleeve, provided with an axial bore and the water-conveying tube arranged and adapted to be releasably secured to said sleeve and to said supplementary cylinder-head, substantially as described.

20. In a rock-drilling engine, the combination with the cylinder, the piston and the rear and supplementary cylinder-heads, the piston and the pawl and ratchet ribs-bar mechanism, with a valve-controlled inlet member, secured to said supplementary cylinder-head, a head at the outer side end of said supplementary cylinder-head, suitable water-passages through said valve-controlled water-inlet member, and supplementary cylinder-head to said head, a water-conveying pipe projecting loosely through said ribs-bar and piston, and means including a clamping device for releasably securing said tube in operative relation to said water-inlet passages in said supplementary cylinder-heads.

709,023. STREET-SIGN-ILLUMINATING DEVICE. JOHN W. LIEB, Jr., and JOSEPH H. TYLER, New York, N. Y. Filed Jan. 10, 1902. Serial No. 88,110. (No model.)

Claim.—1. The combination with an electric-arc lamp and a non-illuminating resistance therefor, of an illuminating steadying resistance, and means for throwing either resistance into the lamp-circuit.

2. The combination with an electric-arc lamp and a non-illuminating steadying resistance, of an illuminating steadying resistance, and a switching device constructed to establish circuit through said non-illuminating resistance, then cut out said resistance and then cut in said illuminating resistance.

3. The combination of the arc-lamp 2, resistance 13, glow-lamps 7 means for throwing said resistance or said glow-lamps into the lamp-circuit and circuit connections substantially as set forth.

709,024. SIGN. JOHN LORENZ, Jr., Buffalo, N. Y. Filed Apr. 17, 1902. Serial No. 103,369. (No model.)

Claim.—1. In a sign of the class described, the combination with a casing having an open side, of an opaque closure slidably mounted upon the casing and covering a portion of the open side thereof, a transparent sign removably mounted upon the casing and covering the remainder of the open side of the same, and a lamp arranged within the casing behind the opaque closure.

2. In a sign of the class described, the combination with an open-sided casing having guideways in its edges contiguous to its open side, of an opaque closure slidable in the guideways and inclosing a part of the open side of the casing, a transparent sign also slidable in the guideways and covering the remainder of the open side of the casing, and a lamp arranged within the casing behind the opaque closure.

2. In a sign of the class described, the combination with an open-sided casing having guideways in its edges contiguous to its open side and extending from end to end thereof, of an opaque closure slidable in the guideways and closing a part of the open side of the casing, a transparent sign also slidable in the guideways and covering the remainder of the open side of the casing, said sign abutting against the end of the opaque closure, and a lamp arranged within the casing behind the opaque closure.

4. In a sign of the class described, the combination with an open-sided casing having guideways in its edges contiguous to its open side and extending from end to end, of an opaque closure slidable in the guideways and closing a part of the open side of the casing, said closure having a groove in one edge, a transparent sign also slidable in the guideways and covering the remainder of the open side of the casing, said sign fitting in the groove of the closure, and a lamp arranged within the casing behind the opaque closure.

5. In a sign of the class described, the combination with an open-sided casing comprising a wooden frame, a metal sheathing covering the frame and having inturned flanges located over and spaced from the edges of the frame to form guideways in the edges of the casing contiguous to its open side, a reflector arranged within the casing, a lamp mounted in front of the reflector, and a transparent sign slidably mounted in the guideways.

6. In a sign of the class described, the combination with an open-sided casing having grooves in its opposite edges contiguous to its open side, of a lamp arranged within the casing, a transparent sign slidably mounted within the grooves, and an opaque shield also slidably mounted in the grooves and interposed between the sign and the lamp.

7. In a sign of the class described, the combination with an open-sided casing having grooves in its opposite edges contiguous to its open side, of a lamp arranged within the casing, an opaque closure slidably mounted in the grooves and having a seat in one edge that aligns with the same, said closure being disposed in front of the lamp, a transparent sign also slidably mounted in the grooves and having one edge fitted in the seat of an opaque closure, and an opaque shield slidably mounted in the grooves in rear of the sign, said shield also having one edge fitted in the seat of the closure.

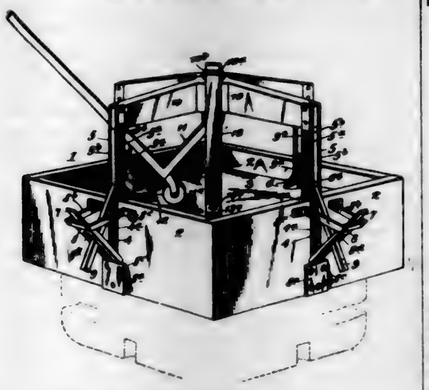
8. In a sign of the class described, the combination with a casing, of a concave reflector arranged within the casing and extending completely across the same, said reflector having outturned flanges at its side edges that overlap the edges of the casing, inturned flanges secured to the casing and spaced from the flanges of the reflector forming grooves, a sign slidably mounted in the grooves, and a lamp located within the casing.

9. In a sign of the class described, the combination with a wooden casing having an open side, of a reflector arranged within the casing and having its edges overlapping the edges of the open side of said casing, a sheathing covering the exterior of the casing and having its edges inturned over but spaced from the edges of the reflector, thereby forming grooves, a sign slidably mounted in the grooves, and a lamp located within the casing.

709,025. MACHINE FOR CUTTING RECESSES IN CONDUIT-SECTIONS. ROBERT W LYLE, Perth Amboy, N. J. Filed May 15, 1902. Serial No. 107,460. (No model.)

Claim.—1. A device of the class described, comprising a frame adapted to fit over the end of a conduit-section and around the upper portion of the sides thereof, means movably mounted in said frame for cutting recesses in such section, and means for operating such cutting means.

2. A device of the class described, comprising a frame constructed to fit the end of a conduit-section and extending down along the upper portion of the sides of such section to support the material of the section, cutting means for cutting recesses in the section and removing the cores cut from such recess, and means for operating such cutting means.



3. A device of the class described, comprising a frame for covering the end and upper portion of the sides of a conduit-section, a pair of knives movably mounted in said frame in timed relation to each other for simultaneously cutting a recess in such section longitudinally and transversely, and means for operating said knives.

4. A device of the class described, comprising a frame for covering the end and upper portion of the sides of a conduit-section, a pair of knives movably mounted in said frame in timed relation to each other for simultaneously cutting the sides and bottom of a recess in such section, and means for operating said knives.

5. A device of the class described, comprising a frame constructed to fit the end and upper portion of the sides of a conduit-section, a hollow knife movably mounted in said frame, and the interior of which is shaped like the cross-section of the desired recess, and the cutting edges of which are inclined at an angle desired for the bottom of such recess, and means for operating said knife.

6. A device of the class described, comprising a frame constructed to fit the end and overlap the upper portions of the sides of a conduit-section, a knife slidably mounted therein and inclined at the angle desired for the bottom of the recess in such section, and means for operating said knife.

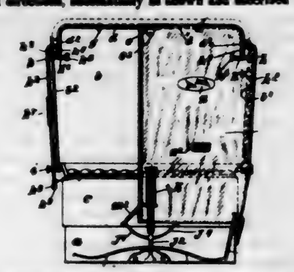
7. A device of the class described, comprising a frame for covering the end and upper portion of the sides of a conduit-section, a hollow knife movably mounted in said frame and the interior of which is shaped like the cross-section of the desired recess and the cutting edges of which are inclined at the angle desired for the bottom of such recess, a knife slidably mounted in the frame and inclined at the angle desired for the bottom of the recess in such section, and means for operating said knives.

8. A device of the class described, comprising a frame provided with a top and sides depending therefrom, and adapted to overlap the sides of a conduit-section, and having recesses with grooved side walls extending from the top of such sides toward the bottom, carriers sliding in such recesses, cutting knives secured to said carriers for cutting recesses in such sections, and means for raising and lowering said carriers.

709,026. STORM-CURTAIN FOR BUGGIES. BERNARD S. D. S. MARTIN, McPherson, Kans. Filed Feb. 18, 1902. Serial No. 94,707. (No model.)

Claim.—1. The herein-described supports for a storm-curtain of a buggy comprising rotatable rods detachably connected with the front of the top of the hood of a buggy and provided with downwardly-directed end members, side rods provided at their upper ends with inwardly-directed members pivotally connected with the end members of the rotatable rod and means for pivotally connecting the side rods with side members of the buggy-hood, said side rods being also provided at their lower end with notches or recesses and hooks pivotally connected therewith, substantially as shown and described.

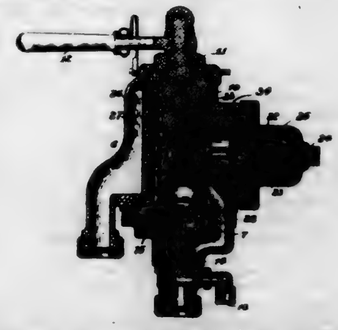
2. The herein-described supports for a storm-curtain of a buggy comprising rotatable rods detachably connected with the front of the top of the hood of a buggy and provided with downwardly-directed end members, side rods provided at their upper ends with inwardly-directed members pivotally connected with the end members of the rotatable rods, means for pivotally connecting the side rods with the side members of the buggy-hood, said side rods being also provided at their lower end with notches or recesses and hooks pivotally connected therewith, and spring-arms secured to the front of the body of the buggy and extending laterally in both directions, substantially as shown and described



3. A storm-curtain for buggies consisting of two separate similar parts and means connecting the same with the hood of a buggy, comprising rotatable rods *d* detachably connected with the top of the hood of the buggy, and provided with downwardly-curved end members, side rods *h* provided at their upper ends with inwardly-directed members pivotally connected with the end members of the rods *d* and with means for connecting them with the side members at their buggy-hood, said side rods being also provided at their lower ends with notches or recesses and with pivoted hooks, substantially as shown and described.

4. A storm-curtain for buggies consisting of two separate similar parts and means for connecting the same with the hood of the buggy, comprising rotatable rods *d* detachably connected with the top of the hood of the buggy, and provided with downwardly-curved end members, side rods *h* pivotally connected with the end members of the rods *d* and with means for connecting them with the side members of the buggy-hood, said side rods being also provided at their lower end with notches or recesses and with pivoted hooks, and the front of the buggy being also provided with laterally-directed spring-arms and said separate parts of the storm-curtain being provided with attaching-springs which are adapted to be connected with said arms and with the side of the body of the buggy, substantially as shown and described.

709,027. ENGINEER'S BRAKE-VALVE. HARRY R. MASON, Chicago, Ill., assignor to the Westinghouse Air Brake Company, Pittsburg, Pa., a Corporation of Pennsylvania. Filed Dec. 24, 1901. Serial No. 87,508. (No model.)



Claim.—1. An engineer's brake-valve having connection from a main reservoir and to a train-pipe, a main controlling-valve, a train-pipe-service discharge-port, a valve controlling said port, a piston arranged to produce gradual closure of said valve in service applications of the brakes, a passage for establishing communication between the fluid-pressures on opposite sides of said piston, a valvular device for controlling said passage, and power mechanism for actuating said valvular device, substantially as described.

2. An engineer's brake-valve having connection from a main reservoir and to a train-pipe, a main controlling-valve, a train-pipe-service discharge-port, a valve controlling said port, a piston arranged to produce gradual closure of said valve in service applications of the brakes, a passage for establishing communication between the fluid-pressures on oppo-

site sides of said piston, a valvular device for controlling said passage and a movable abutment for actuating said valvular device, substantially as described.

3. An engineer's brake-valve having connection from a main reservoir and to a train-pipe, a main controlling-valve, a train-pipe-service discharge-port, a valve controlling said port, a piston arranged to produce gradual closure of said valve in service applications of the brakes, a passage for establishing communication between the fluid-pressures on opposite sides of said piston, a valvular device for controlling said passage, and a piston for actuating said valvular device; substantially as described.

4. An engineer's brake-valve having connection from a main reservoir and to a train-pipe, a main controlling-valve, a train-pipe-service discharge-port, a valve controlling said port, a piston arranged to produce gradual closure of said valve in service applications of the brakes, a passage for establishing communication between the fluid-pressures on opposite sides of said piston, a valvular device for controlling said passage, a piston for actuating said valvular device, and means for establishing or destroying equilibrium of air-pressures on opposite sides of said piston, substantially as described.

5. An engineer's brake-valve having connection from a main reservoir and to a train-pipe, a main controlling-valve, a train-pipe-service discharge-port, a valve controlling said port, a piston arranged to produce gradual closure of said valve in service applications of the brakes, a passage for establishing communication between the fluid-pressures on opposite sides of said piston, a valvular device for controlling said passage, a piston for actuating said valvular device, means for establishing or destroying equilibrium of air-pressures on opposite sides of said piston, and a spring coöperating in the movement of said last-named piston, substantially as described.

709,028. PLOW. JOHN P. HELBERT, Pima, Wash. Filed Jan. 23, 1902. Serial No. 90,889. (No model.)

Claim.—1. In a plow, the combination with a plate-like standard and a beam thereon, of a cutter-disk held on the bottom of the standard and forming the share of the plow.

2. In a plow, the combination with a plate-metal standard and an adjustable beam thereon, of a cutter-disk held to rotate on the bottom of the standard and forming the share of the plow, and a cutter-disk on the beam, providing a colter for said plow.

3. In a plow, the combination with a plate-metal standard and an adjustable beam thereon, of a tapered point at the front of the standard, a base-plate held on and spaced from the lower edge of the standard, and a cutter-disk pivoted centrally between the standard and base-plate.

4. In a plow, the combination with a plate-metal standard having a lunate form, the straight edge being at the bottom, a tapered point T-shaped in cross-section, and an adjustable beam extended from the front of the standard, of a base-plate secured on the point and standard, extending rearward and spaced from the lower edge of the said standard, and a cutter-disk centrally pivoted between the base-plate and lower edge of the standard and forming the share of the plow.

5. In a plow, the combination with a standard having lunate form, a beam pivoted at one end at the front of the standard, an arm secured to project forwardly from the standard behind the beam, and an adjustable link-rod engaging the beam and arm, the adjustment of the said rod controlling the elevation or depression of the front end of the standard, of a point on the standard below the beam, and a horizontal cutter-disk held to rotate at the lower edge of the standard.

6. In a plow, the combination with a standard, and a beam extended forwardly therefrom, of a tapered point on the standard below the beam, a horizontal cutter in disk form pivoted at the lower edge of the standard, and means for supporting the moldboard inclined rearward and upward from the standard.

7. In a plow, the combination with a standard and a beam extended forwardly therefrom, of a tapered point on the standard below the beam, a base-plate held on the point and standard and spaced from the lower edge of said standard, a cutter in disk form pivoted between the base-plate and lower edge of the standard, a flat moldboard pivoted on the standard and inclined upwardly and rearwardly therefrom, and means for adjusting the inclination of the moldboard.

8. In a plow, the combination with a plate-metal standard having lunate form, a two-part beam pivoted thereon and extended forwardly, means for adjustably supporting the beam near its front end, and a disk cutter pivoted between members of the beam, of a tapered point on the standard, a base-plate secured on the point and standard, a disk cutter held to rotate between the base-plate and standard, a flat moldboard held to rock on and incline rearwardly and upwardly from the standard, a transverse shaft supported on the moldboard near its upper edge, and a plurality of disk cutters carried by the shaft.

9. In a plow, the combination with a plate-metal standard having lunate form, a beam extended forwardly from the standard, a point on said standard below the beam, and a disk cutter held to rotate in a horizontal plane at the lower edge of the standard, of a plate-metal moldboard having flat sides, means for holding the moldboard free to rock on the standard and inclined upwardly and rearwardly therefrom, a pawl on the moldboard engaging rack-teeth on the standard, a transverse shaft on the upper part of said moldboard, a plurality of disk cutters rotatable on the shaft in slots in the moldboard, and a plurality of pulverizing-arms held to rock on said shaft at the sides of the respective disk cutters.

10. In a plow of the character described, the combination with the plate-metal standard having lunate form, and having a series of teeth at its rear edge, of a moldboard rockably supported on the standard, and a pawl hung from the moldboard and adapted to mesh with the rack-teeth to change the inclination of the moldboard on the standard.

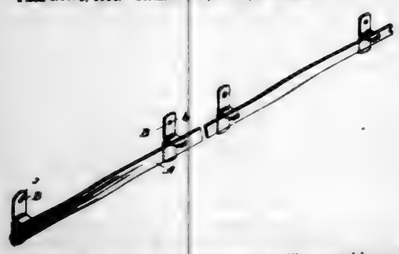
11. In a plow of the character described, the combination with a plate-metal standard, a beam thereon, a tapered point at the lower end of the beam, a horizontal disk cutter pivoted at the lower edge of the standard, and an inclinable flat moldboard projected upward and rearward from the standard, of a shaft carried by the moldboard near its upper edge, said moldboard having slots downwardly extended from the shaft, a series of disk cutters hung on the shaft and entering said slots, and a series of pulverizer-arms hung at one end on said shaft and thence extended rearward and downward, said arms having teeth on their upper edges and feet on their lower ends.

12. In a plow, the following coacting elements: a plate-metal standard, a tapering point thereon, a pivoted and vertically-adjustable beam, a disk cutter pivoted on the beam in a vertical plane, a horizontal disk cutter at the lower edge of the standard, a flat moldboard rockable transversely on the standard and extended rearwardly therefrom, a ratchet-and-pawl device for the inclined adjustment of the moldboard on the standard, a shaft carried at the upper edge of the moldboard, a series of cutter disks mounted on the shaft and working in slots in the moldboard, and a series of pulverizing-arms alternating with the disks on the shaft, said arms extending rearward and downward and each having a widened foot adapted to slide over the ground.

13. In a plow, the combination with a plate-metal standard and a two-part beam thereon, of a disk cutter pivoted between the members of the beam, serving as a colter for the plow.

14. In a plow, the combination with a plate-metal standard, of a two-part beam, a disk cutter pivoted between the members of the beam, a tapered point on the standard, and a horizontal disk cutter pivoted at the lower edge of the standard.

709,029. TRACK FOR DOOR-HANGERS. PHILIP A. MYERS, Ashland, Ohio, assignor to F. B. Myers and Bro., Ashland, Ohio, a Firm. Filed Nov. 9, 1901. Serial No. 81,774. (No model.)

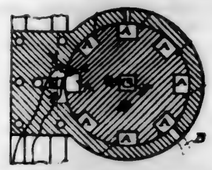


Claim.—1. A track for door-hangers and the like, comprising a plain metal bar and supporting-brackets, said brackets each comprising two members having adjoining ends passing through openings in the track and secured thereto, substantially as described.

2. A track for door-hangers and the like comprising a plain metal bar, supporting-brackets consisting of two angle-irons placed back to back with their ends passing through an opening centrally of the track and secured thereto, the brackets and track being symmetrically arranged so as to be reversible, substantially as described.

709,030. COMBINATION AIR AND VAPOR MOTOR. ALEXANDER MCGADDY, St. Joseph, Mo. Filed Aug. 27, 1900. Serial No. 28,158. (No model.)

Claim.—1. The combination in a motor of a vapor-chamber, and the plungers and plunger-guide therein, of a square vertical shaft, of the friction-wheel carried on the bottom thereof, of the main axle and the hub keyed thereto and adapted to contact with said friction-wheel, of a horizontal disk carried by said shaft through a square opening in the center of said disk enlarged at both top and bottom, of the disk-pockets, an aperture leading into the vapor-chamber and with which the disk-pockets are arranged to successively register during the motion of said disk, of the wires thereon, of the spring arranged to contact therewith, of the pipe connection between said pockets and the gasolene-tank which pipe is provided with any suitable means for heating and generating the gas therein, and the means through which to transmit the pressure caused by the explosions into the vapor-chamber from said disk-pockets as each pocket registers with the aperture provided, substantially as described and shown.



2. The combination with a gasolene-tank, a square shaft, of a disk, rotated thereby, of the pockets thereon and their copper wires, of a pipe attached to said tank and connecting with the passage into said pockets, of the hub and its axle and the vapor-chambers surrounding the same, of the plungers and their springs and the channels through which said plungers are let into said hub, of the plunger-guide, of the surrounding rim, of the opening through said rim to permit the pressure caused by the explosions in said pockets to enter said vapor-chamber, of the copper plates connected with said disk-pockets, of the spring, of the copper wire adapted to form connection between said spring and a storage battery and of the wire connecting with said plate and adapted to make complete circuit with the storage battery when the disk-pocket wire is brought into contact with said plate and secure explosion, substantially as described and for the purpose specified.

3. The combination with a gasolene-tank and its connecting-pipe of a disk rotated by a square vertical shaft, of the gas-pockets on said disk, of the disk-pocket wires, of the copper plate, of the spring and the connecting-wires to make complete circuit with a storage battery and cause explosions of gas as the pockets revolve, of an inclosed circular vapor-chamber, of the hub through the center thereof, of the plungers and the spring ends thereof let into said hub, of the elastic bumpers on said plungers, of the plunger-guide, of the means through which power is transmitted from the disk-pockets after explosions of the gas into said vapor-chamber, of a square vertical shaft, of a friction-wheel carried horizontally at the lower end thereof, of a lever connected at one end with the upper end of said shaft and of a safety-valve and its plunger having connection with the other end of said lever, and of the air-escapes, all substantially as described.

709,031. NON-REFILLABLE BOTTLE. RALPH MCCORD, St. Louis, Mo. Filed Jan. 2, 1902. Serial No. 88,162. (No model.)

Claim.—1. In a non-refillable bottle, the combination with the bottle-neck having an internal annular groove formed therein, of a stopper having longitudinal communicating chambers, transverse apertures leading from said chambers, a detachable valve-seat, a valve mounted in one of the chambers, and an expansible locking-band to hold the stopper in the bottle, substantially as specified.

2. In a non-refillable bottle, the combination with a bottle-neck having an annular groove, of a stopper carrying an expansible locking-band to engage the annular groove, said stopper having longitudinal communicating chambers and transverse discharge-apertures, a valve playing in one of the chambers, means to limit the movement of the valve, a detachable valve-seat, and means to permit a free circulation of air around and into the stopper when the contents are being poured from the bottle.

3. In a non-refillable bottle, the combination with the bottle-neck having an annular groove formed therein, of a stopper provided with a longitudinal eccentric, truncated, cylindrical chamber, and a ball-valve operating in the said chamber, a longitudinal segmental chamber communicating with the cylindrical chamber, and having an air-vent leading therein, transverse discharge-apertures leading from each of the chambers, a detachable valve-seat, and means to engage the annular groove to hold the stopper in a bottle-neck.

4. As an article of manufacture, the combination with the bottle-neck having an annular groove, of a stopper having an annular flange at its top provided with a flattened face, a recess beneath the annular flange, longitudinal chambers formed in the stopper and communicating with transverse discharge-apertures, a valve in one of the chambers, a valve-seat fitted on the lower end of the stopper, and a packing encircling the side of said valve-seat, means to prevent displacement of the valve-seat and the packing, and an expansible locking-band bent in semi-circular form having overlapping ends which fit within the recess beneath the annular flange, said locking-band adapted to expand and engage the annular groove in the bottle-neck, substantially as and for the purpose set forth.

709,032. STEAM-BOILER. CHARLES OLSON, Grand Rapids, Mich. Filed Mar. 28, 1902. Serial No. 100,061. (No model.)

Claim.—1. In a boiler, the combination of a tubular shell, an annular cap detachably secured thereto, removable heads and flues, a gasket, a ring engaging the gasket, and set-screws in the cap engaging the ring, substantially as described.

2. In a boiler, the combination of a plain tubular shell externally threaded at each end, annular internally-threaded caps having large central openings, set-screws at regular intervals in the caps, removable heads in the boiler, flues connecting the heads and attached thereto, a gasket covering the seam between the heads and shell, rings engaging the gasket and engaged by the set-screws, substantially as described.

3. The combination of a tubular shell, annular caps detachably secured thereto, set-screws at intervals in the caps, removable heads within the shell, flues connecting the heads and attached thereto, the outer flues being arranged in a circle and equidistant from the peripheries of the heads, gaskets covering the seam between the heads and shell, and rings engaging the gaskets and engaged by the set-screws, substantially as described.

4. In a boiler, the combination of a plain tubular shell externally threaded at the ends, internally-threaded caps having large central openings, set-screws at regular intervals in the caps, removable heads in the shell, flues connecting the heads, and arranged in a circle equidistant from the peripheries of the heads, gaskets covering the seams between the heads and shell, and yielding rings engaging the gaskets and engaged by the screws, substantially as described.

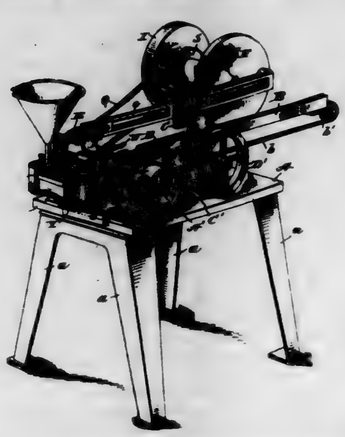
709,033. BOX-SANDING MACHINE. CHARLES H. PALMER and JOHN W. DUNBAR, Akron, Ohio, assignors to the Diamond Match Company, Chicago, Ill., a Corporation of Illinois. Filed Jan. 9, 1902. Serial No. 88,8. (No model.)

Claim.—1. In a sanding-machine, the combination of sanding mechanism, a reciprocating bar by which box parts are conveyed to the latter, and means for feeding box parts in a path crosswise of said bar, in position for the end of the latter to enter therein, substantially as and for the purpose described.

2. In a sanding-machine, the combination of sanding mechanism, and a reciprocating bar adapted to enter and engage a box part and carry it to the sanding mechanism, substantially as and for the purpose described.

3. In a sanding-machine, the combination of sanding mechanism, a reciprocating bar adapted to enter and engage a box part and carry it to

the sanding mechanism, and means for feeding box parts into the path of the bar, substantially as and for the purpose described.



4. In a sanding-machine, the combination of sanding mechanism, a reciprocating bar adapted to enter and engage a box part and carry it to the sanding mechanism, a source of supply of box parts, and means for feeding them from said source of supply into the path of the bar, substantially as and for the purpose described.

5. In a sanding-machine, the combination of sanding mechanism, a box-part carrier for conveying box parts to the latter, a box-part guide alongside the path of said carrier, and means for passing box parts from the guide to the carrier, substantially as and for the purpose described.

6. In a sanding-machine, the combination of sanding mechanism, a reciprocating bar adapted to receive and convey box parts to said mechanism, a box-part guide alongside the path of the bar, and means for passing box parts from the guide into the path of the carrier, substantially as and for the purpose described.

7. In a sanding-machine, the combination of sanding mechanism, a reciprocating bar adapted to receive and convey box parts to said mechanism, a trough-form, box-part guide alongside the path of said bar, and means for passing box parts from the guide into the path of the bar, substantially as and for the purpose described.

8. In a sanding-machine, the combination of sanding mechanism, a reciprocating bar adapted to receive and convey box parts to said mechanism, a trough-form, box-part guide alongside the path of said bar, and a box-part carrier that is movable crosswise of said guide, substantially as and for the purpose described.

9. In a sanding-machine, the combination of sanding mechanism, a reciprocating bar adapted to receive and convey box parts to said mechanism, a trough-form, box-part guide alongside the path of said bar, a conveyor at the bottom of the guide, and means for passing box parts from the guide into the path of the bar, substantially as and for the purpose described.

10. In a sanding-machine, the combination of sanding mechanism, a reciprocating bar adapted to receive and convey box parts to said mechanism, and a yielding device adjacent to the path of the bar and adapted to engage a box part carried thereby, substantially as and for the purpose described.

11. In a sanding-machine, the combination of sanding mechanism, a reciprocating box-part-carrier bar, a trough with an open bottom, in line with said bar, and a spring adjacent to the path of the bar in position to engage a box part thereon, substantially as and for the purpose described.

12. In a sanding-machine, the combination of sanding mechanism, a box-part carrier, a box-part guide, and a second box-part carrier movable between the guide and the first carrier, substantially as and for the purpose described.

13. In a sanding-machine, the combination of sanding mechanism, a box-part-carrying bar, means for reciprocating the same, a trough-form box-part guide parallel with the path of said bar, a box-part carrier movable in a path that is crosswise of that of the bar, a trough-form guide into which the bar moves the box part, a spring to press against the box part when on the bar, and a device to remove the box part from said bar, substantially as and for the purpose described.

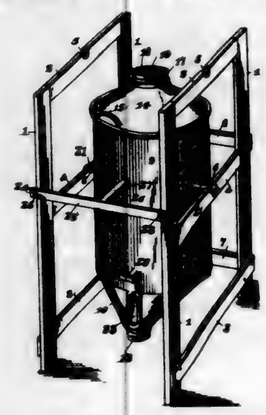
709,084. PAPER-MAKING WIRE FOR PAPER-MAKING MACHINES. HOWARD PARKER, Bellows Falls, Vt. Filed Mar. 29, 1901. Serial No. 53,534. (No model.)

Claim.—1. A paper-making wire for paper-making machines comprising a perforated metallic plate with a surface having an affinity for rubber, and the coating of rubber united in and by vulcanization to said metallic plate.

2. A paper-making wire for paper-making machines comprising a metallic plate having a surface which has an affinity for rubber, and the coating of rubber united in and by vulcanization to said metallic plate and extending through the perforations therein, all substantially as described.

3. A paper-making wire for paper-making machines comprising the plate of perforated metal, the plating of lead on said plate, and the coating of rubber united in and by vulcanization to the coating of lead and extending through the perforations in said plate of perforated metal, all substantially as described.

709,085. CREAM-SEPARATOR. CLARENCE W. PARKS, Lowell, Mich. Filed Sept. 20, 1901. Serial No. 75,755. (No model.)



Claim.—1. In a device of the character described, the combination with a crate or stand having upper and lower seats, of a receptacle constructed to be interchangeably supported by the seats of the stand, and a single locking device engaging the receptacle while supported in either of the seats for holding the receptacle in an upright position.

2. In a device of the character described, the combination with a crate or stand having corresponding upper and intermediate cross-bars provided with corresponding seats, of a receptacle to fit within the stand and having opposite outwardly-directed projections to interchangeably fit the respective seats, and a locking device carried by the standard and engaging the receptacle in both of its positions for holding the same in an upright position.

3. In a device of the character described, the combination with a stand or support, of a creaming-can pivotally carried thereby and provided with a keeper, a locking device pivoted to one side of the frame and having its free end provided with a catch, a keeper upon the frame and located in the path of the catch to hold the locking device against accidental movement, and a laterally-projected catch carried by an intermediate portion of the locking device and disposed for engagement with the keeper of the can to prevent accidental swinging thereof.

4. In a device of the character described, the combination with a supporting stand or frame, of a creaming-can pivotally carried thereby and provided with a keeper, and a swinging cross-bar pivotally connected to one side of the frame and having a detachable connection with the opposite side thereof, the intermediate portion of the cross-bar being provided with a hook or catch for detachable engagement with the keeper of the can.

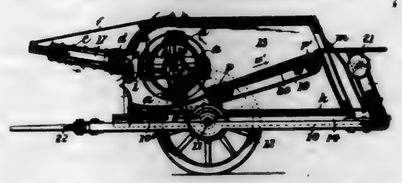
5. In a device of the character described, the combination with a stand or supporting-frame comprising corner-uprights and cross-bars, of a creaming-can pivotally supported within the frame, and a cross-bar pivotally connected to one of the uprights and having a detachable hooked connection with the opposite upright, the intermediate portion of the cross-bar being provided with a hook or catch to engage the can and hold it against accidental swinging movements.

6. The combination of a supporting-frame having an open front, an open top and an open upper back portion, pairs of upper and lower bearings, a vertically-disposed receptacle of less length than the frame and having normally closed top and bottom openings, and opposite outwardly-directed bearing projections normally seated in the lower pair of bearings of the frame and capable of being interchanged from one pair of bearings to the other, the receptacle also being capable of being inverted upon its pivots when seated in the upper pair of bearings to rest its lower end upon the back of the frame.

7. The combination of a supporting-frame having an open front, an open top and an open upper back portion, pairs of upper and lower bearings, a vertically-disposed receptacle of less length than the frame and having normally closed top and bottom openings, and opposite outwardly-directed bearing projections located above the middle of the receptacle, normally seated in the lower pair of bearings of the frame and capable of being interchanged from one pair of bearings to the other pair, the receptacle also being capable of being inverted upon its pivots when seated in the upper pair of bearings to rest its lower end upon the back of the frame, a keeper upon the lower front side of the receptacle, a cross-bar pivoted to one side of the upper front of the frame and having a detachable connection with the opposite side of the front, and a lateral inwardly-directed hook rigidly carried by the cross-bar and capable of engaging the keeper to hold the receptacle against accidental movement when supported in the upper pairs of bearings.

8. A combined shipping-crate and stand, comprising four corner-uprights, upper, lower and intermediate cross-bars connecting corresponding front and rear uprights, a bottom and an intermediate cross-bar connecting the rear uprights, the space between the rear uprights above the intermediate cross-bar being open, the opposite intermediate and top cross-bars being provided in their upper edges with corresponding notches, and a single cross-bar connecting the front uprights and having one end pivotally connected to one of said uprights, the opposite free end of the cross-bar having a hooked connection with the other upright, and the intermediate portion of the cross-bar having a laterally-projected hook.

709,086. SEED-GATHERER. JOSIAH PRICE, Nicholasville, Ky. Filed Oct. 30, 1901. Serial No. 80,594. (No model.)



Claim.—1. A seed-gatherer, comprising a movable main frame, a spring-controlled rockable body thereon, a rotatable stripping-cylinder in the body, and a comb at the front of the stripping-cylinder.

2. A seed-gatherer, comprising a movable main frame, a body adapted to rock thereon, a rotatable stripping-cylinder having series of spaced teeth thereon, and a spring-controlled comb at the front of the stripping-cylinder.

3. A seed-gatherer, comprising a wheeled main frame, a body adapted to rock therein, a stripping-cylinder having series of teeth diagonally disposed on the periphery thereof, an upright comb mounted on a cross-bar, said bar being spring-cushioned and adapted to slide on the bottom frame of the body, and an apron adjustable above and forward of the comb.

4. A seed-gatherer, comprising a main frame, a transverse axle, wheels thereon, a body rockable on said axle, a rotatable stripping-cylinder in the body, a slidable spring-cushioned comb on a cross-bar at the front of the stripping-cylinder, an endless apron having spaced ribs thereon and adjustably supported on the body above the comb, an endless apron in the body behind the stripping-cylinder, and means to drive the cylinder and both aprons.

5. A seed-gatherer, comprising a wheeled main frame, a spring-controlled tilting body therein, a rotatable toothed cylinder in the body and a stripping-comb at the front of the body adjacent the cylinder.

6. A seed-gatherer, comprising a wheeled main frame, a spring-controlled tilting body therein, a rotatable toothed cylinder, a stripping-comb adjacent the cylinder, and adjustable means forward of the comb to cause engagement therewith of the grain or grain.

709,087. TREATMENT OF TELLURIDE GOLD ORES. WALTER PETTYBRIDGE, London, England. Filed Aug. 19, 1901. Serial No. 72,069. (No specimens.)

Claim.—1. A process for the decomposition of ores containing telluride of gold, consisting in reducing the ore to a finely-divided state, then exposing the ore to the action of a solution of ferric chlorid of a specific density of about 1.16, and continuing the treatment until the tellurium is in solution.

2. In the decomposition of ores containing telluride of gold, the process of reducing the ore to a finely-divided state and then exposing the ore to the action of a solution of ferric chlorid, alone, to attack the tellurium.

3. In the decomposition of ores containing telluride of gold, the process of reducing the ore to a finely-divided state and then exposing the ore to the action of a heated and agitated solution of ferric chlorid, alone, to attack the tellurium.

4. In the decomposition of ores containing telluride of gold together with iron, the process of reducing the ore to a finely-divided state, treating the ore with hydrochloric acid and water to form ferric chlorid in solution, and then decomposing the telluride of gold by means of such ferric chlorid.

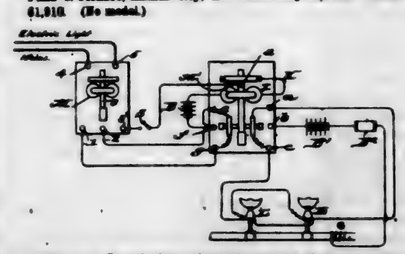
709,088. PROCESS OF TREATING TELLURIDE GOLD ORES. WALTER PETTYBRIDGE, London, England. Filed Sept. 23, 1901. Serial No. 76,267. (No specimens.)

Claim.—1. A process for the decomposition of telluride of gold contained in ores, consisting in pulverizing the ore and treating the pulverized ore with a solution of ferric sulfate, used alone, resulting in the dissolving of the tellurium and the freeing of the gold in a solid form, substantially as described.

2. A process for the decomposition of telluride of gold contained in ores, consisting in pulverizing the ore and treating the pulverized ore with a solution of ferric sulfate, used alone, the separation of the filtrate, the precipitation of the tellurium by metallic iron and boiling, and the reconversion of the spent filtrate of ferrous sulfate into ferric sulfate by the action of potassium chlorate.

3. A process for the recovery of gold and tellurium from telluride of gold contained in ores, consisting in treating the pulverized ore with a solution of ferric sulfate, used alone; separating the filtrate from the solid residue; treating the residue for recovery of the free and solid gold therein, treating the filtrate for precipitation of the tellurium by metallic iron and boiling, separating the further filtrate of ferrous sulfate, and converting the ferrous sulfate into ferric sulfate by oxidation.

709,089. COMBINED ELECTRIC AND GAS LIGHTING SYSTEM. FRED G. PICKERT, Kansas City, Mo. Filed May 28, 1901. Serial No. 61,910. (No model.)



Claim.—1. In a device of the kind described, the combination with an initial circuit-closer, of a secondary circuit-closer, a battery arranged between the initial and the secondary circuit-closers, a commutator arranged adjacent to the secondary circuit-closer and operated by the vibration of the armature of the said secondary circuit-closer, a sparking coil connected with the automatic lighting and extinguishing device, said sparking coil being also connected with the commutator of the secondary circuit-closer, and a battery interposed between said commutator and sparking coil, substantially as shown and described.

2. In a device of the kind described, the combination with a primary circuit-closer, of a secondary circuit-closer having a vibrating armature, a double commutator arranged in connection with the secondary circuit-closer, a battery arranged between the primary and secondary circuit-closers, and a battery and sparking coil connected with the secondary closer, substantially as described.

3. In a device of the kind described, the combination with a secondary circuit-closer, having a vibrating armature, of the pawl attached thereto, the ratchet-wheel operated by the said pawl, the commutator-

disks arranged upon the ratchet-wheel shaft, and the brushes arranged in connection with the said commutator-disks and the battery and sparking coil arranged in connection with the said commutator-disks, substantially as and for the purpose described.

709,040. RAILWAY-SIGNAL. JONATHAN D. PEER, AURORA, Ill., assignor to Miller Signal Company, Chicago, Ill., a Corporation of Illinois. Filed Mar. 21, 1901. Serial No. 52,222. (No model.)

Claim.—1. The combination of a railroad-track electrically divided into blocks and having insulated track-rail sections, a signal-controlling electric generator connected with two sections located one in advance of the other to form therewith a local partial circuit, a pole-changer for said local partial circuit, said local partial circuit being normally closed so as to supply an impulse in one direction or the other to said rail-sections, depending upon the position of said pole-changer, means for operating said pole-changer, a train-carried electrically-controlled clear-signal, and track-engaging conductors for simultaneously engaging said last-named rail-sections to conduct the controlling-current to the train, substantially as and for the purpose set forth.

2. The combination of a railroad-track electrically divided into blocks and having relatively short insulated rail-sections at the block-junctions, the track being electrically continuous between said short sections, a signal-controlling electric generator connected with a relatively short section and an adjacent section, a pole-changer for the local partial circuit thus formed, the local partial circuit being normally closed to supply an impulse to the last-named rail-sections in one direction or the other, according to the position of the pole-changer, means for operating said pole-changer, a transient clear-signal, a transient electrically-controlled device controlling said signal, and conductors leading from said device and engaging the track one in advance of the other and serving normally to conduct current to said device when said last-named rail-sections are simultaneously engaged, substantially as and for the purpose set forth.

3. The combination of a railroad-track electrically divided into blocks and having insulated track-rail sections, a signal-controlling electric generator connected with two sections located one in advance of the other, a pole-changer for the local partial circuit thus formed, a controlling instrument for said pole-changer connected with both track-rails at the rear end of the block in advance of the block-junction with which said electric source is connected, a track-battery connected with the advance ends of both track-rails of said last-named block, a transient signal, an electrically-controlled transient device controlling said signal, and conductors leading from said device and located to simultaneously engage said last-named rail-sections, whereby a signal-controlling current is normally supplied to said device at the block-junction, substantially as and for the purpose set forth.

4. The combination of a railroad-track electrically divided into blocks and having insulated track-rail sections, a signal-controlling electric generator for each block-junction, and having connection with two rail-sections to form therewith a local partial circuit, a pole-changer for each local partial circuit, a controlling instrument for each pole-changer energized from the signal-controlling generator of the advance block-junction, and a transient signal mounted to traverse said track, and provided with conductors for simultaneously engaging said last-named two rail-sections, substantially as and for the purpose set forth.

5. The combination of a railroad-track electrically divided into blocks and having insulated track-rail sections, a signal-controlling electric generator for each block-junction, and having connection with two rail-sections to form therewith a local partial circuit, a pole-changer for each local partial circuit, a controlling instrument for each pole-changer having one conductor connected with the track at the rear end of the advance block and another conductor connected with the track at the advance block-junction, means for completing the circuit of said instrument through the signal-controlling generator of the advance block and through a section of the track, a switch in said last-named circuit, a switch-controlling instrument connected with both track-rails at the rear end of said last-named block, a track-battery connected with both track-rails at the advance end of said block, and a transient electrically-controlled signal mounted to traverse said track and provided with conductors for simultaneously engaging said last-named two rail-sections, substantially as described.

6. The combination of a track divided into blocks and having insulated rail-sections, a signal-controlling battery for each block connected with two rail-sections of one track-rail, a pole-changer for the local partial circuit thus formed at each block-junction, an instrument controlling each pole-changer and connected with the signal-controlling battery at the block-junction in advance thereof, a switch in the circuit of said last-named instrument, a switch-controlling instrument connected with both track-rails near the rear end of each block, a battery energizing each switch-controlling instrument and connected with both track-rails near the advance end of the block, and an electrically-controlled transient signal mounted to traverse said track and having track-engaging conductors located one in advance of the other, substantially as described.

7. The combination of a track divided into blocks and having insulated rail-sections, a signal-controlling battery for each block-junction having connections with rail-sections located one in advance of the other, a pole-changer for each local partial circuit thus formed, an instrument controlling each pole-changer and having a conductor connected with the track near the rear end of the block and a conductor leading to the signal-controlling battery of the block-junction in advance, switches interposed in the course of said last-named conductor near its rear and advance ends, switch-controlling instruments connected with both track-rails near the rear ends of the several blocks, switch-controlling batteries connected with both track-rails near the advance ends of the several blocks, and an electrically-controlled transient signal mounted to traverse said track and having track-engaging conductors located one in advance of the other, substantially as described.

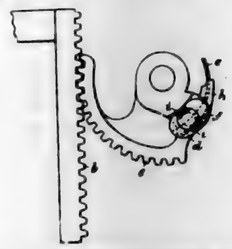
8. The combination of a track electrically divided into blocks, and having at each block-junction a relatively short rail-section, the track-rail between said relatively short sections being electrically continuous, signal-controlling batteries for the several block-junctions, each having connection with a relatively short section and with the advance end of the adjacent section in the rear thereof, a pole-changer for each local partial circuit thus formed, a controlling instrument for each pole-changer having a conductor connected with the rear end of the rail-section in advance of the corresponding relatively short section and another conductor connected with the circuit of the signal-controlling battery at the advance block-junction, a switch in the circuit of each pole-changer-controlling instrument, a switch-controlling instrument connected with both track-rails at the rear end of each block, a track-battery connected with both track-rails at the advance end of each block, and a transient electrically-controlled signal mounted to traverse said track, and provided with conductors for simultaneously engaging the two rail-sections of the local partial circuit, substantially as described.

9. The combination of a track electrically divided into blocks, one of the track-rails having at each block-junction a relatively short insulated rail-section, a signal-controlling battery for each block-junction connected with the corresponding short rail-section and with the advance end of the rear adjacent rail-section, a pole-changer for each local partial circuit thus formed, an instrument for automatically maintaining each local partial circuit in a closed condition to deliver a signal, transient signal mechanism mounted to traverse said track and comprising clear and danger signals, an electrically-controlled device controlling said signals, and conductors leading from said device and simultaneously engaging a relatively short rail-section and an adjacent rail-section when a block-junction is encountered, substantially as and for the purpose set forth.

10. The combination of a track divided into block-junctions and having insulated rail-sections, train-carried signal mechanism comprising a signal, an electrically-controlled device controlling said signal, said device including a magnet equipped with opposite windings, a conductor connected with one end of each of said windings and leading from said device to the track, two additional conductors connected with said windings at their opposite ends and leading from said device to the track and engaging the track, one in advance of and the other in the rear of said first-named track-engaging conductor, whereby the same signal will be given whether the current be conducted through the two advance track-engaging conductors or the two rear track-engaging conductors, substantially as described.

11. The combination of a track divided into block-junctions and having insulated rail-sections, train-carried signal mechanism comprising a signal, an electrically-controlled device controlling said signal, and supplied with permanent magnets, said device being equipped with opposite windings, a conductor connected with one end of each of said windings and leading from said device to the track, two additional conductors connected with the opposite ends of said windings and leading from said device to the track and engaging the track, one in advance of and the other in the rear of said first-named track-engaging conductor, whereby the same signal will be given whether the current be conducted through the two advance track-engaging conductors or the two rear track-engaging conductors, substantially as described.

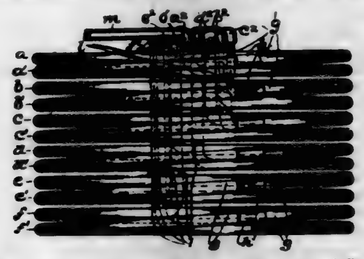
709,041. BOOT-STITCHING MACHINE. PERCY RANDALL and GEORGE DAVIS, Northampton, England. Filed Apr. 24, 1902. Serial No. 104,471. (No model.)



Claim.—1. In a rotary boot-stitching machine the combination of a curved awl, a segment to which it is attached, means for rotating the segment, an awl-cap attached to the segment for holding the awl in place and a pricker-blade fast with the cap.

2. In the rotary boot-stitching machine the combination of a curved awl, a segment to which it is attached, means for rotating the segment, an awl-cap for securing the awl to the segment and a curved pricker-blade formed with the cap and concentric with the awl.

709,042. STEAM-GENERATOR OR WATER-HEATER. CHARLES M. RAYMOND, Cleveland, Ohio, assignor of one-half to Louis R. Hoffman, Cleveland, Ohio. Filed Mar. 17, 1902. Serial No. 98,587. (No model.)



Claim.—1. A steam generator or heater of the character indicated, comprising pairs of helical pipe-sections arranged, respectively, in a horizontal or approximately horizontal plane and at short intervals vertically, which pipe system has the two sections of each pair of helical sections arranged one above the other and corresponding or approximately corresponding with each other in dimensions and number of coils and communicating with each other at their outermost coils and having their innermost coils provided, respectively, with an upward extension / projecting upwardly; a pipe arranged to conduct fluid from the pipe system and connected and communicating with the innermost coil of the upper section of the lowermost pair of helical pipe-sections, a fluid-supply pipe connected and communicating with the upward extension of the innermost coil of the lower section of the uppermost pair of helical pipe-sections, and a connection between the upward extension of the innermost coil of the lower section of each remaining pair of helical pipe-sections and the upward extension of the innermost coil of the upper section of the pair of helical pipe-sections next above, substantially as and for the purpose set forth.

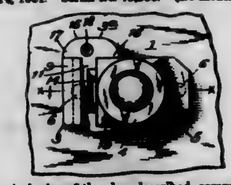
2. A steam generator or heater of the character indicated, comprising pairs of helical pipe-sections arranged, respectively, in a horizontal or approximately horizontal plane and at short intervals vertically and constituting a partial inclosure for a space or opening *k* arranged centrally of and extending from top to bottom of the said pipe system, which pipe system has the two sections of each pair of helical sections arranged one above the other and communicating with each other at their outermost coils and having their innermost coils provided, respectively, with an upward extension / projecting upwardly through the aforesaid opening or space; a pipe arranged to conduct fluid from the pipe system and connected and communicating with the innermost coil of the upward extension of the upper section of the lowermost pair of helical pipe-sections; a fluid-supply pipe connected and communicating with the upward extension of the innermost coil of the lower section of the uppermost pair of helical pipe-sections, and a connection between the upward extension of the innermost coil of the lowermost section of each remaining pair of helical pipe-section and the upward extension of the innermost coil of the upper section of the pair of helical pipe-sections next above, substantially as and for the purpose set forth.

3. A steam generator or heater of the character indicated, comprising pairs of helical pipe-sections arranged, respectively, in a horizontal or approximately horizontal plane and at short intervals vertically, which pipe system has the two sections of each pair of helical sections arranged one above the other and communicating with each other at their outermost coils and having their innermost coils provided, respectively, with an upward extension / projecting upwardly to and above the uppermost helical section; a pipe arranged to conduct fluid from the pipe system at the top of the pipe system and connected and communicating with the upward extension of the innermost coil of the upper section of the lowermost pair of helical pipe-sections; a fluid-supply pipe arranged to supply fluid to the pipe system at the top of the pipe system and connected and communicating with the upward extension of the innermost coil of the lower section of the uppermost pair of helical pipe-sections; and a pipe connection, above the uppermost helical pipe-section, between the upward extension of the innermost coil of the lowermost section of each remaining pair of helical pipe-sections and the upward extension of the innermost coil of the upper section of the pair of helical pipe-sections next above.

4. A steam generator or heater of the character indicated, comprising pairs of helical pipe-sections arranged, respectively, in a horizontal or approximately horizontal plane and at short intervals vertically and constituting a partial inclosure for a space or opening *k* formed centrally of and extending from top to bottom of the said pipe system, which pipe system has the two sections of each pair of helical sections arranged one above the other and communicating with each other at their outermost coils and having their innermost coils provided, respectively, with an upward extension / projecting upwardly within the aforesaid space or opening; a pipe arranged to conduct fluid from the pipe system and connected and communicating with the innermost coil of the upper section of the lowermost pair of helical pipe-sections; a fluid-supply pipe connected and communicating with the upward extension of the innermost coil of the lower section of the uppermost pair of helical pipe-sections, and a connection between the upward extension of the innermost coil of the lowermost section of each pair of helical pipe-sections, except the lower section of the uppermost pair of helical sections, and the upward extension of the innermost coil of the upper section of the pair of helical pipe-sections next above.

5. A steam generator or heater of the character indicated, comprising pairs of helical pipe-sections arranged, respectively, in a horizontal or approximately horizontal plane and at short intervals vertically, which pipe system has the outermost coils of the two sections of each pair of helical sections joined together by a union; a pipe arranged to conduct fluid from the pipe system and connected and communicating with the innermost coil of the upper section of the lowermost pair of helical pipe-sections; a fluid-supply pipe connected and communicating with the innermost coil of the lower section of the uppermost pair of helical pipe-sections, and a connection between the innermost coil of the lowermost section of each pair of helical pipe-sections, except the lower section of the uppermost pair of sections, and the innermost coil of the upper section of the pair of helical pipe-sections next above.

709,048. NUT-LOCK. GEORGE H. ROSSER, Sr., New York, N. Y. Filed Sept. 14, 1901. Serial No. 75,266. (No model.)



Claim.—1. A device of the class described, comprising a base-plate provided with means to prevent the rotation thereof and at one side of its upper surface with an upwardly-projecting rib having at the top thereof an inwardly-extending shoulder and a locking device fitting under said shoulder and against said rib and pressing against the nut and provided with a head bearing on one side against one face of the base-plate and on the other side against one face of the nut and with the end portion adapted to be bent into engagement with another face of the nut.

2. A device of the class described, comprising a base-plate provided with means to prevent the rotation thereof and at one side of its upper surface with an upwardly-projecting rib having at the top thereof an inwardly-projecting shoulder and a locking device fitting under said shoulder and against said rib and between the nut and base-plate and provided with a shoulder bearing against the nut and with a head projecting from opposite sides of said device and bearing against the base-plate and nut and with an end portion bent into engagement with another face of the nut.

709,044. MECHANISM FOR TRIMMING MANTLES. JAMES T. ROSIE, New York, N. Y. Filed Dec. 23, 1901. Serial No. 87,634. (No model.)

Claim.—1. In a mechanism for trimming mantles, the combination with a vertically-arranged mandrel over which the mantle fits, and the wall of which mandrel serves as a support for the lower portion of the wall of the mantle, a knife for trimming the mantle, and means for rotating one of said parts in contact with the other.

2. In a mechanism for trimming mantles, the combination with a mandrel over which the mantle fits, and the wall of which mandrel serves as a support for the lower portion of the wall of the mantle, an adjustable part carried by the mandrel, a knife for trimming the mantle, and means for rotating one of said parts in contact with the other.

3. The combination in a mechanism for trimming mantles, of a mandrel for supporting a mantle, means for causing a rotation of the mandrel in one direction, and other means for causing a rotation of the mandrel in a reverse direction, and a knife adapted to coact with the mandrel to trim the mantle supported thereby.

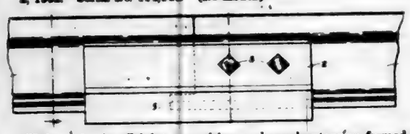
4. The combination in a mechanism for trimming mantles, of a mandrel for supporting a mantle, a cord coiled about the mandrel for causing a rotation of the mandrel in one direction, a weight connected to the cord and adapted when the cord is released for rotating the mandrel in a reverse direction, and a knife adapted to coact with said mandrel for trimming the mantle supported thereby

5. The combination in a mechanism for trimming mantles of a mandrel for supporting a mantle and adjustable extension on said mandrel, and a knife adapted to coact with said mandrel to trim the mantle supported thereby.

6. The combination in a mechanism for trimming mantles, of a rotatable mandrel for supporting a mantle, a knife adapted to coact with said mandrel for trimming the mantles, a lever on which said knife is mounted and means operating on said lever to move the knife into and out of operative position relatively to the mandrel, said means comprising a spring for moving the lever in one direction and a cam for moving the lever in a reverse direction.

7. The combination in a mechanism for trimming mantles, of a plurality of mandrels for supporting mantles, a plurality of knives for coacting with said mandrels for trimming the mantles, means for simultaneously moving the knives into and out of operative position relatively to said mandrels and means for causing a simultaneous rotation of said mandrels.

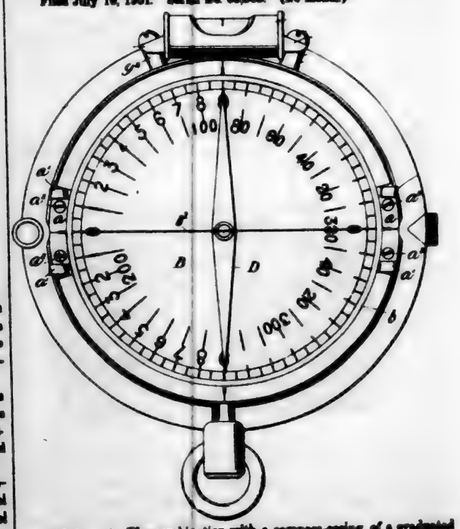
709,045. RAIL-JOINT. LUDWIG ROTH, St. Louis, Mo. Filed July 2, 1902. Serial No. 114,144. (No model.)



Claim.—1. A rail-joint comprising a channel extension formed integrally with one end of the rail, and adapted to receive the opposite end and support the flanges of the next adjacent rail, substantially as set forth.

2. A rail-joint comprising a channel extension formed integrally with one end of the rail and having its outer walls extending respectively beyond the web and below the lower flange thereof, a pocket formed in the chamber of the channel below the end of the rail proper, and adapted to receive the opposite end, and support the flanges of the next adjacent rail, a tongue forming a continuation of the lower flange of the end inserted into the channel, and adapted to be received by the said pocket, and securing-bolts passed through the side walls of the channel and the web of the rail end thus inserted, substantially as set forth.

709,046. POCKET-COMPASS. CHARLES C. RUDDER, Butte, Mont. Filed July 16, 1901. Serial No. 68,508. (No model.)



Claim.—1. The combination with a compass-casing, of a graduated disk revolubly mounted upon a central spindle within said casing, the casing inclosing said disk at the bottom and sides but being open at the top whereby the entire upper face of said disk is exposed to view, a magnetic needle revolubly mounted above and independently of said disk, and adapted to read over the entire upper face of the disk at all times, and arresting devices for said disk, substantially as described.

2. The combination with a compass-casing, of a graduated disk revolubly mounted upon a central spindle within said casing, the casing inclosing said disk at the bottom and sides but being open at the top, whereby the entire upper face of said disk is exposed to view, a magnetic needle revolubly mounted above and independently of said disk, and adapted to read over the entire upper face of the disk at all times, arresting devices for said disk and independent arresting devices for said needle substantially as described.

3. In a compass, the combination with the casing, of a pivotally-mounted disk within said casing, provided with portions adapted to engage the top of the casing to arrest said disk, an adjusting-screw for raising said disk to bring said portions into engagement with the top of the casing, a center pin having a threaded portion passing through said adjusting-screw, and a needle mounted on said center pin above said disk whereby said center pin may be adjusted to raise the needle into contact with the top of the casing, substantially as described.

4. In a compass, the combination with the casing, of a pivotally-mounted disk within the casing provided with a vertically-disposed flange terminating at its upper end in a horizontal flange, and provided with a scale of divisions on the disk proper, the inner face of said vertical flange and the upper face of said horizontal flange, a needle mounted in said casing and adapted to rotate independently of said disk and independent devices for arresting the disk and needle, substantially as described.

5. In a compass, the combination with the casing, of a pivotally-mounted disk within the casing provided with a vertically-disposed flange terminating at its upper end in a horizontal flange, and provided with a scale of divisions on the disk proper, the inner face of said vertical flange and the upper face of said horizontal flange, a needle mounted in said casing and adapted to rotate independently of said disk and independent devices for arresting the disk and needle, and a weight secured to said disk eccentrically thereof, the compass-casing being also provided with division-markings, substantially as described.

6. In a compass, the combination with the compass-casing, provided with sighting devices, of a revolubie disk pivoted centrally within said casing, a weight secured to said disk eccentrically thereof, and an adjustable securing device passing eccentrically through said weight, whereby said weight may be adjusted with respect to said disk, substantially as described.

7. In a pocket-compass, the combination with the compass-casing provided with sighting devices, of a revolubie disk mounted in said casing, a needle mounted in said casing and adapted to rotate independently of said disk, independent arresting devices for said disk and needle, and a weight secured to said disk adjacent to its periphery, constructed to cause that portion of said disk to swing beneath its center, when the casing is held in a vertical position, whereby the device may be used as a clinometer and the disk arrested for reading, substantially as described.

8. In a compass, the combination with the circular casing, of a needle mounted in said casing, a ring revolubly mounted on the exterior of said casing, and a level secured to said ring, substantially as described.

9. In a compass, the combination with the casing provided with sighting devices, of a ring revolubly mounted on said casing, a level secured to said ring, devices for adjusting said level in the plane of said ring and independent devices for adjusting said level perpendicularly to the plane of the ring, substantially as described

10. In a compass, the combination with the casing provided with sighting devices, of a ring revolubly mounted on the casing, a level provided with bifurcated portions at each end, sleeves engaging said bifurcated portions of the level and provided with eccentric apertures therethrough and adjusting-screws passing through said sleeves threaded into said ring and having portions engaging the bifurcated portions of said level, whereby said level can be adjusted in the plane of the ring and also perpendicularly to the plane of the ring, substantially as described.

11. In a compass, the combination with the casing provided with sighting means and with an annular scale of divisions and a needle mounted in said casing, of a ring mounted revolubly on said casing and provided with index-marks, adapted to register with the divisions of said scale on the casing, and a bubble-tube or level secured to said ring, substantially as described.

12. In a compass, the combination with the casing, of a ring revolubly mounted thereon, a level or bubble-tube secured to said ring and a torch pivotally secured to said casing and having a wick-tube extending to the top of the casing, whereby said bubble-tube may be rotated about the casing and said bubble-tube and the compass illuminated at any point, substantially as described.

ing inclosing said disk at the bottom and sides but being open at the top whereby the entire upper face of said disk is exposed to view, a magnetic needle revolubly mounted above and independently of said disk, and adapted to read over the entire upper face of the disk at all times, and arresting devices for said disk, substantially as described.

2. The combination with a compass-casing, of a graduated disk revolubly mounted upon a central spindle within said casing, the casing inclosing said disk at the bottom and sides but being open at the top, whereby the entire upper face of said disk is exposed to view, a magnetic needle revolubly mounted above and independently of said disk, and adapted to read over the entire upper face of the disk at all times, arresting devices for said disk and independent arresting devices for said needle substantially as described.

3. In a compass, the combination with the casing, of a pivotally-mounted disk within said casing, provided with portions adapted to engage the top of the casing to arrest said disk, an adjusting-screw for raising said disk to bring said portions into engagement with the top of the casing, a center pin having a threaded portion passing through said adjusting-screw, and a needle mounted on said center pin above said disk whereby said center pin may be adjusted to raise the needle into contact with the top of the casing, substantially as described.

4. In a compass, the combination with the casing, of a pivotally-mounted disk within the casing provided with a vertically-disposed flange terminating at its upper end in a horizontal flange, and provided with a scale of divisions on the disk proper, the inner face of said vertical flange and the upper face of said horizontal flange, a needle mounted in said casing and adapted to rotate independently of said disk and independent devices for arresting the disk and needle, substantially as described.

5. In a compass, the combination with the casing, of a pivotally-mounted disk within the casing provided with a vertically-disposed flange terminating at its upper end in a horizontal flange, and provided with a scale of divisions on the disk proper, the inner face of said vertical flange and the upper face of said horizontal flange, a needle mounted in said casing and adapted to rotate independently of said disk and independent devices for arresting the disk and needle, and a weight secured to said disk eccentrically thereof, the compass-casing being also provided with division-markings, substantially as described.

6. In a compass, the combination with the compass-casing, provided with sighting devices, of a revolubie disk pivoted centrally within said casing, a weight secured to said disk eccentrically thereof, and an adjustable securing device passing eccentrically through said weight, whereby said weight may be adjusted with respect to said disk, substantially as described.

7. In a pocket-compass, the combination with the compass-casing provided with sighting devices, of a revolubie disk mounted in said casing, a needle mounted in said casing and adapted to rotate independently of said disk, independent arresting devices for said disk and needle, and a weight secured to said disk adjacent to its periphery, constructed to cause that portion of said disk to swing beneath its center, when the casing is held in a vertical position, whereby the device may be used as a clinometer and the disk arrested for reading, substantially as described.

8. In a compass, the combination with the circular casing, of a needle mounted in said casing, a ring revolubly mounted on the exterior of said casing, and a level secured to said ring, substantially as described.

9. In a compass, the combination with the casing provided with sighting devices, of a ring revolubly mounted on said casing, a level secured to said ring, devices for adjusting said level in the plane of said ring and independent devices for adjusting said level perpendicularly to the plane of the ring, substantially as described

10. In a compass, the combination with the casing provided with sighting devices, of a ring revolubly mounted on the casing, a level provided with bifurcated portions at each end, sleeves engaging said bifurcated portions of the level and provided with eccentric apertures therethrough and adjusting-screws passing through said sleeves threaded into said ring and having portions engaging the bifurcated portions of said level, whereby said level can be adjusted in the plane of the ring and also perpendicularly to the plane of the ring, substantially as described.

11. In a compass, the combination with the casing provided with sighting means and with an annular scale of divisions and a needle mounted in said casing, of a ring mounted revolubly on said casing and provided with index-marks, adapted to register with the divisions of said scale on the casing, and a bubble-tube or level secured to said ring, substantially as described.

12. In a compass, the combination with the casing, of a ring revolubly mounted thereon, a level or bubble-tube secured to said ring and a torch pivotally secured to said casing and having a wick-tube extending to the top of the casing, whereby said bubble-tube may be rotated about the casing and said bubble-tube and the compass illuminated at any point, substantially as described.

13. In a compass, the combination with the casing, of a rotary disk mounted in said casing, a needle mounted in said casing and adapted to rotate independently of said disk, independent arresting devices for said disk and needle, folding diopters hinged to said casing and provided at their lower ends with bifurcated portions and at their upper ends with hook portions terminating in indicating-points, each of said diopters being provided with a sight-line, coinciding with its said indicating-point, substantially as described.

14. In a compass, the combination with the casing, of a rotary disk mounted in said casing, a needle mounted in said casing and adapted to rotate independently of said disk, independent arresting devices for said disk and needle, folding diopters, hinged to said casing and provided at their lower ends with bifurcated portions and at their upper ends with hook portions terminating in indicating-points, each of said diopters being provided with a sight-line, coinciding with its said indicating-point, one of said diopters being provided with a mirror above its bifurcated portion, substantially as described.

15. In a compass, the combination with the casing provided with a needle, of a support below said casing, pivotally connected with said casing, folding diopters pivoted to said casing, and adapted to be swung over and downwardly into the plane of the said support and provided with indicating-points, whereby the compass-casing may be revolved upon said support, the indicating-points of said diopters allowed to rest upon a paper and points taken directly therefrom in plotting, substantially as described.

16. In a compass, the combination with a casing, of a disk revolubly mounted therein, a weight secured eccentrically to said disk, a glass cover secured to said casing, flush with the upper surface thereof and a permanent sighting-line marked upon said glass cover, substantially as described.

17. In a compass, the combination with the casing, of a center pin threaded into the bottom thereof, a transparent cover for said casing, a needle revolubly mounted on said center pin beneath said cover, and having parts adapted to engage said cover to arrest the needle when the center pin is turned to raise the needle, said center pin having a part for engaging a part connected with the casing to prevent overwinding and thereby protect said center pin, substantially as described.

18. In a compass, the combination with the casing provided with a cover, of a vertically-adjustable center pin, and a needle having a bearing engaging said pin, said needle having lateral spring portions extending above the said bearing, and adapted to engage the said cover before the said bearing, whereby the needle can be arrested without injury to the center pin or pivot-cup, substantially as described.

19. In a compass, the combination with the casing, of a rotary disk mounted within the casing and provided with a central bearing, a support for said bearing threaded into said casing, a center pin threaded in said disk-support, and extending through said disk, and a needle mounted upon said center pin and adapted to revolve freely, independently of said disk, substantially as described.

20. In a compass, the combination with the casing provided with a transparent cover, of a rotary disk mounted within the casing below said cover and provided with a central bearing, an adjusting-screw threaded into the bottom of the casing adapted to support the central bearing of said disk, and to raise said disk into contact with said cover to arrest said disk, said screw having a shoulder for engaging the casing to prevent overwinding, a center pin threaded into said adjusting-screw and extending through said disk, a needle mounted on said center pin and adapted to revolve freely, said needle having parts adapted to engage the said cover when the needle is raised by said center pin, to arrest the needle, said center pin having a shoulder to engage said adjusting-screw to prevent overwinding, substantially as described.

21. In a compass, the combination with the casing provided with a transparent top or cover, of a center pin having a threaded portion, and a shoulder to prevent overwinding and a needle having a central bearing engaging the center pin, and lateral spring portions extending therefrom and curved upward above the plane of the top of said bearing, substantially as described.

22. In a compass, the combination with the casing, of an annular torch-body, pivotally secured to the casing and provided with an upwardly-extending wick-tube, substantially as described.

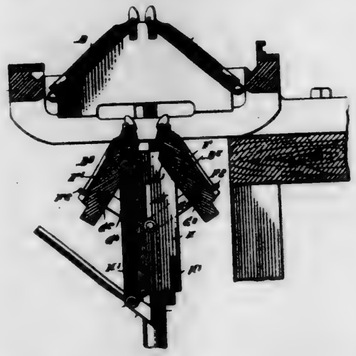
23. In a compass, the combination with the casing, of an annular torch-body detachably and pivotally secured to the bottom of said casing and provided with a vertically-extending wick-tube, substantially as described.

24. In a compass, the combination with the casing provided with a transparent top or cover, of a disk pivotally mounted at its center within said casing, a needle in said casing, a revolubie ring on said casing, a level secured to said ring, folding diopters secured to said casing, and an annular torch pivotally secured to the bottom of the casing, forming a support

thereto and provided with a vertically-extending wick-tube, substantially as described.

25. In a compass, the combination with the casing provided with a vertically-adjustable center pin, extending through the bottom of said casing, a needle on said center pin, an annular torch-body pivotally secured to the bottom of the casing provided with a wick-tube extending above the top of the casing, said torch being provided with depending feet forming a support for the wick-tube and casing and protecting the outer end of the center pin from injury, substantially as described.

709,047. **KNITTING-MACHINE.** MAX SALDEN, New York, N. Y., assignor, by direct and mesne assignments, to Otto L. Mayer, New York, N. Y. Filed Mar. 13, 1901. Renewed Dec. 26, 1901. Serial No. 87,234. (No model.)



Claim.—1. A knitting-machine having groups of needles bodily movable with the fabric knitted, as set forth.

2. A knitting-machine having spaced groups of needles bodily movable with the fabric knitted, as set forth.

3. A knitting-machine, provided with needle-plates having movable sections, as set forth.

4. A knitting-machine, provided with needle-plates having movable sections arranged in pairs, as set forth.

5. A knitting-machine, provided with needle-plates having movable sections arranged in pairs, and means for moving said movable sections and their groups of needles bodily with the fabric knitted, as set forth.

6. A knitting-machine, provided with needle-plates having movable sections arranged in pairs, and means for moving said movable sections and their groups of needles bodily with the fabric knitted, said means operating in conjunction with the movement given to the carriage of the machine, as set forth.

7. A knitting-machine, provided with needle-plates having movable sections, needles contained in said plates and their sections, means for imparting a swinging motion to the said needle-plate sections and the groups of needles therein, and means for feeding said needle-plate sections in unison with the fabric as the latter is knitted, as set forth.

8. A knitting-machine, comprising a reciprocating carriage, a double yarn or thread carrier having releasing devices, means for operating the same, needle-plates having movable sections, needles contained in said needle-plates and their sections means for imparting a swinging motion to said needle-plates, and means for moving said sections and their groups of needles bodily downward with the fabric as the latter is knitted, as set forth.

9. A knitting-machine, comprising a reciprocating carriage, a double yarn or thread carrier having releasing devices, means for operating the same, needle-plates having movable sections, needles contained in said needle-plates and their sections, means for imparting a swinging motion to said needle-plates, and means for moving said sections and their groups of needles bodily downward with the fabric as the latter is knitted, said first-named means being under the control of the operator, and the second-named means operating in conjunction with the reciprocating carriage, as set forth

---

709,048. **VICTUAL-PROTECTOR.** WILLIAM H. SAMMAN and JESSE H. SAMMAN, Schuylkill Haven, Pa. Filed Mar. 14, 1902. Serial No. 98,268. (No model.)

Claim.—1. A victual-protector for use in the bottom of cooking vessels, consisting of a sheet-metal plate, there being several rounded projections on the upper side of the protector-plate, and integral therewith, and perforations in the plate distributed among said projections.

2. A victual-protector, for use in the bottom of cooking vessels, consisting of a sheet-metal perforated plate, there being several rounded projections on the upper side of the protector-plate and integral therewith, and similar but reversed projections on the opposite side of the plate and serving as legs.

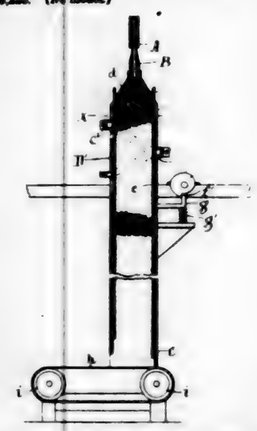
3. A victual-protector, for use in the bottom of cooking vessels, consisting of a sheet-metal perforated plate, there being several rounded projections on the upper side of the protector-plate and integral therewith, and an integral ribbed portion surrounding the part having said projections.

4. A victual-protector, for use in the bottom of cooking vessels, consisting of a sheet-metal perforated plate, said plate having integral projections, and a ribbed portion around its periphery.

5. A victual-protector, for use in the bottom of cooking vessels, consisting of a circular perforated plate having integral projections, a ribbed portion around the periphery of the plate, said ribs being at an angle to the radii of the plate.

6. A victual-protector for use in the bottom of cooking vessels, consisting of a sheet-metal plate, there being several integral projections extending from the plane of the plate upward, and separate projections extending from the plane of the plate downward, as and for the purpose set forth.

709,049. **MACHINE FOR FORMING AND DRYING TOOTHPICKS.** CHARLES F. SEAMMAN, Portland, Me.; Thalia L. Seamman administratrix of said Charles F. Seamman, deceased. Filed Oct. 19, 1901. Serial No. 79,223. (No model.)



Claim.—1. In a machine for making and drying toothpicks, the combination of a toothpick-knife and a cutting-block, of a vertical spout for receiving the picks as formed, means for removing the picks from the lower end of the spout, a plate lining one of the sides of said spout and having a limited vertical motion therein, a lining for the inner surface of said plate having a pile-like inner surface and means for vertically reciprocating said plate.

2. In a machine for making and drying toothpicks, the combination of a toothpick-knife and a cutting-block, of a vertical spout for receiving the picks as formed, means for removing the picks from the lower end of the spout, two of the sides of said spout being formed of pervious material and each of the remaining sides having on its inner surface a plate adapted to have a limited vertical motion, a lining for the inner surface of said plate having a pile-like inner surface and means for vertically reciprocating said plate.

3. In a machine for making and drying toothpicks, the combination of a toothpick-knife and a cutting-block, of a vertical spout for receiving the picks as formed, means for removing the picks from the lower end of the spout, a plate forming the lining of one of the sides of said spout having a limited vertical motion therein, a lining for the inner surface of said plate having a pile-like inner surface and means for depressing said plate slowly and raising it quickly.

4. In a machine for making and drying toothpicks, the combination of a toothpick-knife and cutting-block, of a vertical spout for receiving the picks as formed, two opposite sides of said spout being formed of pervious material and each of the remaining sides of the spout having on its inner surface a plate lined with card-clothing and means for vertically reciprocating said plates.

5. In a machine for making and drying toothpicks, the combination of a toothpick-knife and a cutting-block, of a vertical spout for receiving the picks as formed, means for removing the picks at the lower end of the spout and a plate lining one of the sides of said spout and having a limited reciprocating vertical motion therein for passing the column of picks downward.

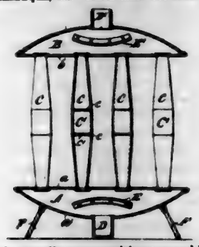
709,050. **MACHINE FOR DRYING TOOTHPICKS.** CHARLES F SEAMMAN, Portland, Me.; Thalia L. Seamman administratrix of said Charles F. Seamman, deceased. Filed Jan. 30, 1902. Serial No. 90,514. (No model.)

Claim.—1. In a machine for drying toothpicks the combination of a vertical spout for conveying the toothpicks in a solid column through the drier, said spout having one or more of its sides formed of wire-gauze or other like flexible material, a rigid support to which the lower end of said wire-gauze is secured and a flat spring resting against the outside of the gauze immediately above the rigid support.

2. In a machine for drying toothpicks the combination of a vertical spout for conveying the toothpicks in a solid column through the drier, said spout having one or more of its sides formed of wire-gauze or other like flexible material, a rigid support to which the lower end of said wire-gauze is secured and a flat spring-supported plate resting against the outside of the gauze immediately above the rigid support.

3. In a machine for drying toothpicks the combination of a vertical spout for conveying the toothpicks in a solid column through the drier, said spout having one or more of its sides formed of wire-gauze or other like flexible material, the lower end of the wire-gauze being provided with a slightly-yielding spring-support adapted to resist pressure from the inside of the spout.

709,051. **HEAT-RADIATOR FOR SMOKE-PIPES.** JOHN P. SCHEELER, Catasauqua, Pa. Filed Mar. 20, 1902. Serial No. 98,111. (No model.)

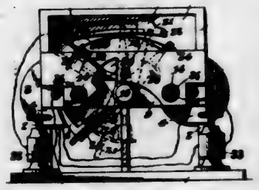


Claim.—1. A heat-radiator comprising top and bottom sections connected by one or more rows of vertical flues secured to the opposing flat wall thereof, the lower and upper walls of said sections being outwardly arched and having inlet and outlet connections respectively located midway of their length, and oppositely-arched deflector-plates in said sections covering said openings and forming reduced side passage-ways thereto, whereby the draft through the connecting-flues is equalized substantially as set forth.

2. The combination with the lower and upper radiator-sections of connecting double-conical flues having their reduced opposite ends connected to said lower and upper sections respectively and provided with partition-plates in the enlarged portions between the sections, said plates being formed with reduced passage-ways substantially as and for the purpose set forth.

3. A heat-radiator comprising similar reversely-arranged top and bottom horizontal sections having opposing flat walls and outwardly-arched outer walls with central openings, oppositely-arched deflector-plates in said sections covering said openings and forming reduced side passage-ways thereto, vertical double-conical flues having their reduced opposite ends connected to said opposing flat plates, and partition-plates in the enlarged portions of said flues having reduced openings therethrough substantially as and for the purpose set forth.

709,052. **ELECTRIC RAILWAY-SIGNAL.** CLAUDE D. SEAMAN, Topeka, Kans., assignor of one-half to C. C. Gardiner, Topeka, Kans. Filed Nov. 7, 1901. Serial No. 81,441. (No model.)



Claim.—1. In an electric railway-signal, the combination with a single two-battery track-circuit and a single relay included therein, of an alarm-circuit controlled by the armature of the relay.

2. In an electric railway-signal, the combination with a signal-block comprising track-sections, and a single normally closed two-battery track-circuit having its batteries connected with the tracks at the opposite ends of the block, of a single relay included in said track-circuit, and an alarm-circuit controlled by the armature of the relay.

3. In an electric railway-signal, the combination with a signal-block including tracks, one extending from end to end of the block and the other divided at the crossing by an insulating-joint, of a pair of batteries, one of which is connected with the tracks at each end of the block, a single relay having its terminals connected to the divided track at opposite sides of the crossing-joint, and an alarm-circuit controlled by the armature of the relay.

4. In an electric railway-signal, the combination with a single normally closed two-battery track-circuit, and a single relay included therein, of an alarm-circuit, and a contact device therefor, controlled by the armature of the relay and arranged to close the alarm-circuit when either of the batteries is short-circuited by a train approaching the crossing.

5. In an electric railway-signal, the combination with a two-battery track-circuit, and a single relay included therein, of an alarm-circuit, and a contact device for opening and closing the alarm-circuit, said contact device being controlled by the relay-armature and arranged to close the alarm-circuit when either battery is short-circuited by a train approaching the crossing, and when both batteries are short-circuited by a passing train.

6. In an electric railway-signal, the combination with a two-battery track-circuit, and a single relay included therein, of an alarm-circuit, and a contact device therefor arranged to close the alarm-circuit when a battery is short-circuited by a train approaching the crossing, and to open said circuit when a battery is short-circuited by a train receding from the crossing.

7. In an electric railway-signal, the combination with a two-battery track-circuit, and a single relay included therein, of an alarm-circuit, and a contact device therefor arranged to close the alarm-circuit when a battery is short-circuited by a train approaching the crossing, and when both batteries are short-circuited by a train located at the crossing, and to open said circuit when a battery is short-circuited by a train receding from the crossing.

8. In an electric railway-signal, the combination with a signal-block including tracks, one extending continuously from end to end of the block, and the other being divided by an insulating-joint located at the crossing, of a pair of batteries, one of which is connected with the tracks at each end of the block, a single relay having its terminals connected to the divided track at opposite sides of the crossing-joint, an alarm-circuit, and a contact device for opening and closing said circuit and controlled by the relay-armature, said contact device being arranged to close the alarm-circuit by the short-circuiting of a battery by a train approaching the crossing, and to close said circuit when a battery is short-circuited by a train receding from the crossing.

9. In an electric railway-signal, the combinatio. with a signal-block including tracks, one extending continuously from end to end of the block, and the other being divided by an insulating-joint located at the crossing, of a pair of batteries, one of which is connected with the tracks at each end of the block, a single relay having its terminals connected to the divided track at opposite sides of the crossing, an alarm-circuit, and a con-

that device for opening and closing said circuit and controlled by the armature of the relay, said contact device being arranged to close the alarm-circuit when one of the batteries is short-circuited by a train approaching the crossing, and when both batteries are short-circuited by a train located at the crossing, and to open the circuit when one of the batteries is short-circuited by a train receding from the crossing.

10. In an electric railway-signal, the combination with a two-battery track-circuit including a relay, a contact-arm operatively connected to the relay-armature, and an alarm-circuit, of an alarm-circuit terminal disposed for sliding contact with the arm when the latter is moved in one direction, and for electrical disconnection with the arm during the return movement of the latter.

11. In an electric railway-signal, the combination with a two-battery track-circuit including a relay, of an alarm-circuit, a contact-arm operated by the relay-armature and constituting one terminal of the alarm-circuit, a contact-plate constituting the other terminal of the alarm-circuit and disposed to compel the arm to traverse the opposite sides of the plate during its movement in opposite directions, and means for insulating the arm from one side of the plate, so that the alarm-circuit will be closed by the movement of the arm in one direction, and will be open during the movement of the arm in the opposite direction.

12. In an electric railway-signal, the combination with a two-battery track-circuit, and a relay included therein, of an alarm-circuit, a contact-arm constituting one terminal of the alarm-circuit and operatively related to the relay-armature, primary and secondary contact-plates constituting a divided terminal of the alarm-circuit, means for compelling the contact-arm to ride upon and electrically contact with the primary contact-plate prior to the contact of the arm with the secondary contact-plate, and means for preventing electrical contact of the arm with the primary plate as said arm is moved back toward its normal position after contact with the secondary contact-plate.

13. In an electric railway-signal, the combination with an alarm-circuit, of a swinging contact-arm constituting one terminal of the alarm-circuit, primary and secondary contact-plates constituting the other terminal of the alarm-circuit and disposed in overlapping relation, said contact-arm being related to the plates in a manner to cause it when moved in one direction to establish electrical contact with the primary contact-plates, to subsequently contact with the secondary contact-plate, and to move behind the primary contact-plate when returning to its normal position, and means for insulating the primary contact-plate from the arm when the latter is moved behind the same.

14. In a contact device for electric railway-signals and the like, the combination with an electric circuit, and a swinging contact-arm constituting one terminal thereof, of a second terminal comprising primary and secondary spring members, said primary member being extended beyond the end of the secondary member and having its extremity deflected, whereby the contact-arm is compelled to move in one direction in advance of the primary spring member, and is permitted to move in the opposite direction behind the latter, and an insulating material imposed upon one face of the contact-arm to prevent electrical contact thereof with the rear side of the primary contact member.

15. In an electric railway-signal, the combination with a track-circuit, and a relay, of an alarm-circuit, a contact device for said alarm-circuit including a weighted contact-arm operatively related to the relay-armature, and means for regulating the resistance opposed to the movement of said arm.

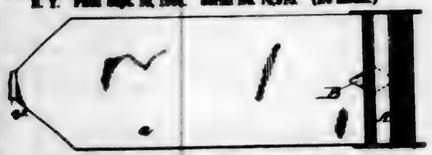
16. In an electric railway-signal, the combination with a track-circuit including a relay, of an alarm-circuit, a contact device for said circuit including a contact-arm operatively related to the relay-armature, and an adjustable weight connected to said arm to resist the movement thereof in one direction.

17. In an electric railway-signal, the combination with a track-circuit, a relay included therein, and an alarm-circuit, of a contact device for said alarm-circuit including a swinging contact-arm operatively related to the relay-armature, and adjustable primary and secondary weights connected to said contact-arm and arranged to resist the movement thereof in one direction.

18. In a circuit-closing device for electric railway-signals and the like, the combination with a contact-plate, of a swinging arm provided with a primary weight for retaining the arm in one position, a secondary weight movable independently of the arm, and means for connecting said arm through the movement thereof with the secondary weight, whereby initial movement of the arm in one direction will be opposed by the primary weight only, while continued movement thereof will be opposed by both the primary and secondary weights.

19. The combination with an electric circuit provided with a terminal, of a contact-arm arranged for sliding contact with said terminal when moved in one direction, and for electrical disconnection from the terminal during the return movement of the arm.

709,053. PHOTOGRAPHIC FILM. CHARLES H. SHAW, Brooklyn, N. Y. Filed Sept. 10, 1900. Serial No. 29,910. (No model.)



Claim.—1. In combination with a photographic film coiled upon a spool, of means located between the ends of the film for preventing the film unrolling or becoming loosened until such means are broken or otherwise destroyed, said means arranged intermediate of the side edges of the film and at such a distance from the outer end thereof as to permit of the film being threaded in a camera with the said means unbroken.

2. In combination with a photographic film consisting of a sensitized strip and an opaque strip, which strips are superimposed and wound upon a spool, a device for securing the end of the film to prevent it from unwinding, and a second device intermediate the ends of the film and arranged between, and overlaid by, adjacent coils of the film for preventing a portion of the film from becoming unwound or loosened after the breaking of the first device.

3. In combination with a photographic film, wound upon a spool, of a paper seal arranged between, and overlaid by, adjacent coils of the opaque strip of the film for preventing a portion of the film from unwinding or becoming loosened on the spool, until after the seal is destroyed, and a device for securing an end of the film beyond said paper seal.

4. In combination with a photographic film comprising a sensitized strip, and an opaque strip of greater length than said sensitized strip, said photographic film coiled upon a spool, fragile means located intermediate an end of the sensitized strip and an end of the opaque strip for preventing the film from becoming unwound or loosened on the spool until broken, and a device for securing an end of the paper beyond said means.

5. In combination with a photographic film coiled upon a spool, of means for securing the end of the opaque strip thereof to prevent the film from becoming unwound or loosened until it is broken, and a second means located intermediate of the said secured end of the opaque strip and the adjacent end of the sensitized strip for preventing that portion of the film comprising the sensitized strip from becoming unwound or loosened after the first means is destroyed, said means consisting of a paper piece rendered adhesive on both sides.

6. The combination with a spool and a photographic film wound thereon, of a seal, located between adjacent convolutions of the wound film, and secured thereto by adhesion on both sides, so that said adjacent convolutions will be secured to opposite sides of the said seal.

7. The combination with a spool and a photographic film wound thereon, of a seal composed of paper or similar material, and rendered adhesive on both sides, located between adjacent convolutions of the wound film, whereby adjacent convolutions will be secured to opposite sides of the said seal.

8. The combination with a spool and a photographic film wound thereon, of a seal, located between adjacent convolutions of the wound film, and secured thereto by adhesion on both sides, so that said adjacent convolutions will be secured to opposite sides of the said seal, and arranged at such a distance from the outer end of the film as to permit of the film being threaded in a camera with the said seal unbroken.

9. The combination with a spool and a photographic film wound thereon, of a seal composed of paper or similar material, and rendered adhesive on both sides, located between adjacent convolutions of the wound film, whereby adjacent convolutions will be secured to opposite sides of the said seal, and arranged at such a distance from the outer end of the film that at least one coil may be unwound before the said seal is broken.

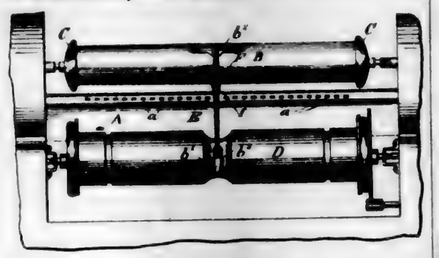
709,054. PERFORATED MUSIC-SHEET FOR AUTOMATIC MUSICAL INSTRUMENTS. CHARLES H. SHAW, Brooklyn, N. Y., assignor to the Aeolian Company, New York, N. Y., a Corporation of Connecticut. Filed Mar. 20, 1902. Serial No. 99,049. (No model.)

Claim.—1. The combination with a music-roll and a music-sheet of a cord or similar material extending from the same and provided with an engaging device for attachment to the take-up roll of an automatic musical instrument.

2. The combination with a music-roll and a music-sheet of a cord or similar material extending from the same and provided with an engaging device consisting of a ring for attachment to the take-up roll of an automatic musical instrument.

3. The combination with a music-roll and a music-sheet of a cord or similar material extending from the same and a catch for the free end portion of the cord.

4. The combination with a music-roll and a music-sheet of a cord or similar material extending from the same, and a catch consisting of a hook for the free end portion of the cord.

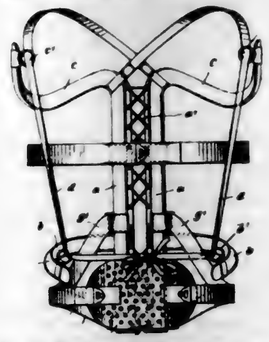


5. The combination with a music-roll and a music-sheet of a cord or similar material extending from the same and a catch consisting of a resilient hook for the free end portion of the cord.

6. The combination with a music-roll and a music-sheet of a cord or similar material extending from the same, and a catch consisting of a hook extending from a plate through which portions of the cord or similar material are threaded.

7. The combination with a music-roll and a music-sheet of a cord or similar material extending from the same and provided at its outer end with an engaging device for attachment to the take-up roll of a musical instrument, and provided intermediate of its ends with a catch for engaging the free end portion of the cord or similar material.

709,055. BODY-BRACE. PHILO B. SHELDON, Erie, Pa., assignor to the Philo Burt Manufacturing Company, Jamestown, N. Y. Filed Aug. 28, 1901. Serial No. 73,535. (No model.)

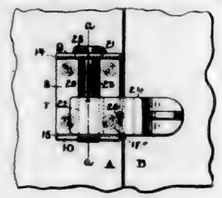


Claim.—1. A body-brace, comprising a main or body portion adapted to extend along the spine of the wearer, arms attached to the lower part of the said body portion in position to rest on the hips of the wearer, arms extending out from the upper part of the body portion and curved forward to bear under the armpits of the wearer, whereby to sustain the trunk on the hips, and straps attached to the upper part of the body and passed forwardly over the shoulders of the person, the straps having connection with the ends of the said arms and being joined together at the lower part of the appliance.

2. A body-brace having two rigid bars extending vertically in parallelism and adapted to be located at the back of the person, lacing extended between the bars to connect them together, rigid arms attached respectively to the upper ends of the bars and extending outward to lie under the armpits of the person, additional rigid arms attached respectively to the lower portions of the rigid bars and extending outward and forward to lie on the hips of the person and means for fastening the appliance in place.

709,056. LOCK. GEORGE G. SMITH, Florence, Italy. Filed Nov 28, 1901. Serial No. 83,704. (No model.)

Claim.—1. A lock comprising a base-plate; a pin embodying a pivot and a locking-seat carried thereby; a bolt capable of turning on the pivot and of locking on the seat; holes through the base-plate capable of receiving screws; a plate effective to overlie a portion of the holes and screws therein; a hole in the plate capable of receiving a screw; a bolt carried by the base-plate, and capable of overlying the screw traversing the plate; the organization being such that the plate locks the screws which it overlies, and the bolt locks the screw which holds the plate.



2. In a lock the combination with a base-plate, of a bolt pivoted thereon and capable of being locked in its closed position; means effective to hold the base-plate in position; an independent member for closing access to the holding means; and means covered by the bolt, in its closed position, for holding said access-closing member in place.

3. In a lock, the combination of a frame having a base-plate provided with countersunk screw-holes, one of which is countersunk to less depth than the others; and a plate effective to overlie the screw-holes, and having a countersink registering with the screw-hole of the least countersunk, and together capable of receiving the same-sized screw that the other holes are capable of receiving.

4. In a lock effective to be secured by screws, means for locking all the screws but one in place; a screw for securing the locking means in place; and a bolt effective to control the securing-screw.

5. The combination of a base-plate; end members thereon; undercut ways in the end members; squared holes in the end members; a pin, having a head, squared ends, and a pivot portion secured in the squared holes; a bolt, having a squared pivot-hole, on the pin; screw-holes in the base-plate; a plate capable of sliding in the ways; and a screw-hole in the plate capable of registering with a screw-hole in the base-plate and of receiving a screw.

6. The combination of a base-plate; end members thereon; undercut ways in the end members; squared holes in the end members; a pin, having a head, squared ends, and a pivot portion secured in the squared holes; a bolt, having a squared pivot-hole, on the pin; screw-holes in the base-plate; one of which screw-holes occupies a position under the bolt when closed; a plate capable of sliding in the ways; a screw-hole in the plate capable of registering with the bolt-covered screw-hole in the base-plate and of receiving a screw; and means for locking the bolt.

7. The combination of a bolt, means capable of supporting the bolt in two different planes, and to afford a pivot therefor when in one of the planes; and a spring-detent effective to hold the bolt away from the pivot portion.

8. The combination of a bolt; means capable of supporting the bolt in two different planes, and to afford a pivot therefor when in one of the planes; and a spring-detent effective to hold the bolt on either portion.

9. The combination of a bolt; means capable of supporting the bolt in two different planes, and to afford a pivot therefor when in one of the planes; and a spring-detent effective to hold the bolt when on the pivot portion in any position it may be placed.

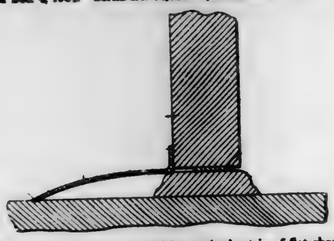
10. The combination of a pin affording a pivot and pivotless seat for a bolt; a bolt thereon; a groove in the pin; a spring secured in the groove and capable of engaging the bolt.

11. The combination of a pin affording a pivot and a pivotless seat for a bolt; a bolt thereon; a depression in the bolt; a groove in the pin; a spring secured in the groove and having an upturned end and capable of engaging the depression in the bolt.

12. The combination of a base-plate; end members thereon; undercut ways in the end members; squared holes in the end members; a pin, having a head, squared ends, and a pivot portion, secured in the squared holes; a bolt, having a squared pivot-hole, on the pin; screw-holes in the base-plate; a plate capable of sliding in the ways; a screw-hole in the plate capable of registering with screw-holes in the base-plate and of receiving a screw; a groove in the pin; and a spring in the groove effective to hold the bolt off the pivot portion of the pin.

13. The combination of a base-plate; end members thereon; undercut ways in the end members; squared holes in the end members; a pin, having a head, squared ends, and a pivot portion, secured in the squared holes; a bolt, having a squared pivot-hole, on the pin; screw-holes in the base-plate; one of which screw-holes occupies a position under the bolt when closed; a plate capable of sliding in the ways; a screw-hole in the plate capable of registering with the bolt-covered screw-hole in the base-plate and of receiving a screw and means for locking the bolt, a groove in the pin, and a spring in the groove effective to hold the bolt off the pivot portion of the pin.

709,057. DOOR-CATCH. GIOSUE G. BETTI, Florence, Italy. Filed Dec. 4, 1901. Serial No. 84,615. (No model.)



Claim.—A door-detent comprising a single strip of flat sheet metal and embodying a portion for interposition between a door and saddle; a struck-up lug adjacent to such portion for engagement with the side of the door; and a portion curving transversely from such former portion, and provided at its end with integral teeth for engagement with the floor.

709,058. DEVICE FOR THE CURE OF STRABISMUS. JOHN B. STEBBLE, Eau Claire, Wis. Filed Nov. 11, 1901. Serial No. 81,907. (No model.)

Claim.—1. A device for treating strabismus, consisting of one or more opaque plates having enlarged openings, slides covering said openings, and inwardly-projecting sight-tubes carried by the slides and adjustable therewith to accommodate the position of the pupils of the affected eyes.

2. A device for treating strabismus, comprising plates having central openings, and sight-tubes projecting inwardly from the plates and adjustable over the entire area of said openings.

3. A device for treating strabismus, comprising one or more plates having central openings, a slide covering each opening and adjustable longitudinally and rotatably with respect thereto, and a sight-tube carried by each slide.

709,059. ENGINE-GOVERNOR. HENRIK G. STRAND, Chicago, Ill. Filed Dec. 27, 1899. Renewed Feb 20, 1902. Serial No. 94,926. (No model.)

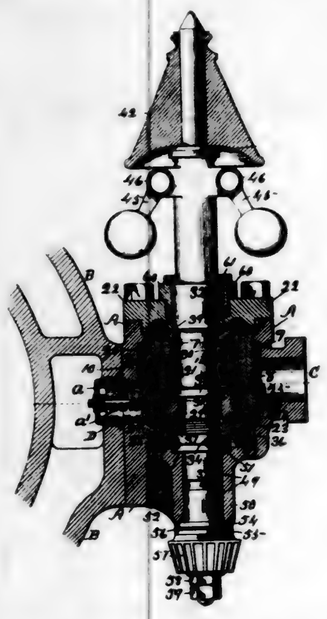
Claim.—1. In a device of the kind described, the combination of the governor-casing, the stationary valve-lining, inclosed thereby and provided with receiving and discharge ports, the governor-valve, loosely seated inside of said lining and having corresponding receiving and discharge ports, means for actuating the governor-valve in varying the area of the port-openings, the direct passage, between said valve and the engine-cylinder, and the check-valve located in and controlling said passage.

2. In a device of the kind described, the governor-casing, the lining inclosed by said casing and held in a rigid position and provided with receiving and discharge ports, the discharge-ports being located opposite each other and at right angles to the passage leading into the engine-cylinder, the spaces, between said casing and lining on the receiving and discharge sides respectively, the governor-valve, seated loosely inside of said lining and provided with receiving and discharge ports corresponding to the ports therein, the means substantially as described for actuating the governor-valve in regulating the admission of the motive agent, and the check-valve, located in and automatically controlling the passage between the governor-valve and engine-cylinder.

3. In a device of the kind described, the governor-casing, the stationary valve-lining, provided with receiving and discharge ports with corresponding spaces between said casing and lining, the double-walled governor-valve, having an annular chamber and loosely seated in place and the means described for actuating and controlling the movement of said valves in regulating the supply of gas or other motive fluid.

4. In a device of the kind described, the casing, the stationary lining, inclosed thereby, the governor-valve, loosely seated on the inside of said lining and both being provided with receiving and discharge ports so disposed that a solid wall is presented on the side adjacent to the passage leading into the engine-cylinder, and the check-valve, located in said passage and automatically controlling the flow of the motive agent therethrough.

5. In a device of the kind described, the combination of the casing, the valve-lining, provided with receiving and discharge ports, the cap, holding the lining in a stationary position, the governor-valve, seated loosely on the inside of its lining and provided with corresponding ports, means for preventing a rotary movement of said valve, and the annular space between said lining and casing on both the receiving and discharge sides.



6. In a device of the kind described, the double-walled governor-valve, having the lower end of the inner wall stop short of the corresponding end of the outer wall and is thickened to form an annular shoulder, the vertically-reciprocating sleeve, provided with a flange engaging the shoulder on the valve, the governor-spindle, provided with a flange on which the sleeve loosely rests, the nut, having a screw-threaded engagement with the lower end of the sleeve, the ball-bearing between said valve and sleeve, and means for imparting a vertical movement to said sleeve in controlling the movement of the governor-valve.

7. In a device of the kind described, the combination with the governor-valve of its inclosing lining, provided on the lower end with an inturned flange on which the lowermost ends of said valve seats when in the lowest position and supports the same out of contact with its ball-bearing and providing space for the lubricant to reach said bearing.

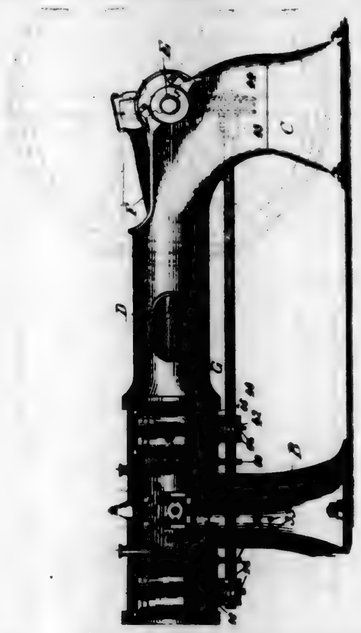
8. In a device of the kind described, the combination of the casing, the stationary lining, having ports therethrough, the governor-valve having corresponding ports, the governor-spindle, the sleeve, inclosing said spindle and having both a rotary and endwise movement, and the weighted governor-arms, pivoted to said sleeve and engaging loosely with said spindle at a point above the governor-valve.

9. In a device of the kind described, the governor-valve, having double walls with an annular chamber therebetween and having receiving and discharge ports in the exterior wall only, the sleeve, inclosed by said valve and having an operative connection therewith, and the spindle, inclosed by said sleeve having both a rotary and an endwise movement thereon.

10. In a device of the kind described, the casing, having a contracted lower part, the bearing-bushing, provided with flanged ends, the governor-spindle, provided with a flange adjacent to the upper flanged end of the bushing, the bearing-collar, mounted on said spindle under the lower end of said bushing, the bearing-balls, inserted between said parts, and the adjusting screw-cone, threaded on the lower end of said spindle.

11. In a device of the kind described, the combination of the stuffing-box gland, having an oil-chamber with an oil-passage leading therefrom, the governor-spindle, provided with an annular and vertical oil-grooves, the sleeve, inclosing said spindle, and the series of ball-bearings, lubricated from said oil-passages.

709,060. FOUR-CYCLE EXPLOSIVE-ENGINE. HENRIK G. STRAND, Chicago, Ill. Filed Feb. 15, 1899. Renewed Feb. 20, 1902. Serial No. 94,927. (No model.)

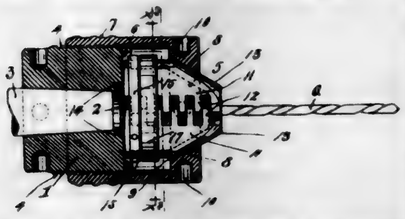


Claim.—1. In a gas-engine, the double-action cylinder, the double-valve chest at each end of said cylinder and the supply and separate exhaust valves in said cylinder with means for actuating said valves, a mixing-chamber and passages extending from it to the valve-chambers at the respective ends of the cylinder, substantially as described.

2. In a gas-engine, the horizontal cylinder, the double-acting piston therein, the valve-chest at each end of said cylinder, each valve-chest having an inlet and exhaust valve and means for operating the same, a mixing-chamber and passages extending from it to the valve-chambers at the respective ends of the cylinder, substantially as described.

3. In a gas-engine, the governor, the governor-valve, inserted loosely in its seat, the casing inclosing said valve, the lining interposed between said valve and its casing, said lining having ports as described, and a sleeve having a reciprocating and rotary motion and adapted to move the governor-valve either upwardly or downwardly, substantially as described.

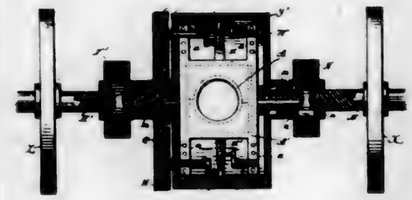
709,061. DRILL-CHUCK. ALBERT J. STENSGAA, Minneapolis, Minn. Filed Mar. 20, 1902. Serial No. 98,089. (No model.)



Claim.—1. In a drill-chuck, the combination with the head 1 screw-threaded at and provided with the integrally-formed cheek-pieces 5 and the abutting surface 6, which cheek-pieces 5 are spaced inward from said threads and are tapered at their outer ends, of the jaws 11 tapered at their outer ends and working between said cheek-pieces with their inner ends abutting against said abutting surface, the clamping-collar 7 engaging the screw-threads 4 of said head, spaced apart from said cheek-pieces to form an annular space and provided at its outer end with the conical seat 9 engaging the tapered ends of said jaws, and a spring extended circumferentially in said annular space and connected to both of said jaws and tending to separate the same, substantially as described.

2. In a drill-chuck, the combination with the head 1 having integrally-formed cheek-pieces 5 abutting the surface 6, of the jaws 11 tapered at their outer ends and working freely between said cheek-pieces with their inner ends abutting against said abutting surface, the pair of springs 17 embracing the opposite cheek-pieces 5 and attached at their ends to the said pair of jaws and tending to separate the same with a straight-line force, and a clamping-collar 7 screw-threaded onto said head 1 and provided at its outer end with the flange 8 having the conical seat 9 engaging the tapered ends of said jaws, substantially as described.

709,062. STEAM-ENGINE. NICHOLAS J. VERBIT and HENRY H. RAMSTAD, Little Rock, Ark. Filed Aug. 10, 1901. Serial No. 71,554. (No model.)



Claim.—1. In a steam-engine, the combination, of a cylinder, shafts connected to said cylinder, pistons working in the cylinder, pinions geared to said pistons, a gear-wheel over which the pinions travel, and means for regulating the turning of the gear-wheel and holding it stationary, substantially as shown and described.

2. In a steam-engine, the combination, of the cylinder, shafts connected to the sides of said cylinder, pinions geared to the pistons of the cylinder, a gear-wheel over which the pinions travel, and a friction-band engaging said gear-wheel; together with valve mechanism for the cylinder, substantially as shown and described.

3. In a steam-engine, the combination, of the cylinder, shafts connected to the sides of the cylinder, pistons working in the cylinder in opposite directions with their piston-rods projecting through the ends of the cylinder, cross-heads connected to the ends of the piston-rods, double-crank shafts connected to the cross-heads, pinions on the crank-shafts, a gear-wheel over which the pinions travel, and means for holding said gear-wheel stationary, substantially as shown and described.

4. In a steam-engine, the combination, of the cylinder, shafts connected to the sides of the cylinder, pistons working in the cylinder, cross-heads connected to the ends of the piston-rods, crank-shafts mounted on the cylinder and connected to the cross-heads, pinions on the crank-shafts, a gear-wheel over which the pinions travel and a brake for said gear-wheel, substantially as shown and described.

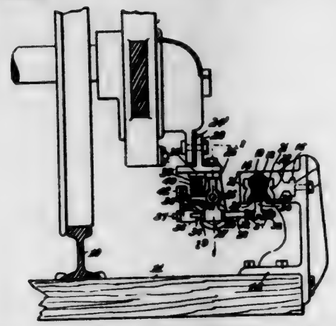
5. In a steam-engine, the combination, of the cylinder, shafts connected to the sides of the cylinder, pistons working in the cylinder, cross-heads connected to the ends of the piston-rods, double-crank shafts to which the cross-heads are connected, pinions on said shafts, a gear-wheel over which the pinions travel, and a friction-band engaging said gear-wheel, substantially as shown and described.

6. In a steam-engine, the combination, of the cylinder, shafts connected to the sides of the cylinder, pistons working in the cylinder, crank-shafts mounted on the cylinder and connected to the piston-rods, pinions on said crank-shafts, and a gear-wheel over which the pinions travel; together with means for holding the gear-wheel stationary, substantially as shown and described.

7. In a steam-engine, the combination, of the cylinder, shafts connected to the sides of said cylinder, pistons working in the cylinder, double crank-shafts mounted on the cylinder, cross-heads attached to the piston-rods and connected to the double-crank shafts, pinions on said crank-shafts, a gear-wheel over which the pinions travel, and a friction device engaging the gear-wheel, substantially as shown and described.

8. In a steam-engine, the combination, of the cylinder having steam and exhaust passages around the same, hollow shafts connected to the sides of the cylinder to conduct the steam to and from the same, and slide-valves through which the steam is admitted to and from the cylinder; together with the pistons, crank-shafts connected to the piston-rods, pinions on said crank-shafts, and a stationary gear-wheel over which the pinions travel, substantially as shown and described.

709,063. ELECTRIC-RAILWAY SYSTEM. LOUIS R. WALKER, Springfield, Mass., assignor, by direct and mesne assignments, to Ed. Wilson Farnham, Chicago, Ill. Filed Dec. 2, 1901. Serial No. 84,208. (No model.)



Claim.—1. In a third-rail system, the combination with a car, of a support rotatably mounted thereon, a lever pivoted upon the support, a member movably mounted upon the lever, and a contact-shoe carried by the member and longitudinally movable thereon.

2. In a third-rail system, the combination with a car, of a contact-shoe, a rotatable and revolvable carrying member for said shoe, and an actuating-lever connected to the carrying member and longitudinally movable thereon.

3. In a third-rail system, the combination with a car, of a contact-shoe, a rotatable and revolvable carrying member for said shoe provided with a projection, and an actuating-lever upon the carrying member provided with a slot into which the projection on the carrying member stands.

4. In a third-rail system, the combination with a car, of a support swiveled thereon, a lever pivoted upon the support, a rod extending through an opening in the lever, a contact-shoe carried by the rod, and an actuating-lever mounted upon the rod.

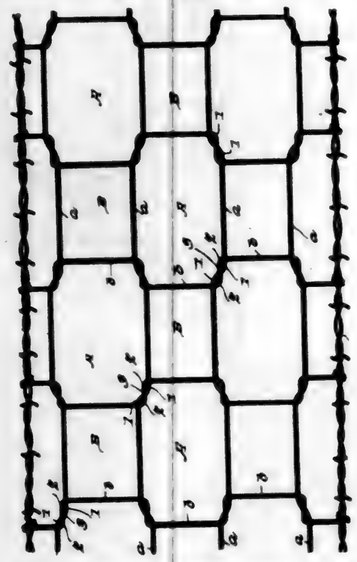
5. In a third-rail system, the combination with a car, of a support swiveled thereon, a lever pivoted upon the support, a rod extending through an opening in the lever, a contact-shoe carried by the rod, a lever mounted upon the rod, and a power-actuated piston connected with the lever.

709,064. PIPE-WRENCH. ERASTUS A. WARE, Hoosic, Conn., assignor of one-half to Michael B. McDonald, Hoosic, Conn. Filed June 12, 1901. Serial No. 64,326. (No model.)

Claim.—1. A device of the class described, comprising a body portion provided at one end with a handle and adjacent to the other end with a transverse curved recess the outer portion of which forms a hooked serrated jaw and intermediate such handle and jaw with a slot extending through said body portion in the plane of such recess, and a rotary jaw eccentrically mounted in such slot and provided with a serrated periphery which is so curved from a predetermined point that it constantly recedes from the bearing-pin until a point is reached approximately in line with the starting-point and the bearing-pin, the periphery between the initial and terminal points forming an inwardly-curved smooth shoulder.

2. A device of the class described, comprising a body portion embodying two parallel side pieces provided near one end with a transverse recess on one side the outer end portion of which forms a hooked serrated jaw and at the other end secured to a portion inserted between such side pieces to form a handle, and a rotary jaw eccentrically mounted between such side pieces intermediate the hooked jaw and the handle, and provided with a serrated periphery which is so curved from a predetermined point that it constantly recedes from the bearing-pin until a point is reached approximately in line with the starting-point and the bearing-pin, the periphery between the initial and terminal points forming an inwardly-curved smooth shoulder.

709,065. WOVEN-WIRE FENCE FABRIC. EUGENE I. WARNER, Waverly, Kans. Filed Feb. 3, 1902. Serial No. 92,455. (No model.)



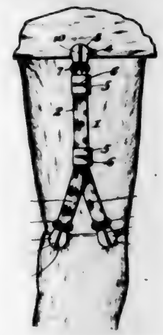
Claim.—1. A woven-wire fence fabric composed of continuous running-wires, and cross-wires, each offset alternately in opposite directions at the points of intersection, said running and cross wires having their respective offset portions twisted together to form rectangular meshes, substantially as described.

2. A woven-wire fence fabric composed of running-wires and cross-wires, each at suitable regular intervals being bent to form reversely-disposed lateral offsets, the distances between the respective horizontal and respective vertical reaches of the running and cross wires intermediate of the offset portions thereof being varied alternately and the said lateral offsets of said running and cross wires intersecting each other and being twisted together to prevent slipping and to form meshes of two sizes, the larger meshes alternating with the smaller, both longitudinally and transversely of the fabric, substantially as described.

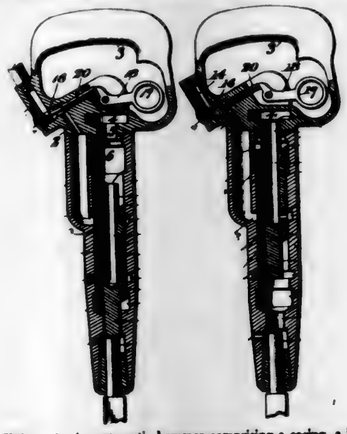
709,066. STOCKING-SUPPORTER. ELIZABETH H. WATERMAN, Binghamton, N. Y. Filed Oct. 24, 1901. Serial No. 79,226. (No model.)

Claim.—1. In an improved stocking-supporter, clasps adapted to secure said stocking-supporter to the waist and to the stocking, said clasps each comprising a loop, jaws passed through the loop and having flat contact-surfaces, a pad of yielding material secured on the inner surface of one of said jaws, and spring-arms substantially parallel to each other, said arms passing through said jaws outside of the loop and riding over said jaws and adapted to press them together.

2. In an improved stocking-supporter, a clamping member embodying jaws having flat contact-surfaces and adapted to be passed through a loop on said supporter, a pad secured to the inside of one of said jaws, and a substantially U-shaped spring-arm passing through said jaws adjacent to said loop and adapted to ride over said jaws and press them together.



709,067. VALVELESS HAMMER. DANIEL S. WAGER, Chicago, Ill. Filed Nov. 30, 1900. Serial No. 38,902. (No model.)



Claim.—1. An automatic hammer comprising a casing, a hammer movable therein, means for directing a fluid-pressure against a reduced area of the hammer during its initial movement and against the whole pressure area during the remainder of its movement in one direction, and means supplemental to the normal exhaust for relieving the compression opposed to the hammer during the final portion of its movement in the opposite direction.

2. In a fluid-operated hammer, the combination with a casing having means for admitting and exhausting motive fluid, of a plunger or hammer fitted within the casing for reciprocation by pressure of the motive fluid therein, means for reducing the pressure area of the hammer during the initial portion only of the movement of the hammer in one direction, and means for relieving the compression opposed to that portion of the pressure area defined by such reduction, said relief being effected during the final portion only of the return movement of the hammer.

3. In a fluid-operated hammer, the combination with a casing, a hammer movable therein and a primary compression-chamber defined in part by a reduced pressure area of the hammer, of an auxiliary compression-chamber defined in part by a separate pressure area of the hammer, means for exhausting the motive fluid from both compression-chambers, and means for subsequently relieving the compression within the auxiliary compression-chamber.

4. A fluid-operated hammer comprising a casing, a hammer movable therein, and means for admitting the motive fluid to the interior of the casing to operate the hammer, of means for exhausting the motive fluid opposed to the movement of the hammer in one direction, and a relief-port in the hammer for subsequently relieving the compression caused by such movement of the hammer.

5. A fluid-operated hammer comprising a casing, a hammer movable therein, and means for admitting the motive fluid to the interior of the casing to operate the hammer, of means for exhausting the motive fluid opposed to the movement of the hammer in one direction, and means for subsequently relieving the compression caused by such movement of the hammer, said relief being effective only during the final portion of the stroke and after the termination of the normal exhaust.

6. A fluid-operated hammer comprising a casing, a hammer movable therein and means for admitting the motive fluid to the interior of the casing to operate the hammer, of means for exhausting the motive fluid opposed to the movement of the hammer in one direction, and means controlled by the hammer for relieving the compression produced by such movement of the hammer.

7. A fluid-operated hammer comprising a casing, a hammer movable therein and means for admitting the motive fluid to the interior of the casing to operate the hammer, of means for exhausting the motive fluid opposed to the movement of the hammer in one direction, and a relief-port within the hammer arranged to be uncovered subsequent to the exhaust of the motive fluid, whereby the compression produced by the movement of the hammer subsequent to the exhaust of the motive fluid will be relieved through said port.

8. In a fluid-operated hammer, the combination with a casing provided at one end with a primary compression-chamber having a reduced extension and an auxiliary compression-chamber, of a hollow hammer movable within the casing and provided with a reduced hammer extension designed to fit within the chamber extension in one position of the hammer, and means for relieving the compression within the auxiliary chamber after the hammer extension has entered the extension of the primary compression-chamber.

9. In a fluid-operated hammer, the combination with a casing provided at one end with a primary compression-chamber having a reduced extension and an auxiliary compression-chamber, of a hollow hammer movable within the casing and provided with a reduced hammer extension designed to fit within the chamber extension in one position of the hammer, and a relief-port formed in the hammer and designed, after the hammer extension has entered the chamber extension, to relieve the compression within the auxiliary compression-chamber.

10. In a fluid-operated hammer, the combination with a casing and a hammer mounted for reciprocation therein, of means for subjecting the hammer to fluid-pressure during the initial portion only of its movement in one direction.

11. In a fluid-operated hammer, the combination with a casing and a hammer disposed for reciprocation therein, of means for subjecting the hammer to the action of the fluid motive agent during the entire effective stroke of the hammer, and means for effecting the return stroke of said hammer by subjecting it to fluid-pressure during the initial portion only of such return stroke.

12. In a fluid-operated hammer, the combination with a casing and a hammer mounted for reciprocation therein, of means for reducing the area of the surface of said hammer exposed to the pressure of a motive fluid during the initial portion of its effective stroke and for subsequently increasing such area during the effective stroke of the hammer, means for subjecting the hammer to fluid-pressure during the initial portion only of its return stroke, means for exhausting the motive fluid from behind the hammer to permit such return movement, and means operative subsequent to such exhaust for relieving the compression opposed to the return movement of the hammer.

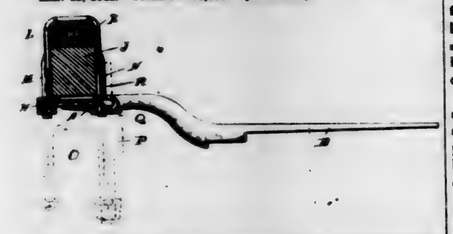
13. In a fluid-operated hammer, the combination with a casing and a hammer mounted for reciprocation therein, of means for reducing the area of the surface of said hammer exposed to the pressure of a motive fluid during the initial portion of its effective stroke and for subsequently increasing such area during the effective stroke of the hammer, means for subjecting the hammer to fluid-pressure during the initial portion only of its return stroke, means for exhausting the motive fluid from behind the hammer to permit such return movement, and means effective only during the final portion of the return stroke of the hammer for relieving the compression produced by and opposed to such return movement.

14. In a fluid-operated hammer, the combination with a casing provided with supply and exhaust ports and having a primary compression-chamber and a return compression-chamber adjacent to its opposite ends, of a fluid-operated reciprocatory hammer within the casing, means for admitting the motive fluid to the primary and return chambers alternately through the hammer, means for exhausting said fluid from one of the chambers through the hammer, and means for effecting the direct exhaust of the other chamber by the initial movement of the hammer in one direction.

15. In a fluid-operated hammer, the combination with a casing provided with supply and exhaust ports, of a reciprocatory hammer within

the casing, said hammer being provided with an axial chamber, a port in communication with said chamber, and a comparatively small return-port, said port and return-port of the hammer being arranged for alternate presentation before the supply-port of the casing.

709,068. VEHICLE-GEAR. FRANK E. WILCOX, Mechanicsburg, Pa., assignor of one-half to L. E. Hickok, Mechanicsburg, Pa. Filed Mar. 15, 1902. Serial No. 98,269. (No model.)



Claim.—1. The combination with the end of a reach-iron having holes E, E, a perforated lug F, and a hole for a king-bolt, of a head-block plate; a head-block; a spring; and a three-pronged clip, the prongs of which pass through holes E, E and the perforated lug F; said reach-iron having adjacent its end a recess C, and said head-block plate provided with a recess I which matches the recess C, whereby the reach-iron and head-block plate interlock and are held together by the clip.

2. The combination with the perforated reach-iron, of a head-block plate; a head-block; a spring; a three-pronged clip L; the said reach-iron having a hole D in the rear of the head-block and head-block plate; a king-bolt E and a king-bolt clip O having perforated lug P located below the reach-iron.

3. The combination in a vehicle-gear, of the reach-iron having the perforated lug F, holes E E, hole D and recess G; a head-block; spring; three pronged clip L; and king-bolt clip O having lug P, and cylindrical bearing Q which engages the recess G; a separate head-block plate being interposed between the head-block and recessed end of the reach-iron.

709,069. VEHICLE-GEAR. FRANK E. WILCOX, Mechanicsburg, Pa., assignor of one-half to L. E. Hickok, Mechanicsburg, Pa. Filed Oct. 12, 1901. Serial No. 78,668. (No model.)

Claim.—1. The combination in a vehicle-gear, of an axle having an integral perforated king-bolt lug in the rear thereof, and lower fifth-wheel end bearing portions separate from the lug and located at opposite sides thereof and formed integral with said axle; an upper fifth-wheel member; a head-block plate; reach-irons; a forked brace provided with a brace-head; and a king-bolt uniting the head-block plate, brace-head, and lug in the rear of the axle.

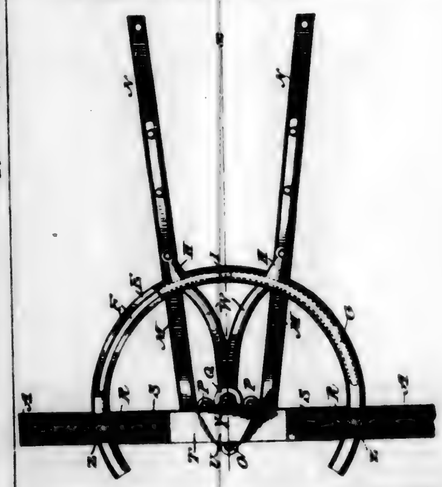
2. The combination in a vehicle-gear, of an axle having an integral perforated lug located in the rear thereof said lug being provided with a recess and a projection, lower fifth-wheel bearings separate from the lug; an upper fifth-wheel member; a head-block plate having a perforated lug; a brace having a perforated head; and a king-bolt; the lug of the head-block plate, axle-lug, and brace-head interlocking, whereby the king-bolt is relieved from severe strains.

3. The combination in a vehicle-gear, of a head-block plate provided with a king-bolt lug; a perforated brace; a king-bolt; an upper circular fifth-wheel member T; and a metallic axle having a perforated king-bolt lug C located in the rear thereof and lower fifth-wheel bearing portions separate from and located each side of and remote from the lug C; said king-bolt lug and bearing portions being formed integral with the body of the axle.

4. The combination in a vehicle-gear, of an axle having an integral and perforated lug C in the rear thereof, lower fifth-wheel bearings each side the lug; an upper fifth-wheel member; a head-block plate having a perforated lug G and a brace-head each interlocking with the king-bolt lug; and a king-bolt provided with means for anchoring the same so it cannot turn relative to the axle.

5. The combination in a vehicle-gear, of an axle; a perforated king-bolt lug integral with the axle; a lower fifth-wheel member of circular shape, the ends being integral with the axle and the remaining portion secured to the said ends; an upper circular fifth-wheel member; a head-block plate with a perforated king-bolt lug; reach-irons; a lower brace; a king-bolt; and means for securing the upper member of the fifth-wheel to the reach-irons; the said king-bolt being passed through the lower brace, axle-lug, and lug of the head-block plate.

709,070. VEHICLE-GEAR. FRANK E. WILCOX, Mechanicsburg, Pa., assignor of one-half to L. E. Hickok, Mechanicsburg, Pa. Filed Feb 17, 1902. Serial No. 94,470. (No model.)



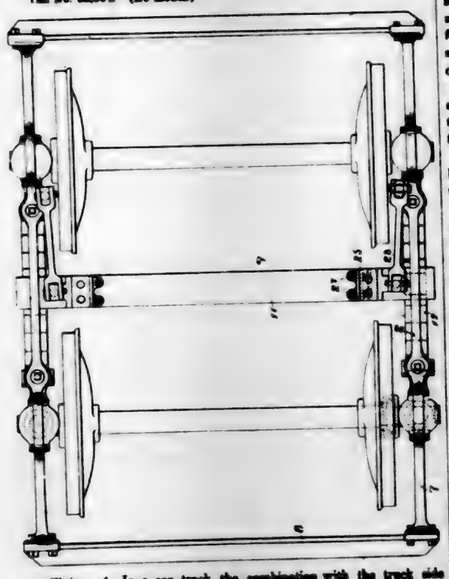
Claim.—1. The combination in a vehicle-gear, of a head-block plate having integral therewith the front perforated lug O and the two rear perforated lugs P, P; a head-block above the plate; a spring resting upon the head-block; a clip having three legs passed through the perforations in lugs O and P, P; and a plate T located between the spring and clip; said plate T having a recess within which is seated the enlarged, flat, top portion of the clip.

2. The combination in a vehicle-gear, of an axle having in the rear thereof and integral therewith a perforated king-bolt lug; a head-block plate having an integral perforated lug Q located above the axle-lug, a front perforated lug O, and two rear perforated lugs P, P; a head-block; a spring above the head-block; a three-legged clip surrounding the leaves of the spring and the head-block and having its legs passed through the perforations in lugs O and P, P; a brace with a perforated brace-head; and a king-bolt passed through the perforations in the lug Q, the axle-lug, and the brace-head.

3. The combination in a vehicle-gear, of an axle having a perforated king-bolt lug at the rear side thereof and integral therewith; a head-block plate having integral therewith the perforated front lug O, rear lugs P, P, and Q, and reach-irons M located outside the lugs P, P; a head-block; a spring; a three-legged clip having its legs passed through the perforations in the lugs O, P, P; a brace with a perforated brace-head; and a king-bolt; said king-bolt being passed through the perforations in lug Q, the axle king-bolt lug, and the brace-head, and the lug Q, king-bolt lug and the brace-head interlocking.

4. The combination in a vehicle-gear, of a metallic axle having at its rear a perforated king-bolt lug B, and a curved lower member of a fifth-wheel E provided with a curved slot F, said member being integral with the axle; an upper fifth-wheel member corresponding in shape with the lower member and provided with a bolt I; a recessed washer J; a spring in the recess of the washer; a nut on the end of the bolt I; a head-block plate having perforated lugs and a perforated lug Q at the rear edge thereof; a brace with a perforated head; a reach-iron; a head-block; a spring; a clip; and a king-bolt passed through lug Q, the king-bolt lug, and the brace-head.

709,071. CAR-TRUCK. WALTER S. ADAMS, Philadelphia, Pa., assignor to John A. Brill, Philadelphia, Pa. Filed Nov. 15, 1901. Serial No. 82,364. (No model.)



Claim.—1. In a car-truck, the combination with the truck side frames, of a bolster, means for supporting said bolster from the side frames, and inextensible means carried by said bolster and connected directly to the side frames for transmitting the draft tension.

2. In a car-truck, the combination with the truck side frames, of a bolster, means for supporting said bolster from said side frames, and an inextensible link carried by said bolster and connected directly to said side frames for transmitting the draft tension.

3. In a car-truck, the combination with the truck side frames, of a bolster resiliently supported from the side frames, and a pivoted inextensible link carried by said bolster and connected directly to the side frame at a point adjacent the pedestal thereof.

4. In a car-truck, the combination with the side frames, links supported thereby, and a semi-elliptic spring supported by said links; of a bolster supported by said spring, and a pivoted link interposed between said bolster and side frames for transmitting the draft tension.

5. In a car-truck, the combination with the side frames, links supported thereby, and a semi-elliptic spring supported by said links; of a bolster supported by said spring, and a universal connection interposed between said bolster and side frames for transmitting the draft tension.

6. In a car-truck, the combination with the truck side frames, links supported from said frames, a semi-elliptic spring having its ends supported by said links, a trussed bolster having extended ends centered upon said elliptic spring, and a pivoted link interposed between said bolster and said side frames.

7. In a truck, the combination with a frame, of a bolster capable of a vertical and horizontal movement, a rub plate or block carried thereby, said block and frame having apertures therein, eye pins or bolts in said apertures, and links forked at each end and connected with said eyepins, whereby a positive connection for the bolster having universal joints is provided.

8. In a car-truck, the combination with the truck side frames, extensible links supported thereby, and semi-elliptic springs supported by said links; of a bolster supported upon the said springs, and a link forming a rigid connection between said bolster and the side frames.

9. In a car-truck, the combination with the side frames, a bolster and means for resiliently supporting said bolster from the side frames; of a link, a pin pivotally connected to one end of said link, and pivotally secured to said bolster, and a pin carried by the other end of said link and secured to the side frame.

10. In a car-truck, the combination with the truck side frames, a bolster, and means for resiliently supporting the same from said side frames, of a forked link, pins pivotally mounted in the forked ends of said link, and means for rotatably securing said pins in said side frames, and to means connected to said bolster.

11. In a car-truck, the combination with the truck side frames, extensible links depending therefrom, a semi-elliptic spring having its ends supported in the ends of said links, a bolster having its ends supported upon said springs, and a wear plate or block carried by said bolster; of a forked link, carrying a pin at one end rotatably secured in an aperture in said block, the other end of said link also carrying a pin rotatably secured in an aperture in said side frames.

12. In a truck, a rub or side-bearing plate having standards, the said standards being split and roughened on their cooperating faces and bolts to secure said split portions together at any point to permit the height of the bearing-plate to be adjusted.

13. In a truck, a frame, a bolster supported thereon, rub plates or blocks secured to the bolster, and means connecting said rub-plates with the frame for draft purposes.

14. In a car-truck, a truck-frame, a bolster flexibly supported thereon, rub blocks or chairs mounted on said bolster one at either end, bars, rods, or links extending one from each block to a point on the frame toward one end thereof, and universal connections of said rods with the bolster and frame.

15. In a car-truck, a frame, a bolster flexibly supported thereon, bearing or rub blocks on each end of the bolster, each being provided with an enlarged base having an aperture therein, the side of the frame in advance of the bolster also having a similar aperture, pins rotatably secured in said apertures, and having eyes in their projecting ends, and rods extending between said pins and connected with said eyes whereby universal joints at the ends of the rods are obtained.

16. In a car-truck, a frame, a bolster comprising a lower plate, and an upper arch-plate, semi-elliptic springs to which the ends of said bolster are bolted, spring extension-links loosely suspended from the upper chord of the frame and supporting the ends of the elliptic spring, rub-plates mounted on said arch-bars and adjustable in height, and bars or rods extending from the said rub-plates to points in advance on the frame and having universal connections at their ends.

17. In a car-truck, the combination with the truck side frames, and means for connecting said side frames at their extremities; of a bolster supported at its ends from said side frames, and a pivoted inextensible link interposed directly between said bolster and side frames for limiting the lateral movement of said bolster.

18. In a car-truck, the combination with the truck side frames, of a bolster supported therefrom, side bearings or wear-blocks carried near the ends of said bolster, and means interposed between said side bearings and the side frames for transmitting the draft tension.

19. In a car-truck, the combination with the truck side frames, extensible links supported thereby, and semi-elliptic springs hung from said links; of a bolster supported upon said springs, side bearings or wear-blocks carried by said bolster, and a link interposed between said side bearings and said side frames.

20. In a car-truck, the combination with the truck side frames, extensible links supported thereby, and semi-elliptic springs hung from said links; of a bolster having its ends resting upon said springs, side bearings or wear-blocks carried by said bolster, and a universal connection interposed between said side bearings and side frames for transmitting the draft tension.

21. In a car-truck, the combination of the truck-frame including side frames, a bolster, semi-elliptic springs suspended from said side frames, supporting said bolster, and links interposed between said bolster and side frames, for transmitting the draft tension to the bolster.

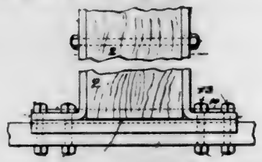
22. In a car-truck, the combination of the truck-frame including the side frames, a bolster, semi-elliptic springs supporting said bolster from said side frames, and a universal connection interposed between said bolster and side frames, for transmitting the draft tension.

23. In a car-truck, the combination of the truck-frame, including side

frames, semi-elliptic springs hung from said side frames, a bolster, and means interposed between said bolster and side frames, for transmitting the draft tension.

24. In a car-truck, the combination of the truck-frame, including side frames, semi-elliptic springs hung from said side frames, a bolster supported by said springs, and a pivoted link interposed between said bolster and side frames.

709,072. **CAR-TRUCK CONSTRUCTION.** WALTER S. ADAMS, Philadelphia, Pa., assignor to John A. Brill, Philadelphia, Pa. Filed Feb. 25, 1902. Serial No. 96,560. (No model.)



Claim.—1. The combination with the cross-bar having a bent end, another bar, and an interposed carrier having flanges extending from its upper and lower edge in opposite directions and vertically disalined, the bent end resting on the flange, the upper flange resting upon the latter bar, and means for detachably securing the bars together, substantially as described.

2. The combination with the spring-plank, cross-bars upon each side thereof having laterally-projecting ends substantially at right angles to said spring-plank, and a cross-bar supporter; of a cross-bar carrier interposed between said cross-bars and cross-bar supporter having a vertical web and longitudinally-disposed separated flanges extending therefrom in opposite directions, one of said flanges resting upon the upper side of said cross-bar supporter, and the lower flange resting beneath and supporting the end of said spring-plank and the outwardly-turned ends of said cross-bars upon each side of said spring-plank.

3. The combination with the spring-plank, and a cross-bar carried upon each side of said spring-plank having laterally-extending ends, and a cross-bar supporter carried by the truck-frame; of a cross-bar carrier interposed between the end of said plank and said support, oppositely-disposed flanges carried by said carrier, the flange upon the top of said carrier resting upon the upper side of said support, and the lower flange resting beneath and supporting the under side of said spring-plank and the laterally-extending ends of said cross-bars, and bolts passing through said cross-bar, cross-bar carrier and support for detachably securing said parts together.

4. The combination with the spring-plank, cross-bars having laterally-projecting ends bolted to each side of said spring-plank, and cross-bar supports carried by the truck-frame; of a flanged carrier interposed between the end of said spring-plank, and the laterally-projecting ends of said cross-bars and said support, and means for detachably securing said parts together.

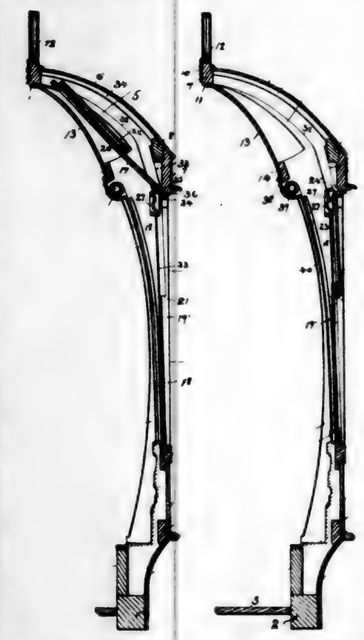
5. The combination with the spring-plank, cross-bars secured to each side of said spring-plank having their ends projecting laterally from said plank in a plane substantially in line with the end of said spring-plank, and means carried by the track for supporting said cross-bars and spring-plank; of a cross-bar carrier having a vertical web interposed between the end of said spring-plank and cross-bars and said support, and oppositely-disposed flanges carried by said web, the upper flange resting upon the upper side of said support, and the lower flange resting beneath and supporting the end of said spring-plank and the laterally-projecting ends of said cross-bars, and bolts passing through said laterally-projecting portions of said cross-bars and through said cross-bar carrier and support for detachably securing said parts together.

709,073. **CONVERTIBLE RAILWAY-CAR.** JOHN A. BRILL and EDGAR S. BUCKMAN, Philadelphia, Pa.; said Buckman assignor to said Brill. Filed Feb. 1, 1901. Serial No. 46,546. (No model.)

Claim.—1. In a car having side openings, and posts to define said openings, the combination with a plurality of movable and separable panels, grooves in the posts to control the up-and-down movements of said panels, and means for automatically locking and unlocking the panels together as they are moved up and down in said grooves.

2. In a convertible car, the combination with grooves or guides in the space between the head-lining and roof, of the separable and inflexible panels each having means connecting its separate groove, the panels being adapted to be independently tilted in an inclined position in the said space and supported therein, and means for automatically locking and unlocking the panels as they are raised and lowered in said grooves.

3. In a car, the combination with posts having roof extensions and oppositely-disposed grooves therein, separate grooves in each of the posts merging into the extension-grooves, a turnout located at the junction of one of the post-grooves and the extension-grooves, separate panels movable in said grooves, and means carried by said panels alternately engaged and disengaged by said turnout.



4. In a car, the combination with the posts having roof extensions, a groove in each of the extensions, openings in the car between the posts, a plurality of panels, stepped supports for the panels and grooves leading from said steps to the extension-groove, the lower panel having a flanged opening, and the upper panel a tongue adapted to engage the opening, and a turnout in the groove for the lower panel located adjacent the union of this latter groove and the extension-groove.

5. In a car having side openings, and posts to define said openings, the combination of a plurality of movable and separable panels, grooves in the posts to control the up-and-down movements of said panels together, and disengaging them from each other as they are moved up and down in said grooves.

6. In a car having side posts and an opening between said posts, of upper and lower panels for closing said openings, engaging members carried by each of said panels, and means for causing said engaging members to automatically lock and unlock during the raising and lowering of said panels.

7. In a car having side openings and roof-spaces, posts to define said openings, separate grooves in the posts, inflexible sectional panels to fill said openings and which are movable in the separate grooves, means to cause the lower section to engage and lock with the upper section when it is raised, whereby lifting the lower section also lifts the said upper section both together into the roof, and means for automatically disengaging them when lowered.

8. In a car having side openings, posts to define said openings, sectional sash-panels, means to cause a lower section to lock with and thereby raise said upper section, and means for automatically disengaging said panels when being lowered.

9. In a car having side openings, posts to define said openings, sectional sash-panels, means to cause the lower section to lock with the upper section when it is raised, and means for automatically disengaging said panels.

10. In a car having side openings, posts to define said openings, sectional sash-panels for said openings, means for freely raising the lower sash-panel for some distance, locking members carried by said upper and lower panels, and means for automatically locking said members, said lower panel thereby engaging and carrying the upper section along with it when pushed up a further distance.

11. A car having side openings, and a laterally-extending roof storage-space, posts defining said openings, separate grooves in the posts leading into said space, sectional panels movable in said grooves to close said openings, and means for automatically locking and unlocking said sections during raising and lowering.

12. In a car having side openings, a roof provided with storage-spaces, sectional sash-panels for said openings, means allowing the lower section to be freely raised for some distance, locking devices carried by said upper and lower panels, and means for locking said members, the lower panel thereby engaging and carrying with it the other section when raised a farther distance and to storage position within the roof-space.

13. In a car having side openings, a roof provided with storage-spaces, posts to define said openings and extending up into said spaces, sectional sash-panels adapted to be stored in said spaces, guiding and folding means for said panels in connection with the posts, and means for interlocking said panels at a predetermined point during the raising of said lower panel, both panels being thereby carried together into the storage-space.

14. In a car having openings, posts to define said openings, grooves or guides, sectional panels for said openings on the posts for said panels, and a turnout or switch in the guides to cause one section to interlock with another in being raised.

15. In a car having side openings, a sectional panel to close said opening, interlocking members carried by said panels adapted to automatically lock and unlock during the raising and lowering of said panels.

16. A car having side openings, posts to define said openings, sectional panels to fill said openings, grooves in the posts for said panels, a curve or turnout in one of said grooves to cause one section to engage with and lift another when it is raised.

17. A car having side openings, posts to define said openings, sectional panels to fill said openings and having trunnions thereon, and posts having grooves for said trunnions, and a curve or turnout in the grooves to cause one section to engage and lift another when the first is raised.

18. A car having side openings, posts to define said openings, a sash-panel consisting of upper and lower sections, said posts having grooves for said panels and turnouts in said grooves to enable the lower section to grasp and carry the upper section when the said lower section is raised.

19. A car having side openings, posts to define said openings, sectional panels to fill said openings and provided with trunnions, said posts having grooves or recessed portions in which said panels fit and slide, and other grooves made in the bottom of said first grooves for the trunnions on the panels, the latter being provided with a turnout to cause one section to engage and lift the other when the first is raised.

20. A car having side openings, posts having separate grooves to define said openings, sectional panels to fill said openings and which are movable in separate grooves, a fixed support in different planes on the posts for each of the sections, projections on one section, the other being provided with a socket, and means to cause said socket and projection to interlock when the lower section is raised whereby the other is lifted and carried along with it and to be disengaged by lowering the sections.

21. A car having side openings, grooved posts to define said openings, sectional panels movable in the grooves to fill said openings, one of said sections being provided with a slotted socket on its perpendicular face, said socket having lips projecting laterally thereof and over the slot, and another section having a projecting lug on its face opposing the slotted face of the other panel, and means for causing said lug and socket to interlock when one section is raised, whereby the other will be lifted and carried with it.

22. In a car having side openings, posts to define said openings, sectional panels to fill said openings, the lower section being provided with a key-slot and the upper with a corresponding projection, trunnions or lugs on the panels, the posts being provided with grooves for said trunnions and having turnouts or curves therein to cause said slot in the lower section to engage with the projection on the upper when said lower section is raised.

23. In a car having side openings, posts to define said openings having grooves therein, sectional panels guided by said grooves to close said openings, said panels being in different planes between the posts, means to cause said sections to automatically interlock, and rise together when the lower section is lifted.

24. In a car having side openings and roof storage-spaces, posts to define said openings having grooves in their opposing faces, sectional panels to fill said openings and guided by said grooves side by side, a turnout or switch in said grooves to cause said sections to interlock when the power is lifted into the roof storage-space.

25. In a car having side openings and roof storage-spaces, posts to define said openings having grooves in their opposing faces, sectional panels to fill said openings and guided by said grooves, means to cause one section to travel alongside the other when it is lifted, locking members carried by said panels, and means formed in said grooves for causing said lower and upper panels to engage to carry the latter into the roof storage-space and sustain it therein.

26. In a car having side openings and grooved posts, a roof providing storage-spaces above said openings and between the posts, upper and lower panels to move in the grooves to close said openings, means carried by said panels and combined with the said grooves to lock the panels together in said storage-spaces, and means for engaging one of the said panels to retain both of said panels in said storage-space.

27. In a car having side openings, and grooved posts, a storage-space formed above the said openings beneath the roof of the car and between said posts, combined with a pair of upper and lower panels adapted to close said openings, and means partly formed by said grooves and by devices carried by said panels for automatically locking the panels together while being raised into said storage-spaces, and means for retaining the panels in said storage-space.

28. In a car, having side openings and posts, and storage-spaces above said openings beneath the roof of the car and between the posts, the said posts defining said openings, grooves in the said side posts extending into the said storage-spaces, upper and lower panels guided by said grooved side posts, means carried by said panels and adapted to co-operate with said grooves for automatically locking said panels together while being raised into the storage-space, and unlocking them while being lowered from said storage-space, and further means for retaining said panels in said storage-space.

29. In a car having side openings, a roof providing storage-spaces above said openings, upper and lower panels adapted to close said openings, means carried by said panels adapted to automatically lock and unlock the panels to and from each other as they enter and leave said storage-spaces and to maintain them locked in said storage-spaces, and further means for engaging one of said panels to retain both of said panels in said storage-space.

30. In a car having side openings, and storage-spaces above said openings beneath the roof of the car, posts defining said openings, upper and lower panels adapted to close said openings, means for automatically locking said panels together while being raised into said storage-space, and a recess adapted to receive the lower end of said lower panel to support both panels in said storage-spaces.

31. In a car having side openings, a roof provided with storage-spaces, posts to define said openings, panels to close said openings, and means whereby the said panels can be lifted into the roof, and a recess formed in one wall of the said space, the lower end of the said panel being grooved to fit within the recess.

32. As a new article of manufacture, a post for cars having a groove therein, and being provided with a turnout or curve in said groove.

33. As a new article of manufacture, a post for cars provided with grooves side by side, one of said grooves being provided with a turnout, substantially as described.

34. As a new article of manufacture, a post for cars having a curved extension and provided with a groove or depression narrow at one end and wide in the curved portion, another groove in the bottom of said first groove and also running into the curved extension.

35. As a new article of manufacture, a post for cars having a curved extension and with superimposed grooves extending up into the curved portion, one being deeper than the other, the deeper groove having two substantially parallel portions, one being provided with a turnout or switch.

36. As a new article of manufacture, a post for cars having a curved extension and with superimposed grooves extending up, into the curved portion, one being deeper than the other, the deeper groove having two substantially parallel legs emerging from a wide portion thereof, said wide portion extending in the curved portion, and one of said legs having a turnout therein, and still another groove in the other edge of the same face of the post.

37. In a car having side openings, and storage-spaces above said openings below the roof of the car, of side posts defining said openings, upper and lower panels fitted between said posts, interlocking devices carried by said upper and lower panels, adapted to automatically lock and unlock during the raising and lowering of said panels, and a recess in said storage-space adapted to support the lower end of one of said panels.

38. In a car having side openings, and storage-spaces above said openings below the roof of the car, of grooved side posts defining said openings, upper and lower sashes fitted into the grooves of said side posts, locking members carried by said sashes, and means for automatically engaging and disengaging said locking members during the raising and lowering of said panels.

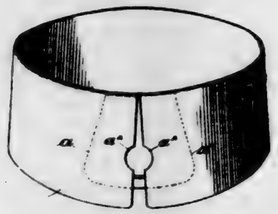
39. In a convertible car having side openings extending down to the belt-rail, sectional sash-panels to close said openings, stationary panels to close the sides of the car below the belt-rail, means to store said sectional panels in the roof, and a curtain-roller journaled between said posts.

40. The combination with the sash or panels, of a key-slot formed in the upper edge of one panel, and a projection from the other panel adapted to engage the slot in the other panel.

41. The combination with the sashes or panels, of a key-slot 28, having narrowing projections 31 formed on one of the panels, and a projection 29 having the overhanging portions 30 formed on the other panel for engagement with said slot.

42. In a convertible open and closed car, the combination of a sliding window-sash and panel, one of said parts being formed with an engaging device to hold the other part thereto when the parts are brought together with one part overlying the other.

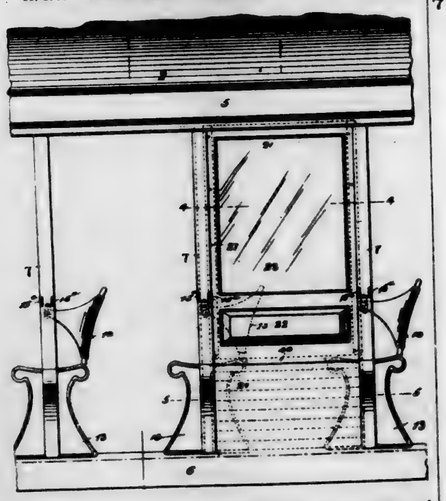
709,074. COLLAR. EDWIN F. BROWN, Chicago, Ill. Filed June 5, 1902. Serial No. 110,319. (No model.)



Claim.—1. In a turn-down collar the outer fold thereof provided in its end with a recess to receive the knot of the tie.

2. In a turn-down collar the outer fold thereof provided in each end with a recess to receive the knot of the tie.

709,075. CONVERTIBLE RAILWAY-CAR. EBEN S. BUCKHAM, Philadelphia, Pa., assignor to John A. Brill, Philadelphia, Pa. Filed Dec 16, 1901. Serial No. 86,019. (No model.)



Claim.—1. In a car, the combination with the posts, grooves formed in the posts, of a window sash or frame, and means adapted to be detachably secured to the frame or sash and inserted into said grooves for detachably securing the sash or frame to the posts.

2. In a car, the combination with the side posts having grooves formed therein, of a sash adapted to fit between said posts, and strips carried by said sash fitting into said grooves to removably secure said sash between said posts.

3. In a car, the combination with the grooved side posts, of a sash fitting between said posts and detachably secured in position by extensions removably secured upon the vertical edges of said sash, adapted to fit into said grooved side posts.

4. In a car, the combination with the posts, grooves formed in said posts, of a window frame or sash, and separable strips adapted to be secured detachably to the sash or frame and inserted in the grooves, substantially as described.

5. In a car, the combination with the posts, grooves formed in said posts, of means for closing the openings between the posts comprising a window frame or sash; separable strips adapted to be detachably secured to the sash or frame and inserted in the grooves, and a panel adapted to be detachably secured in the car side below the said sash or frame.

6. The combination in a car having posts or stanchions provided with opposing grooves, of a sash or frame, separable strips adapted to be inserted in said grooves and secured to the sides of the sash, and a lower panel secured to the car side, substantially as described.

7. In a car, the combination with the lower panel, the upright posts having grooves above the panel, the window sash or frame, the strips inserted in the grooves and secured to the sash, said strips being adapted to rest upon the top of the lower panel, the lower edge of the sash overlapping the upper edge of the panel, the panel and sash being secured together at the overlapping point.

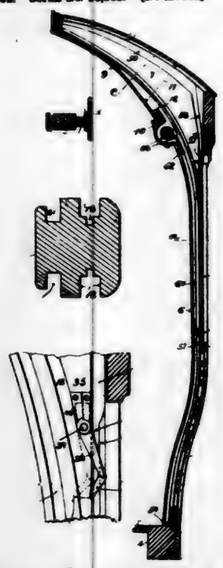
8. The combination with the grooved posts, the lower panel, the window-sash, the strips inserted in the grooves and resting on the lower panel, and means for detachably securing the strips to the sash.

9. The combination in a car having grooved posts, of the lower panel, the window-sash having a recess at its upper cross member, a letter-board extending along the post below the roof, its lower edge being adapted to enter into the said recess, and means for detachably securing the window-sash to the posts and the lower panel.

10. In a car, the combination of posts having grooves, of a lower panel comprising a plurality of longitudinally-disposed strips, an outer flexible covering supported in said grooves, and a window sash or frame detachably secured between the posts and to the upper strip of said lower panel.

11. In a car, the combination with the posts having grooves, the seat-panel having exterior grooved ribs, the grooves in the ribs alining with the grooves in the posts, a panel in said seat-panel grooves comprising a flexible sheet and a series of transverse strips supported in said grooves, and a window sash or frame detachably secured to the posts and to the seat-panel.

709,076. CONVERTIBLE RAILWAY-CAR. EBEN S. BUCKHAM, Philadelphia, Pa., assignor to John A. Brill, Philadelphia, Pa. Filed Jan. 21, 1902. Serial No. 90,585. (No model.)



Claim.—1. In a car, the combination with the posts and the roof-pockets, of a groove formed in the sides of the posts and diverging into separate grooves at or adjacent to the entrance of the pockets, and which separate grooves extend within said pockets, a plurality of elements for closing the car side movable in said groove, and a switch for diverting the separate side-closing elements into the diverging branches of said groove, substantially as described

2. In a car, the combination with the posts having the groove 12 formed in their faces, the roof-pocket, the said groove entering said pocket, the groove 13 formed at the base of the groove 12 and diverging therefrom at and into the pockets, the flexible lower panel movable in the groove 12, the sash comprising two parts hinged together and having trunnions extending outwardly therefrom, the said trunnions moving in the groove 13, and a switch at the point of divergence of the groove 12 from the groove 13, for diverting the trunnions into the roof portion of said groove, and the flexible panel into the roof-section of the groove 13, substantially as described.

3. In a car, the combination with the roof-pockets having grooves converging to a single groove on the post, the separable sash and panel movable in the grooves, a switch comprising an arm provided with a divergent tongue located at the convergence of said grooves, and a spring for resisting the movement of said arm, substantially as described.

4. In a car, the combination with the posts, the roof-pockets, the grooves 12, 13 formed in the pockets, and a switch comprising an arm having a divergent tongue with a stepped face disposed in the path of the groove 12, and extending across the groove 13, and a spring operating against the other end of the arm to maintain it in the before-stated position, combined with a plurality of separable side-closing elements adapted to be diverted into the separate grooves by said switch.

5. The combination in a car-panel, of the upper and lower cross-bar, and a plurality of flexible sheets secured to said cross-bars, one of said sheets being loosely secured to one of said cross-bars.

6. A flexible car-panel comprising the upper and lower cross-bars, an exterior sheet of flexible self-supporting material extending between the cross-bars on one side, and a like sheet extending between the cross-bars on the other side, and secured to one cross-bar, and loosely attached to the other.

7. A flexible car-panel comprising the upper and lower cross-bars, the outer sheet secured to the top and bottom cross-bar, and a sheet secured to the upper cross-bar, and loosely receiving the lower edge of the latter sheet.

8. In a car-panel, the combination with the two sheets, the interposed top and bottom cross-bars, one of the sheets being loosely connected with one of the cross-bars at the lower edge of said sheet.

9. In a car-panel, the combination with the parallel sheets, the interposed top and bottom cross-bars, one of said sheets being loosely secured to one of said bars, and a series of slats secured to one of said sheets, and laterally disposed between them.

10. In a car-panel, the combination with the parallel sheets, the interposed top and bottom cross-bars, and lateral slats interposed between the sheets, some of said slats being secured to either of the said sheets, and disconnected from the other sheet.

11. In a car-panel, the combination with the parallel and juxtaposed sheets, of the interposed top and bottom cross-bars, and the interposed lateral slats secured to one of said sheets and free as to the opposing sheet.

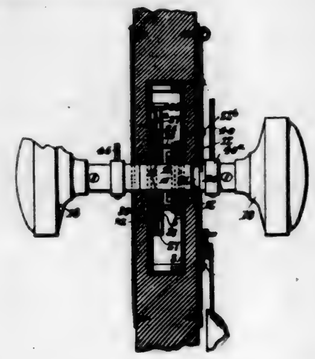
12. In a car-panel, the combination with the parallel juxtaposed sheets, of the interposed top and bottom cross-bars, the slats arranged in pairs, each pair of slats being secured to one sheet and free as to the other, and another slat interposed between each pair and secured to the latter sheet and free as to the former sheet.

709,077. CLEANER FOR BURNER-TIPS. SVEN CARLSEN, Stockholm, Sweden. Filed Feb. 15, 1902. Serial No. 94,573. (No model.)

Claim.—An improved cleaning device comprising a needle-carrying arm, and a rocking arm to which the said needle-carrying arm is pivoted, said rocking arm having movement to carry the needle-carrying arm laterally to the burner and to move the needle-carrying arm longitudinally to thrust the needle into the burner-orifice, substantially as described.

709,078. COMBINATION-LOCK. WILLIS J. CARROLL, Cripple-creek, Colo. Filed Oct. 3, 1900. Serial No. 31,956. (No model.)

Claim.—1. In a permutation-lock of the single-spindle type, the combination with a single rotary and endwise-shiftable spindle extending entirely through the lock for actuation from either side thereof, a bolt, and tumbler mechanism in effective relation to the bolt, of means for effecting the operative connection of the spindle with the bolt or tumbler mechanism through the endwise movement of the spindle, and means for locking the spindle against such endwise movement to prevent the shifting of the spindle from one side of the lock.



2. In a permutation-lock of the single-spindle type, the combination with a single rotary and endwise-shiftable spindle extending entirely through the lock for actuation from either side thereof, of a bolt and tumbler mechanism in operative proximity, means for effecting the operative connection of the spindle with the bolt or tumbler mechanism through the endwise movement of said spindle, and a sliding detent exterior to the lock and engaging the spindle to prevent the endwise movement thereof whereby the manipulation of the lock will be under the control of a person at one side of the door, but will be impossible by a person at the other side thereof.

3. In a permutation-lock, the combination with a rotary and endwise-shiftable spindle, of a bolt and tumbler mechanism, a sounder, and a sounder-operating device mounted for movement into, or out of operative relation with, the sounder through the endwise movement of the spindle.

4. In a permutation-lock, the combination with a rotary and endwise-shiftable spindle, a bolt, and a plurality of tumblers, of means for effecting an operative connection of the spindle with the bolt or tumblers when said spindle is shifted in opposite directions, a sounder designed to indicate the initial position of the tumbler preparatory to the working of the known combination, and operating means presented in operative relation with the sounder when the bolt is shifted into operative relation with the tumblers.

5. In a permutation-lock, the combination with a spindle and bolt, of a plurality of tumblers, means for audibly indicating the extent of movement of the tumblers, a shiftable element for effecting an operative connection between the several tumblers, a sounder, and a trip device mounted upon the spindle exterior to the lock and arranged to actuate the sounder for the purpose of indicating the initial position of the tumbler mechanism preparatory to the working of a known combination whereby the trip device carried by the spindle is exposed to the view of the operator and serves first to indicate the initial position of the tumbler by sounding the alarm, and then indicates the extent of movement of the spindle from its initial position.

6. In a permutation-lock, the combination with a spindle and bolt, of a plurality of peripherally-notched tumblers mounted upon the spindle and arranged to control the movement of the bolt, individual click-springs in operative relation to the periphery of each tumbler, a shiftable member carried by one tumbler and arranged for operative connection with the next adjacent tumbler in a predetermined relative position of the parts, a sounder, and a shiftable finger mounted upon the spindle exterior to the lock and arranged to operate the sounder when the tumblers have assumed predetermined relative positions, said finger being exposed to the view of the operator to indicate the progressive position of the spindle from the starting-point.

7. In a permutation-lock, the combination with a spindle and a bolt having a fixed tongue, of a plurality of tumblers provided with peripheral notches and bolt-slots, individual click-springs engaging the peripheries of the tumblers for the reception of said tongue, a shiftable member serving to operatively connect the tumblers, a shiftable finger movable with the spindle and mounted thereon exterior to the lock, and a sounder embodying a striker having a trip-arm located in the path of the finger when the spindle is shifted endwise to one position.

8. In a permutation-lock, the combination with the tumblers, of a spring secured to one tumbler and having a free end, and a pin or projection extending from another tumbler into the path of the free end of

said spring to effect the operative connection of the tumblers when rotated in one direction only.

9. In a permutation-lock, the combination with a spindle and bolt, of a bolt-operating disk carried by the spindle, said bolt-operating disk being provided with pins engaging the bolt and with a circular series of projections extending from its opposite face, tumbler mechanism loosely carried by the spindle and in effective relation with the bolt, and diametrically-opposed fingers carried by the spindle and arranged for engagement with the tumbler mechanism or with the teeth of the bolt-operated disk.

10. In a permutation-lock, the combination with a spindle capable of rotary and endwise-shiftable movement, of a bolt, a bolt-operating disk and tumbler mechanism mounted upon the spindle in spaced relation, and an engaging device carried by the spindle between the bolt-operating disk and tumbler mechanism to permit the independent rotation of the spindle or to be engaged with either the disk or tumbler mechanism by the endwise-shiftable movement of the spindle.

11. In a permutation-lock, the combination with a rotary and endwise-shiftable spindle, a bolt, and a bolt-operating disk mounted upon the spindle to one side of the bolt, tumbler mechanism mounted upon the spindle, the elements of said tumbler mechanism being operatively connected by a shiftable element, and a finger upon the spindle, said finger being located between the disk and tumbler mechanism to permit the independent rotation of the spindle, and means for effecting the engagement of said finger with the disk and tumbler mechanism by endwise-shiftable movement in opposite directions of the spindle.

12. In a permutation-lock, the combination with a rotary and endwise-shiftable spindle, of a bolt-operating disk carried by the spindle and having operative engagement with the bolt, and a plurality of rotary tumblers loosely mounted upon the spindle, a finger extending from the spindle at a point intermediate of the tumblers and bolt-operating disk, means for effecting the engagement of said finger with the disk and tumblers through the endwise movement of the spindle, and means for maintaining the spaced relation of the bolt-operating disk and the adjacent tumbler to permit the independent rotation of the spindle with the finger out of engaging relation with both the disk and tumblers.

13. In a permutation-lock, the combination with a rotary and endwise-shiftable spindle, of a bolt, a bolt-operating disk and tumbler mechanism carried by the spindle, spacing-pins intermediate of the disk and tumbler mechanism, and fingers mounted upon the spindle for engagement with either the disk or tumbler mechanism through the endwise movement of the spindle, or with neither of said elements to permit the independent rotation of the spindle.

14. In a permutation-lock, the combination with a rotary and endwise-shiftable spindle provided with an annular groove, of a bolt and tumbler mechanism, means for effecting an operative engagement between the spindle and the bolt or tumbler mechanism through the endwise movement of said spindle, a slotted detent arranged for engagement with the groove of the spindle, said slot being provided with lateral offsets, and detent-retaining devices located within the slot of the detent and designed to engage the offsets to retain the detent in one position.

15. In a permutation-lock, the combination with a rotary and endwise-shiftable spindle, of a bolt and tumbler mechanism, means for effecting an operative engagement between the spindle and the bolt or tumbler mechanism through the endwise movement of said spindle, a sounder, and a finger movable with the spindle and designed by the endwise movement of the latter to be presented in operative relation to the sounder, whereby the rotation of said spindle, after each endwise movement, will cause the finger to operate the sounder.

16. In a permutation-lock, the combination with an endwise-shiftable spindle and bolt, of a plurality of tumblers, a shiftable element for effecting an operative connection between said tumblers, means for connecting the spindle with one of the tumblers, a dial, and an index-finger carried by the spindle and movable over the face of the dial to indicate the positions of the tumblers, said finger serving to indicate the endwise positions of the spindle, as well as the rotary positions thereof.

17. In a permutation-lock, the combination with a spindle and bolt, of a plurality of tumblers, a shiftable element for effecting an operative connection between said tumblers, a dial, an index-finger movable with the spindle and over the dial, means for adjusting the position of the finger with respect to the spindle, and a sounder operatively related to said finger.

18. In a permutation-lock, the combination with a casing and dials at opposite sides thereof, of a spindle and bolt, a plurality of tumblers, means for operatively connecting said tumblers with each other and with the spindle, index-fingers carried by the spindle and movable over the faces of the dials, a striker located exterior to the lock and provided with a trip-arm located in the path of one of the fingers, and a sounder in operative relation with the striker.

19. In a permutation-lock, the combination with a rotary and shiftable spindle, a bolt and tumbler mechanism, of a sounder, and a finger adjustable to various radial positions upon the spindle and movable therewith into or out of operative relation with the sounder.

20. In a permutation-lock, the combination with a rotary and endwise-shiftable spindle, a bolt and tumbler mechanism, of a sounder, and a finger adjustable to various radial positions upon the spindle and shiftable by the endwise movement thereof into or out of operative relation with the sounder.

21. In a permutation-lock, the combination with a casing, of a rotary and endwise-shiftable spindle extending entirely through the casing and projecting beyond opposite sides thereof, of tumbler mechanism and a rotary bolt-actuator both mounted directly upon the spindle within the casing, a bolt engaged by the actuator and having a fixed tongue directly obstructed by the tumbler mechanism when the latter is unset, and means for effecting the operative connection of the spindle with the tumbler mechanism or bolt-actuator through the endwise movement of said spindle, said means being normally free from the tumbler mechanism and bolt-actuator.

22. In a permutation-lock, the combination with tumbler mechanism and a bolt controlled thereby, of a spindle and means for operatively connecting the spindle with either the bolt or tumbler mechanism or with neither of said elements as desired.

23. In a permutation-lock, the combination with a casing, a rotary and endwise-shiftable spindle extending through the casing and provided with operating devices beyond each side thereof, a bolt, tumbler mechanism, and an actuator in operative aggroupment, means for effecting an operative connection between the spindle and either the tumbler mechanism or bolt-actuator through the endwise movement of said spindle, and means disposed beyond one side of the casing for locking the spindle against such endwise movement when desired, whereby the spindle when unlocked may be operated from either side of the casing and when locked will be under control from one side only of the casing.

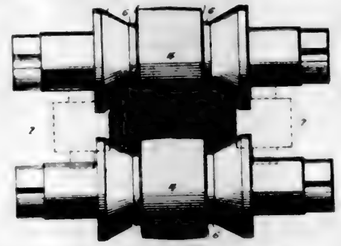
24. In a permutation-lock, the combination with a spindle and bolt, of a bolt-operating disk carried by the spindle, tumbler mechanism likewise carried by the spindle, spacing means disposing the tumbler mechanism and bolt-operating disk in separated relations, a projection extending from the spindle intermediate of the disk and tumbler, and means for effecting the engagement of said projection with either the disk or tumbler mechanism as desired.

709,079. PHOTOGRAPHIC SHUTTER. EMIL DÖNITZ, Jena, Germany, assignor to Firm of Carl Zeiss, Jena, Germany. Filed Aug. 27, 1900. Serial No. 28,124. (No model.)

Claim.—1. A safety-shutter consisting of two roller-blinds each wound upon a setting-roller at one end and upon an exposure-roller at the other end and having a transverse edge for forming the exposure-aperture, winding-springs connected with the exposure-rollers, pinions on the setting-rollers, toothed members engaging the pinions, one of which members is connected with a setting device and the other with a catching and releasing device, and a set of coöperative stops on the toothed members controlling the relative positions of these members, one of the two stops in contact during exposure being adjustable for the purpose of regulating the exposure-aperture.

2. A safety-shutter consisting of two roller-blinds each wound upon a setting-roller at one end and upon an exposure-roller at the other end and having a transverse edge for forming the exposure-aperture, winding-springs connected with the exposure-rollers, pinions on the setting-rollers, coaxial spur-wheels engaging the pinions, one of which spur-wheels is connected with a setting device and the other with a catching and releasing device, and a set of coöperative stops on the spur-wheels controlling the relative positions of these wheels, one of the two stops in contact during exposure being adjustable for the purpose of regulating the exposure-aperture.

709,080. PROCESS OF SHAPING METAL I-BEAMS, CHANNEL-BEAMS, &c. WILLIAM A. DUNN, Smithville, Minn., assignor of one-half to Athol Morton Miller, Duluth, Minn. Filed Jan. 3, 1902. Serial No. 88,301. (No model.)



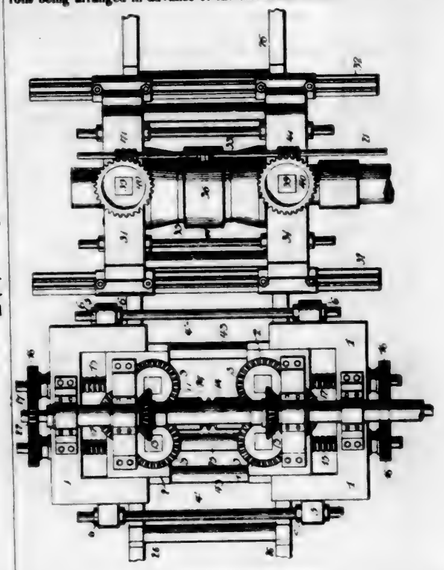
Claim.—The herein-described process of making flanged beams from metal ingots or slabs, which consists in subjecting the ingot or slab intermediate of its sides to roller-pressures exerted in a vertical direction, subjecting the sides of the ingot or slab to pressures exerted in a horizontal direction, and simultaneously with the vertical pressures applying roller-pressures to the side edges of the ingot or slab in an inward direction and at an abrupt angle to the horizontal.

709,081. MACHINE FOR SHAPING METAL I-BEAMS, CHANNEL-BEAMS, &c. WILLIAM A. DUNN, Smithville, Minn., assignor of one-half to Athol Morton Miller, Duluth, Minn. Filed Jan. 3, 1902. Serial No. 88,302. (No model.)

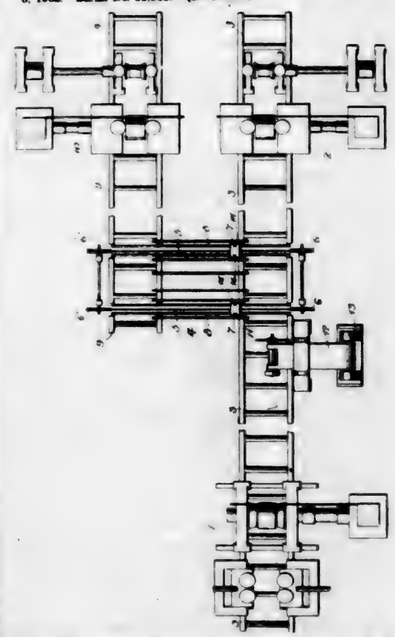
Claim.—1. In a mill of the class described, the combination of horizontal shaping-rolls mounted in a frame, vertical shaping-rolls mounted in a frame independent of the aforesaid frame, adjusting-screws for the horizontal rolls, a shaft having gear connection with said screws to rotate them, adjusting-screws for the vertical rolls, a shaft connected by multiplying-gearing with the screws of the vertical rolls for effecting the adjustment of the latter at a rate of speed in excess of that of the horizontal rolls, gearing between the said shafts, and a single hand-operated clutch in the vertical-rolls-adjusting shaft for checking the adjustment of the vertical rolls at any point during the operation of the mill for the purpose specified.

2. In a mill of the class described, the combination of vertical shaping-rolls, laterally-adjustable housings, frames movable in said housings and carrying said vertical rolls, screws for adjusting said frames, a shaft extending transversely of the frames, multiplying-gearing between the shaft and screws, a single hand-operated clutch in the shaft beyond the gearing for checking the adjustment of said vertical rolls at any point during the operation of the mill, horizontal shaping-rolls, a laterally-adjustable frame for the horizontal rolls arranged in longitudinal alinement with and independent of the vertical roll-frame, adjusting-screws for the horizontal rolls, and a shaft having gear connection with said screws and with the aforesaid shaft.

3. In a mill of the class described, horizontal rolls for shaping a flanged beam from a metal ingot or slab, one of said rolls having intermediate of its ends an approximately cylindrical roller-surface exerting pressure in a vertical direction against the ingot or slab to shape the web, grooves flanking the cylindrical surface the outer wall of each groove inclining from the groove-base at an abrupt angle to the horizontal and maintaining pressure against the side edges of the ingot or slab inwardly toward the center to force the metal into the groove to shape the flanges, and vertical rolls exerting pressures in a horizontal direction against the sides of the ingot or slab to reduce the height of the beam, said vertical rolls being arranged in advance of the horizontal rolls.



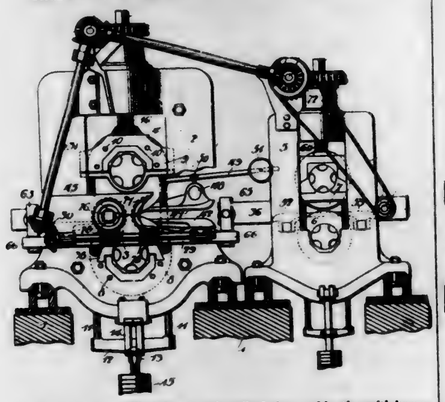
709,082. ROLLER-MILL. WILLIAM A. DUNN, Smithville, Minn., assignor of one-half to Athol Morton Miller, Duluth, Minn. Filed Jan. 3, 1902. Serial No. 88,303. (No model.)



Claim.—The combination of a metal-carrying table leading from a shaping-mill to an intermediate mill and from thence to a finishing-mill,

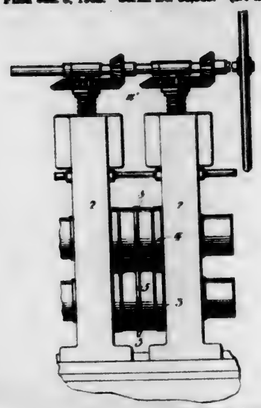
a second metal-carrying table in parallel relation to the first table and leading to a second intermediate mill and from thence to a second finishing-mill, means for dividing the metal into lengths said means being located at the first-named table, and an endless conveyer between the tables adapted automatically to transfer a severed portion of the metal to the second table whereby both portions of the metal are conveyed to the intermediate and finishing mills for simultaneous treatment.

709,083. MACHINE FOR ROLLING METAL I-BEAMS, CHANNEL-BEAMS, &c. WILLIAM A. DUNN, Smithville, Minn., assignor of one-half to Athol Morton Miller, Duluth, Minn. Filed Jan. 3, 1902. Serial No. 88,304. (No model.)



Claim.—In a mill of the class described, the combination with beam-web rolls and side rolls, of rolls located to the rear of the aforesaid rolls having projecting narrow roller rim portions flanking a reduced central portion said rims adapted to exert roller-pressure against the beam-web at the flanges, and outer cylindrical roller-surfaces and beveled roller portions extending from the cylindrical roller-surfaces to the rim portions for respectively working the edges and inner faces of the beam-flanges.

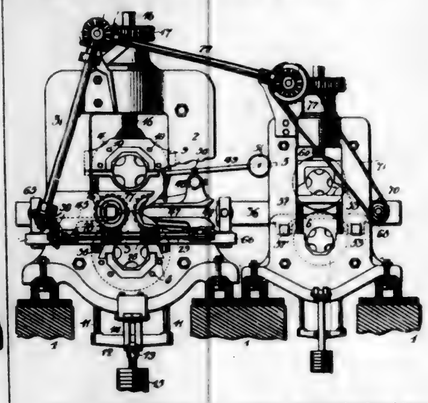
709,084. ROLLER-MILL AND CUTTER. WILLIAM A. DUNN, Smithville, Minn., assignor of one-half to Athol Morton Miller, Duluth, Minn. Filed Jan. 3, 1902. Serial No. 88,305. (No model.)



Claim.—1. The combination of a pair of rolls for finishing a shaped flanged beam having cylindrical web-rolling portions, cutter-blades on the rolls between the cylindrical web-rolling portions, each blade having two closely-adjacent cutting edges, the outer faces of which are at a right angle to said cylindrical web-rolling portions for producing finished edges on the finished severed portions of the beam.

2. The combination of a pair of rolls for finishing a shaped flanged beam having cylindrical web-rolling portions, cutter-blades on the rolls between the cylindrical web-rolling portions, each blade having two closely-adjacent cutting edges, the outer faces of which are at a right angle to said cylindrical web-rolling portions for producing finished edges on the finished severed portions of the beam, and the inner faces of which cutting edges are beveled and provide a concave rolling-surface for shaping the intermediate severed portion for further treatment.

709,085. MACHINE FOR ROLLING METAL I-BE...MS, CHANNEL-BEAMS, &c. WILLIAM A. DUNN, Smithville, Minn., assignor of one-half to Athol Morton Miller, Jr., Duluth, Minn. Original application filed Jan. 3, 1902, Serial No. 88,304. Divided and this application filed June 23, 1902. Serial No. 112,862. (No model.)



Claim.—1. In a mill of the class described, the combination of frames or housings supported to be adjusted laterally to accommodate different-size rolls, horizontal rolls mounted in said frames or housings, a shaft extending at the maximum adjustment of the frames or housings loosely through the latter, and a guide-plate mounted at its outer end on said shaft and contacting at its inner end with one of said rolls.

2. In a mill of the class described, the combination of frames or housings supported to be adjusted laterally to accommodate different-size rolls, horizontal rolls mounted in said frames or housings, a shaft loosely extending at the maximum adjustment of the frames or housings through the latter, a guide-plate mounted at its outer end on said shaft, and means for elevating the inner end of the guide-plate against the upper roll said means including a weight.

3. In a mill of the class described, the combination of frames or housings supported to be adjusted laterally to accommodate different-size rolls, horizontal rolls mounted in said frames or housings, side guides for the metal, a separate screw-rod for each guide permitting said adjustment of the frames or housings, and means for simultaneously rotating said screw-rods.

4. In a mill of the class described, a roll consisting of a shaft, outer cylindrical roller portions, adjacent roller-rims, and a two-part spacing-sleeve between the rims secured to the shaft, said roller portions, rims and sleeve being removably keyed to the shaft.

5. In a mill of the class described, the combination of a vertical roll, a spindle supporting said roll vertically, a saddle at the lower end of the spindle, a frame, a carriage guided by the frame and forming the lateral supports for the roll, means for moving the carriage, an adjustable connection between the carriage and saddle, a bracket-arm extending from the saddle and having a dovetailed groove, and a guide for the metal having a dovetailed end seated in the groove.

709,086. PROCESS OF MAKING PEROXID OF MAGNESIUM. FRIEDRICH ELIAS, Berlin, Germany. Filed Feb. 24, 1902. Serial No. 95,266. (No specimens.)

Claim.—1. The process for producing peroxid of magnesium by acting upon barium peroxid by a slightly-acidulated solution of a magnesium salt, then filtering, washing and drying.

2. The process of producing peroxid of magnesium, which consists in hydrating peroxid of barium and reacting upon an acidulated solution of a magnesium salt with the resulting product, substantially as described.

3. The process of producing peroxid of magnesium, which consists in reacting upon a cold acidulated solution of a magnesium salt with hydrated peroxid of barium, substantially as described.

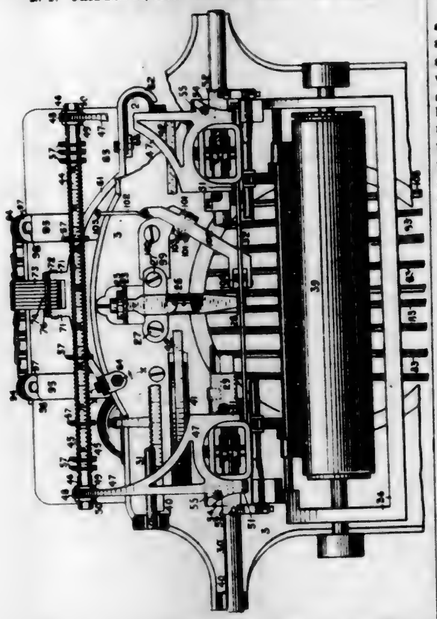
4. The process of producing peroxid of magnesium, which consists in reacting upon an acidulated solution of magnesium chlorid with barium peroxid, substantially as described.

5. The process of producing peroxid of magnesium, which consists in reacting upon an acidulated solution of magnesium chlorid with hydrated barium peroxid, substantially as described.

709,087. STOVEPIPE HOLDER OR COLLAR. JAMES E. FAHLSER, Whatcom, Wash. Filed Feb. 24, 1902. Serial No. 95,267. (No model.)

Claim.—A device for holding a pipe in a chimney, comprising a bar bent at right angles at two locations, the ends of which are perforated, a cross-piece K, transverse slots near its ends through which the bar O passes, the ends of said cross-piece projecting beyond the parallel perforated portions of said bar, a collar having a central aperture to receive a pipe, slots in said thimble at locations diametrically opposite each other to receive the ends of said bar, pins passing through said perforations, as shown and described.

709,088. TYPE-WRITING MACHINE. JACOB FELSH, New York, N. Y. Filed Dec. 18, 1899. Serial No. 740,703. (No model.)



Claim.—1. In a type-writing machine, the combination with type-operating mechanism and a power-driven carriage, of a tabulating mechanism including a series of column-stops and a set of independent denomination-stops, and also including independently-operable means for releasing the carriage after the positioning of the stop members.

2. In a type-writing machine, the combination with type-operating mechanism and a power-driven carriage, of a tabulating mechanism including a series of denomination-keys and a series of independently-movable stops connected thereto, and also including an independent release-key for the carriage, the construction and arrangement being such that any key may be operated to set its corresponding stop, and such that said release-key may then be operated to enable the carriage to move rapidly to the point determined by the setting of said stop.

3. In a type-writing machine, the combination with type-operating mechanism and a power-driven carriage, of a tabulating mechanism including an adjustable column-stop arranged upon the carriage and a series of denomination-stops arranged upon the frame of the machine, and keys for controlling said denomination-stops, and said tabulating mechanism also including an independently-operable carriage-release key arranged upon the frame of the machine.

4. In a type-writing machine, the combination with a carriage and a type-operating mechanism, including a keyboard, of a tabulating mechanism for said carriage comprising a series of denomination-stops, a tappet, and means extending to said keyboard for effecting relative positioning between the tappet and the denomination-stops, said tabulating mechanism also comprising auxiliary means extending from the carriage to the keyboard and operable independently of said positioning means, for causing a movement of the carriage independent of the escapement mechanism and so that it may be arrested by the engagement of said tappet with the selected stop and hence positioned at the desired point.

5. In a type-writing machine, the combination with a carriage and a type-operating mechanism, including a keyboard, of a tabulating mechanism for said carriage comprising a series of stops, a tappet, and a series of denomination-keys arranged in line at the keyboard and provided with means for effecting different relative positioning between said stops and said tappet, said tabulating mechanism also comprising independently-operable means extending to the keyboard for releasing said carriage and hence that portion of the tabulating mechanism moving therewith from the control of the carriage-escapement mechanism, so that the carriage may be positioned at the desired point by the engagement of said tappet with the selected stop, the construction and arrangement being such that said release movement may be effected subsequently to and independently of the operation of the selected denomination-key.

6. In a type-writing machine, the combination with a carriage and a type-operating mechanism, including a keyboard, of a tabulating mechanism for said carriage comprising a series of stops, an adjustable tappet, and a series of denomination-keys arranged at the keyboard and provided with means for effecting different relative positioning between said stops and said tappet, said tabulating mechanism also comprising an auxiliary key arranged in proximity to said denomination-keys and connected to means for releasing the carriage and hence that portion of the tabulating mechanism moving therewith from the control of the carriage-escapement mechanism, so that one finger may be employed to operate any of said denomination-keys and so that another finger of the same hand may be employed to operate independently said auxiliary key so as to cause the carriage to be positioned at the desired point by the engagement of said tappet with the selected stop.

7. In a type-writing machine, the combination with a carriage and a type-operating mechanism including a keyboard, of a tabulating mechanism including an adjustable tappet, a series of independently-movable blades for arresting said tappet and carriage at variable distances from a point determined by the adjustment of said tappet, and a series of denomination-keys arranged in line at said keyboard and each connected to one of said blades but not adapted to release the carriage, said tabulating mechanism also including an auxiliary key extending parallel to said line of denomination-keys and connected to means for causing a release of said tappet together with said carriage from the control of the carriage-escapement mechanism.

8. In a type-writing machine, the combination with type-operating mechanism including a keyboard, of a carriage, a series of independently-movable stops, means for engaging the stops to arrest the carriage, a series of depressible finger-keys arranged at the keyboard and operatively connected to the said stops, and a key at the keyboard for releasing the carriage subsequent to the positioning of the selected stop.

9. In a type-writing machine, the combination of a carriage, a keyboard of the printing mechanism, a space-key arranged in front of the keyboard, and a tabulating mechanism, the latter including both a series of depressible denomination-keys arranged in line in front of said space-key, and an auxiliary carriage-release key arranged in front of said denomination-keys.

10. In a type-writing machine, the combination of a keyboard, a series of type-operating key-levers extending rearwardly therefrom, a carriage, a series of movable denomination-stops arranged upon the machine, means on the carriage for engaging the denomination-stops, and a series of horizontal rock-shafts arranged beneath said key-levers and extending rearwardly from the front of the machine and provided at their forward

ends with depressible finger-keys and at their rear ends with means for operating the denomination-stops.

11. In a type-writing machine, the combination of a carriage, a tappet thereon, a system of tabulator-blades, a series of longitudinally-extending rock-shafts arranged in the base of the machine, means for enabling the rock-shafts to move the tabulator-blades, a crank-arm arranged at the end of each rock-shaft, and an upright key-stem for and pivotally mounted upon each of said crank-arms.

12. In a type-writing machine, the combination of a system of tabulator-blades, a tappet, a series of horizontal rock-shafts arranged longitudinally in the base of the machine, each rock-shaft being provided with a crank-arm at its rear end, links connecting the crank-arms to the blades, crank-arms provided at the front ends of the rock-shafts, and upright key-stems pivotally secured thereon.

13. In a type-writing machine, the combination of a carriage, a tappet thereon, a series of tabulator-blades mounted on the frame of the machine, a series of links connected at their upper ends to said tabulator-blades and diverging at their lower ends, a series of longitudinally-arranged horizontal rock-shafts provided at their rear ends with crank-arms, each of said crank-arms being pivotally connected to the lower end of one of said links, and said horizontal rock-shafts diverging at their forward ends, and a key-operated crank-arm secured to the forward end of each shaft.

14. In a type-writing machine, the combination of a paper-carriage a bar thereon, a tappet adjustable along said bar, a series of vertical tabulator-blades pivoted on a fixed portion of the machine in proximity to said paper-carriage, each blade being provided with a crank-arm, a series of depressible keys arranged at the keyboard of the type-operating mechanism, and operative connections between said keys and said crank-arms, said connections including a series of horizontal longitudinally-extending rock-shafts arranged in the bottom of the machine.

15. In a type-writing machine, the combination of a paper-carriage, a bar thereon, a tappet adjustable along said bar, a series of tabulator-blades pivoted upon a fixed portion of the machine in proximity to said paper-carriage and each having a rearwardly-extending crank-arm, a series of links, the upper ends of which are connected to said crank-arms, and a series of key-operated horizontal rock-shafts extending longitudinally of the machine and connected at their rear ends to said links.

16. In a type-writing machine, the combination of a carriage, a bar thereon, a tappet adjustable along said bar, a series of vertical tabulator-blades pivoted on the frame of the machine and each provided with a horizontal crank-arm, a series of vertical links connected at their upper ends to the crank-arms, a series of rock-shafts extending longitudinally of the machine and provided at their rear ends with crank-arms which engage the lower ends of said links and also provided at their forward ends with crank-arms which are connected to vertical stem-keys, and a series of returning-springs.

17. In a type-writing machine, the combination with a carriage, of tabulating mechanism therefor, including a bar on said carriage, a tappet adjustable along said bar, a series of tabulator-blades pivoted upon a fixed portion of the machine, a series of depressible denomination-keys arranged at the keyboard of the type-operating mechanism, and operative connections extending from said keys to said tabulator-blades, and also including a carriage-release key arranged in proximity to said denomination-keys.

18. In a type-writing machine, the combination of a bracket comprising a horizontal plate, as 84, a vertical plate having a hook 90, catching over the top of the front bar of the type-writer base, a clamp 91 engaging the lower edge of said front bar, screw 92, means on said bracket for pivotally supporting a series of rock-shafts, a series of perforations in said horizontal plate, a series of key-bearing stems arranged in said perforations and operatively connected to said rock-shafts, and connections from said rock-shafts to a series of stops adapted to engage stops on the paper-carriage.

19. In a type-writing machine, the combination of vertical plate 85, upwardly-extending hook 93 thereon, oblique ear 94 at the upper end of said plate, horizontal plate or strap 95 having an ear parallel to said oblique ear, means for drawing the ears toward each other, hook 96 on said horizontal plate, the hook on said vertical plate being constructed to engage the lower edge of the vertical flange of the base of the machine and the hook on said horizontal plate being constructed to engage a horizontal plate on said base, a series of horizontal perforations in said vertical plate, a series of key-operated rock-shafts journaled in said perforations, a series of tabulator-blades operatively connected to said rock-shafts, a carriage, and a tappet thereon.

20. In a type-writing machine, the combination of a carriage, a tappet thereon, a bracket, a series of tabulator-blades mounted on said bracket, and means for securing said bracket to the frame of the machine so that the bracket may be adjusted to bring the working faces of the tabulator-blades to a vertical position.

21. In a type-writing machine, the combination of a carriage, a tappet thereon, a bracket, tabulating-blades mounted thereon, means for securing said bracket to the frame of the machine so as to prevent movement thereof in a horizontal direction, and a leveling-screw for swinging the bracket up or down so as to adjust the blades to a vertical plane.

22. In a type-writing machine having a base, vertical columns thereon, a top plate supported on the columns, and a carriage traveling over the top plate, the combination of a bracket provided with a hook for engaging one of said columns and with an arm extending over said top plate, means for adjustably clamping the bracket to the column and to the top plate, a series of key operated tabulator-blades supported on said bracket, and a tappet arranged upon the carriage for engaging the blades.

23. In a type-writing machine, the combination with a carriage, of opposite arms thereon each provided with a perforation and the perforations being in the same axial line, a bar extending through said perforations, the ends of the bar being threaded and provided with nuts to bear against each of said arms upon opposite sides thereof, whereby the bar may be adjusted longitudinally and locked in its adjusted position, a tappet adjustable along the bar, and key-operated means for engaging the tappet to arrest the carriage.

24. In a type-writing machine, a bar formed from a cylindrical rod and having two parallel opposite plane faces extending longitudinally thereof, said faces being produced by cutting away the cylindrical bar upon opposite sides thereof, a series of teeth cut at letter-space intervals on said bar, and a tappet constructed to slide along said bar without engaging the teeth thereof and also constructed to be turned into engagement with said teeth.

25. In a type-writing machine, a bar formed from a cylindrical rod and having two parallel opposite plane faces extending longitudinally thereof, said faces being produced by cutting away the cylindrical bar upon opposite sides thereof, a series of teeth cut at letter-space intervals on said bar, and a tappet constructed to slide along said bar without engaging the teeth thereof and also constructed to be turned into engagement with said teeth, said tappet having a weighted portion to maintain it in such engaged or working position.

26. In a type-writing machine, the combination with a carriage, of a bracket provided with a hook and a wedging surface, a screw as 55, and a washer as 54, on the screw for engaging said wedging surface to clamp the bracket to the carriage.

27. In a type-writing machine, the combination of two meeting levers, each pivoted between its ends, means for engaging the levers to each other at their meeting ends, a link pivoted to the outer arm of each lever, means for guiding the links, and a key-bar connecting said links.

28. In a type-writing machine, the combination of two levers connected together to move in unison, a key-bar connected with said levers to have substantial parallel motion, a carriage, and a carriage-release mechanism connected to and operated by said parts.

29. In a type-writing machine, the combination of a longitudinally-extending rock-shaft, a transverse substantially parallel-motion key-bar mounted upon pivots extending parallel with said rock-shaft, means for enabling said key-bar to rock said shaft, and means for enabling said rock-shaft to release the carriage from the control of its letter-spacing devices.

30. In a type-writing machine, the combination of a carriage, a rack thereon, a lever for moving said rack to release the carriage, a rod connected at one end to said lever, a rock-shaft, a crank-arm mounted on the rock-shaft and connected to the other end of said rod, and a key for actuating said rock-shaft.

31. In a type-writing machine, and in a tabulating mechanism, the combination of a carriage having tappets, a series of tabulating-blades on the frame, a bracket secured to the front of the machine, a series of depressible tabulating-keys guided in said bracket, and a carriage-release key arranged upon said bracket in front of said tabulating-keys.

32. In a type-writing and tabulating mechanism, the combination with a carriage having rollers 35 and open frames in which said rollers are journaled, of a pair of brackets 47, each provided with bifurcated hooks 51 which fit closely against said open frames, to prevent endwise movement of said brackets upon said carriage, said hooks being adapted to catch over a flange upon said carriage, means for drawing the hooks firmly against said flange, a transverse bar secured to the free ends of said brackets, and a series of tappets arranged upon the bar.

33. In a type-writing and tabulating mechanism, the combination with a carriage of a cylindrical bar flattened upon opposite sides and having teeth cut upon opposite round sides thereof, a tappet on said bar having a circular perforated portion 59, and slotted portions 58 on opposite sides thereof and communicating therewith, and stop mechanism engaging said tappet when in its normal position.

34. In a type-writing and tabulating mechanism, the combination with stop-projecting mechanism of independently-operable carriage-releasing mechanism and means for preventing the operation of the carriage-releasing mechanism until a stop has been projected

35. In a type-writing machine, the combination with a carriage of a tabulating mechanism therefor, including a key which normally is incapable of releasing said carriage from the control of its escapement mechanism, said tabulating mechanism also including a series of denomination-keys, each of which is capable of projecting a denomination-stop and also of enabling the first-mentioned key to be subsequently operated to effect the release of said carriage, so that the projected stop may cause the carriage to be arrested after its releasement.

36. In a type-writing machine and in a tabulating mechanism, the combination of a carriage, a series of key-actuated denomination-stops, a series of column-stops for coacting therewith and predetermining the arresting position of said carriage, an independently-operable release-key mechanism controlling said series of column-stops, and means whereby the column-stops can be released only after the selected key-operated denomination-stop has been set or moved to operative position.

37. In a type-writing machine and in a tabulating mechanism, the combination of a carriage, a series of key-actuated denomination-stops, a series of column-stops adapted to cooperate therewith, and a release mechanism having an actuating-key at the type-writer keyboard adapted to be effective only after one of said denomination-stop keys has been actuated, and which when pressed upon and held releases both the carriage and the column-stops for a rapid movement, to position the carriage at the point predetermined by the selected denomination-stop.

38. In a type-writing machine, the combination with a carriage of a tabulating mechanism therefor, including a key which normally is incapable of being independently operated for releasing said carriage from the control of its escapement mechanism, said tabulating mechanism also including a series of denomination-keys and a device for enabling the first-mentioned key to be operated to effect the release of said carriage, said enabling device being common to all of said denomination-keys, whereby the first-mentioned key may be operated in conjunction with any of the denomination-keys to release the carriage so that it may be arrested at a point determined by the selected denomination-key.

39. In a type-writing machine and in a tabulating mechanism, a series of keys for controlling a series of denomination-stops, a carriage-releasing mechanism, and means for preventing actuation thereof until after one of the denomination-keys has been actuated.

40. In a type-writing machine, the combination of a carriage, a tabulating mechanism therefor having two keys one of which operates to release the carriage, and the other of which operates to project or move a carriage-stopping device, and means controlled by the stop-actuating key for retaining said carriage-release key in normal position until after the stop-actuating key has been actuated.

41. In a type-writing machine, the combination of a carriage, a normally locked release-key therefor, a system of independently-movable tabulating-stops, a tappet and a set of keys connected both to release said release-key and also to operate said system of tabulating-stops.

42. In a type-writing machine, the combination of a carriage, and a tabulating mechanism therefor having two keys, one of which operates to release the carriage and the other of which operates to project or move the carriage-stopping device, and means for preventing simultaneous operation of said keys.

43. In a type-writing machine, the combination with a carriage, of a tabulating mechanism therefor having a plurality of movable stops, a key connected to each of said stops, and a universal locking mechanism for retaining any operated key of said series in abnormal or operated position while said carriage is moving rapidly to the predetermined point.

44. In a type-writing machine, the combination of a carriage, and a tabulating mechanism therefor having two keys, one of which operates to release the carriage and the second of which operates to project or move the carriage-stopping device, and means for retaining said second key in its operated position while the said carriage-release key is moving from and returning to normal position.

45. In a type-writing machine and in a tabulating mechanism, a series of keys for controlling a series of denomination-stops, a carriage-releasing mechanism, means for preventing actuation thereof until after one of the denomination-keys has been actuated, and means for preventing the return of the denomination-key until after the return of the operated release-key.

46. In a type-writing machine, the combination of a carriage, a tappet, a coacting stop, a key for causing the relative movement of the tappet and the stop, means for releasing the carriage, and a lock for automatically preventing the return of said key to normal position during the operation of the carriage-releasing mechanism.

47. In a type-writing machine, the combination of a carriage, a system of tabulating-blades, a tappet, a series of keys for causing relative adjustment or positioning of said blades and tappet, carriage-releasing mechanism, and means common to all of said keys for automatically locking any operated key in its depressed position during the operation of the carriage-releasing mechanism.

48. In a type-writing machine, the combination of a carriage, a system of tabulating-blades, a tappet, a series of denomination-keys for operating said system, and a carriage-release key connected to automatically lock any of said keys in its operated position.

49. In a type-writing machine, the combination of a carriage, a system of tabulating-blades, a tappet, a series of denomination-keys for operating said system, and a release-key connected to automatically lock each of said keys in its operated position and on its return to normal position to automatically release said lock and denomination-key.

50. In a type-writing machine, the combination of a carriage, a tappet, a stop, a denomination-key for effecting the relative positioning of the tappet and the stop, a carriage-releasing key, a lock for holding said carriage-release key in its normal position, means controlled by the denomination-key for releasing said lock, and means for enabling said release-key when in its operated position to hold the denomination-key in its operated position.

51. In a type-writing machine, the combination of a carriage, a tappet, a stop, a denomination-key for effecting relative positioning of the stop and the tappet, a carriage-release key, a lock for holding said carriage-release key in its normal position, means controlled by the denomination-key for releasing said lock, and means for enabling said release-key when in its operated position to hold the tabulating-key in its operated position, said release-key being constructed upon the return thereof to normal position to automatically release said depressed denomination-key.

52. In a type-writing machine, the combination of a carriage, a system of tabulator-blades, a tappet, a series of denomination-keys for operating said system, a carriage-release key, a lock for holding said release-key in normal position, means operated by each of said denomination-keys to release said lock, and means for enabling said carriage-release key to hold each of said denomination-keys in its operated position, said denomination-key being constructed upon the return thereof to normal position to automatically release the operated denomination-key.

53. In a type-writing and tabulating mechanism, the combination of a carriage, a carriage-release key, a pivotally-mounted lock constructed to normally prevent movement of the key, an arm secured upon said lock, and a key for operating said arm.

54. In a type-writing and tabulating mechanism, the combination of a carriage, a carriage-release key, an upright arm pivotally mounted below the release-key, and constructed for engaging said key to prevent the operation thereof, a horizontal arm connected to said upright arm, and a key for operating said horizontal arm.

55. In a type-writing and tabulating mechanism, the combination of a denomination-key, a carriage, a carriage-release key, and a bell-crank, one arm whereof is constructed to normally prevent the operation of the release-key, and the other arm whereof is constructed to be operated by the denomination-key for the purpose of releasing the said release-key.

56. In a type-writing and tabulating mechanism, the combination of a carriage, a carriage-release key, a bell-crank comprising an upright arm constructed to normally prevent the operation of the release-key and a horizontal operating-arm, and a series of denomination-keys each provided with means for actuating said horizontal arm so as to release said release-key.

57. In a type-writing machine, the combination of a carriage, a system of tabulator-stops, a tappet, a series of denomination-keys arranged in line and connected to means for effecting relative positioning of the tabulator-stops and tappet, a release-key, a lock therefor, a pivoted universal arm or plate for releasing said lock, said universal arm being extended in a direction parallel with said denomination-keys, and means upon each denomination-key for actuating said universal arm.

58. In a type-writing machine, the combination of a carriage, a system of tabulator-blades, a tappet, a series of denomination-keys arranged in line transversely of the machine and provided with means for effecting relative adjustments of the tabulator-blades and tappet, a release-key bar arranged in front of said series of keys and extending parallel therewith, a lock pivoted below the release-key for normally preventing the operation of the same, said lock being provided with a universal arm or plate in rear of said pivot, and said universal arm extending in a direction parallel with said denomination-keys, and means upon each denomination-key for actuating said universal arm and lock.

59. In a type-writing and tabulating mechanism, the combination of a carriage, a carriage-release key, a lock therefor, a series of denomination-keys, and a release-bar for said lock as 126, said release-bar being common to all of said denomination-keys.

60. In a type-writing machine, the combination of a carriage, a stop, a tappet, key-actuated means for effecting relative positioning of the stop and tappet, a catch, means for enabling the key to engage the catch, carriage-releasing mechanism, and means for enabling said release mechanism to control the catch and prevent the return of the key to normal position during the operation of said release mechanism.

61. In a type-writing machine, the combination of a carriage, a system of tabulator-blades, a tappet, a series of finger-keys arranged in line and provided with means for effecting different relative positioning of the tabulator-blades and tappet, a universal catch, means for enabling any of said keys to engage the catch, carriage-releasing mechanism, and means for enabling the said carriage-release mechanism to control the catch and prevent the return of any key to normal position in advance of the return of the carriage-release mechanism to normal position.

62. In a type-writing machine, the combination of a carriage, a system of tabulator-blades, a tappet, a series of denomination-keys arranged in line and provided with means for effecting different relative adjustments of the tabulator-blades and tappet, a pivoted universal catch constructed to be engaged by each of said denomination-keys, said catch being provided with a detent-arm, and a carriage-release key constructed to engage said detent-arm to enable the catch to prevent the return of the said denomination-key to normal position.

63. In a type-writing machine, the combination of a carriage, a system of tabulator-blades, a tappet, a series of finger-keys arranged in line and provided with means for effecting different relative positioning of the tabulator-blades and tappet, a horizontally-arranged pivoted universal catch for engaging each of said finger-keys, said catch being provided with an upright arm, and a carriage-release key constructed to coact with said upright arm to enable the catch to prevent the return of the said finger-key to normal position.

64. In a type-writing machine, the combination of a carriage, a system of tabulating-blades, a tappet, a series of rearwardly-extending horizontal rock-shafts provided with means for effecting different relative positioning of the blades and the tappet, a crank-arm secured to the forward end of each rock-shaft, a vertical key-bearing stem pivotally secured to each crank-arm, a carriage-release key arranged in proximity to said series of keys, a pivoted arm arranged beneath said release-key to prevent the downward movement thereof, said arm being provided with a horizontal plate, and means upon each key-stem for engaging the plate to rock the arm and release the release-key.

65. In a type-writing machine, the combination of a series of key-bearing stems arranged in line, a horizontal bar arranged parallel with said series, a pivoted vertical arm as 133 arranged beneath the horizontal bar, to prevent the depression thereof, a horizontal plate secured to said arm and folded so as to form a channel along the edge thereof parallel and in proximity to said series of key-bearing stems, and a lateral projection upon each of said stems for entering said channel and actuating the plate.

66. In a type-writing machine, the combination of a series of key-bearing stems arranged in line, a horizontal bar arranged parallel with said series, a pivoted vertical arm as 133 arranged beneath the horizontal bar, to prevent the depression thereof, a horizontal plate secured to said arm and folded so as to form a channel along the edge thereof parallel and in proximity to said series of key-bearing stems, and a lateral projection upon each of said stems for entering said channel and actuating the plate, said horizontal bar when depressed being constructed to act as a stop to prevent the return to initial position of said vertical arm, plate and key-bearing stem.

67. In a type-writing machine, the combination of a power-driven carriage, a tappet, a series of movable tabulator-blades for coaction with said tappet to arrest said carriage at different distances from a predetermined point, a series of denomination-keys operatively connected with said blades, but not releasing said carriage, carriage-release mechanism, and a lock for said carriage-releasing mechanism, said lock being operatively connected with the said denomination-keys.

68. In a type-writing machine, the combination of a power-driven carriage, a tappet, a series of movable tabulator-blades for coaction with said tappet to arrest said carriage at different distances from a predetermined point, a series of denomination-keys operatively connected with said blades, but not releasing said carriage, carriage-release mechanism, and a lock for preventing disengagement of said blade and said tappet before the return to normal position of the carriage-releasing mechanism.

69. In a type-writing machine, the combination of a power-driven carriage, a tappet, a series of independently-movable denomination-stops for coaction with said tappet to arrest said carriage at different distances from a predetermined point, a series of denomination-keys operatively connected with said stops, carriage-release mechanism independent of said stop-controlling devices, and a locking mechanism for preventing simultaneous motion of any of said denomination-keys and said carriage-release mechanism.

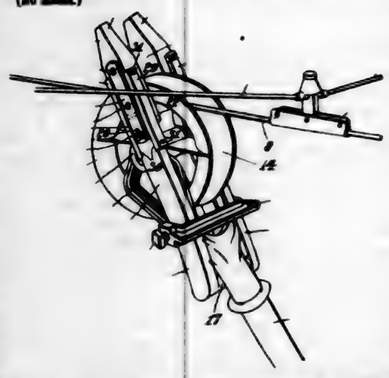
70. In a type-writing machine, the combination of a power-driven carriage, a tappet connected to and moving with said carriage, a series of independently-movable tabulator-blades mounted upon the machine-frame for coaction with said tappet to arrest said carriage at different distances from a predetermined point, a series of denomination-keys operatively connected with said blades, key-actuated carriage-release mechanism, and a lock for said carriage-release key, said lock being operatively connected with said denomination-keys.

71. In a type-writing machine, the combination of a power-driven carriage, a tappet connected to and moving with said carriage, a key-operated blade or stop normally out of and movable into the path of said tappet, key-actuated carriage-release mechanism, and a lock for preventing disengagement of said blade and said tappet until after the release of the carriage-releasing mechanism.

72. In a type-writing machine, the combination of a power-driven carriage, a tappet connected to and moving with said carriage, a series of movable tabulator-blades for coaction with said tappet to arrest said carriage at different distances from a predetermined point, a series of denomination-keys operatively connected with said blades, key-actuated carriage-release mechanism, and locking mechanism for preventing simultaneous motion of said releasing-key and said denomination-keys.

73. In a type-writing machine and in a tabulating mechanism, the combination of a carriage having a tappet, and a coacting stop on the framework, a key connected to said stop, and a carriage-releasing mechanism, including a key arranged in proximity to said controlling-key, whereby with one finger the stop may be set and with another the carriage may be released.

709,089. TROLLEY-GUARD. EDOUARD GAGNÉ, St. Charles, Canada, assignor of one-half to Pascal Bonneau, Willow Bunch, North-West Territories, Canada. Filed Apr. 16, 1902. Serial No. 103,943. (No model.)



Claim.—1. In an electric railway, a trolley-guard comprising a pair of bars clamped to the opposite sides of the trolley-pole and adjacent to the wheel, a pair of extensions pivotally mounted to the ends of said bars on transverse axes, said extensions extending above the rim of the trolley-wheel and being adapted to be depressed below said rim, and a pair of extensible springs secured at the front and rear sides of each of said bars and extensions and joining them, said springs being adapted to maintain said extensions longitudinally in line with said bars to project above the rim of said trolley-wheel, and to permit said extensions to be longitudinally turned about their pivots in either direction by front or rear pressure and restore them to their normal position after said pressure is removed.

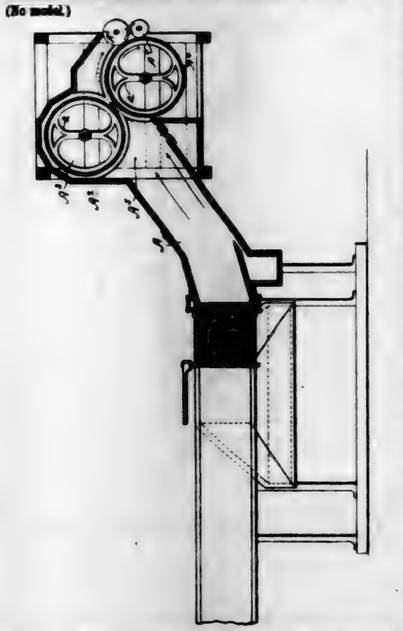
2. A trolley-guard comprising a U-shaped piece adapted to be removably clamped to the trolley-pole and having a pair of upstanding limbs adapted to embrace the opposite sides of the trolley-pole and and a transverse piece joining them and adapted to rest against the under side of the trolley-pole, a pair of hinged extensions mounted on transverse pivots at the upper ends of each of said limbs and extending normally above the trolley-wheel, and a pair of elastic extensible springs joined at their ends respectively to one of the extensions and the respective limbs at the front and rear sides thereof, whereby to resiliently maintain said extensions in axial line with said limbs and to permit them to be depressed by front or rear pressure below said trolley-wheel rim.

3. In an electric railway, the combination of a trolley-pole having a forked end, a trolley-wheel rotatably mounted in said end, a pair of bars adjustably clamped at opposite sides of said forked end, an extension pivotally mounted on the end of each bar, an extensible spring on the front side of said bar and extension and having its ends attached respectively to the bar and the extension, and a similar spring on the rear side attached in like manner whereby to retain said extension normally in axial line with said bar and to project above said trolley-wheel, substantially as described.

4. In an electric railway, the combination of a trolley-pole, a trolley-wheel rotatably carried at the end thereof, a U-shaped piece having upstanding limbs adapted to embrace the two sides of the trolley-pole end and a transverse member adapted to rest against the lower side of the pole at the base of said end, a screw-clamp overlying said pole end and U-shaped piece and radially clamping the latter in place upon the trolley-pole end, a pair of extension-pieces, a strap secured to each piece and extending beyond the lower end thereof, a transverse pivot-pin connecting each of said straps with the respective upstanding limb of said U-shaped piece, an overhanging tongue on the inner side of each of said extensions whereby to bring the inner face of said extensions into juxtaposition with the rim of the trolley-wheel, and means for resiliently retaining said extensions in upright position and permitting them to be depressed by pressure from the front or rear sides of the trolley-wheel, substantially as described.

5. In an electric railway, a trolley-guard comprising a U-shaped piece having a pair of upstanding limbs adapted to embrace the opposite sides of a trolley-pole end, a three-sided screw-clamp adapted to overlie said trolley-pole end and U-shaped piece and to securely clamp the latter to said trolley-pole end, a pair of extension pieces surmounting the ends of the limbs of said U-shaped piece, transverse pivot-pins connecting said extensions with the respective limbs of the U-shaped piece, said extensions having each an inwardly-extending face adapted to lie in juxtaposition with the edge of the trolley-wheel rim, and a spring arranged to resiliently maintain said extensions in upright positions and to permit the same to be depressed by pressure from front or rear and to restore them to their normal position, substantially as described.

709,090. CONDENSER FOR COTTON FIBERS. JEFFERSON M. GARDNER, New London, Conn. Filed Jan. 5, 1899. Serial No. 701,256. (No model.)



Claim.—1. In a condenser for cotton fiber, the combination with condensing-cylinders, of batting-rollers arranged adjacent thereto, adapted to receive and, by pressure, compact the cotton into a bat one of the batting-rollers being provided with means adapted to direct the cotton from the condensing-cylinders into engagement with the batting-rollers and the other having a surface pervious to air, substantially as described.

2. In a condenser for cotton fiber, the combination with condensing-cylinders, of batting-rollers arranged adjacent thereto adapted to receive and, by pressure, compact the cotton into a bat, one of the batting-rollers having a surface pervious to the passage of air, substantially as described.

3. In a condenser for cotton fiber, the combination with condensing-cylinders, of batting-rollers adapted to receive the cotton from the condensing-cylinders and, by pressure, compact the same into a bat, one of the batting-rollers being provided with flaps or projections and the other having a surface pervious to air, as and for the purpose specified.

4. In a batting-condenser, the combination of two wire-gauze-covered cylinders arranged approximately one above the other, means for driving one cylinder at a higher surface speed than the other, batting-rollers arranged adjacent thereto adapted to receive and, by pressure, compact the cotton into a bat and the surface of one of the batting-rollers being covered with wire-cloth, substantially as described.

5. In a condenser for cotton fiber, the combination of two condenser-cylinders, one of which is perforated to permit escape of air, the two cylinders revolving in opposite directions and having different surface speeds, batting-rollers adjacent to one of the condenser-cylinders and the upper roller being covered with wire-cloth, substantially as described.

6. In a condenser for cotton fiber, the combination of two condenser-cylinders, one of which is perforated to permit escape of air, the two cylinders revolving in opposite directions and having different surface speeds, means for feeding the cotton fiber, under pressure, to the condenser-cylinders, and two batting-rollers arranged adjacent to the condenser-cylinders in position to receive the condensed cotton from the condenser-cylinders, one of the rollers having a surface pervious to air, substantially as described.

7. In a batting-condenser, the combination of two gauze-covered condenser-cylinders arranged approximately one above the other, means for driving the upper cylinder at a higher surface speed than the lower cylinder, and two batting-rollers arranged adjacent to the lower condenser-cylinder, the lower batting-roller being rotated in the same direction to that of the said lower cylinder, and the upper roller having a surface pervious to air, substantially as described.

8. In a cotton-batting condenser, the combination of gauze-covered condenser-cylinders arranged approximately one above the other, means for driving the upper cylinder to impart thereto a higher rate of surface speed than that of the lower cylinder, batting-rollers arranged adjacent to the lower cylinder, the lower batting-roller being rotated in the same direction as the lower condenser-cylinder and provided with flaps or projections, and the upper roller being covered with wire-cloth, a housed discharge-flue arranged above the lower cylinder, and means for causing the proper separation and collection of the lint-cotton and condensation of the same into a smooth and even bat, substantially as described.

9. In a batting-condenser, the combination of two wire-gauze-covered cylinders arranged approximately one above the other, means for driving the upper cylinder at a higher rate of surface speed than the lower cylinder, batting-rollers arranged adjacent to the lower cylinder, the lower roller being rotated in the same direction as the lower cylinder, and the upper roller being covered with wire-cloth, a housed discharge-flue arranged above the lower cylinder, and means for causing a proper separation and collection of the lint-cotton and condensation of the same into a smooth and even bat, substantially as described.

709,091. WATER-HEATER. ROBERT J. GUNDRUM, Chicago, Ill. Filed May 11, 1901. Serial No. 59,830. (No model.)

Claim.—1. In a water-heater, the combination of a series of communicating lenticular water-chambers, water supply and discharge means communicating therewith, a series of graduated baffle-plates between said chambers, and means carried by said plates for supporting the chambers, substantially as described.

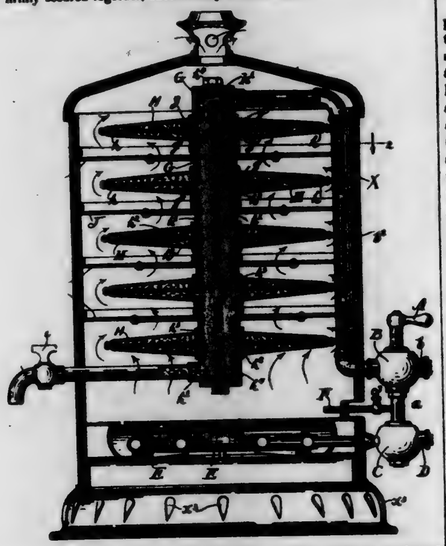
2. In a water-heater, the combination with a casing, inwardly-extending baffle-plates carried by said casing, annular sections carried by said plates, lenticular water-chambers between said annular sections, and means for clamping the said sections and chambers together, substantially as described.

3. In a water-heater, the combination with a casing, of inwardly-extending baffle-plates carried by said casing, annular sections supported by said plates, lenticular water-chambers supported by said annular sections, caps adjacent the outer ends of the upper and lower lenticular chamber, and a clamping-bolt passing through said chambers and sections and clamping the caps on said chambers, substantially as described.

4. In a water-heater, the combination with a casing, inwardly-extending baffle-plates carried by said casing, annular sections supported by said plates, lenticular chambers supported by said annular chambers, plates dividing said chambers horizontally and having communication with the upper and lower sections of said chambers formed by said plates, a water-supply, discharge means in communication with said chambers and means for securing said chambers to the annular sections, substantially as described.

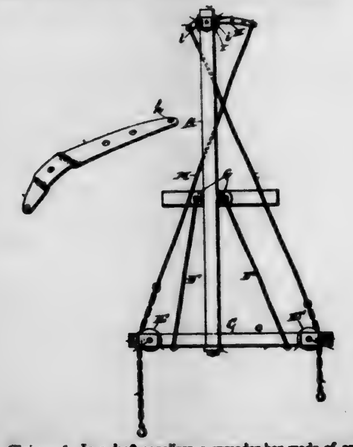
5. In a water-heater, the combination with a casing, graduated baffle-plates, carried by said casing, inwardly-extending arms carried by said plates, annular sections supported by said arms, lenticular chambers supported by said sections and extending between the baffle-plates, plates dividing said chambers horizontally, and having openings near their outer

peripbery, thus communicating the two sections formed by said plate, a water supply and discharge pipe in communication with said chambers, caps adjacent the outer ends of the upper and lower lenticular chambers and a clamping-bolt passing centrally through said annular sections and chambers and clamping the caps on said chambers, whereby they are firmly secured together, substantially as described.



6. In a water-heater, the combination with a series of graduated plates, a series of lenticular chambers extending between said plates, and a water supply and discharge means communicating with said chambers, substantially as described.

709,092. DRAFT-EQUALIZER. JEFFERSON B. HAYDEN, Abilene, Tex. Filed Dec. 31, 1901. Serial No. 87,866. (No model.)



Claim.—1. In a draft-equalizer, a spreader-bar made of angle-iron having the upright side cut down near each end of the bar, and the end turned back on itself to form bearings for pulleys, substantially as shown and described.

2. In a draft-equalizer, a spreader-bar made of angle-iron and adjustably secured to the front of a plow-beam, the upright side of said angle-iron cut down near the ends thereof, the end turned back on itself, and a pulley journaled at each end in the loop formed by said turned-back portions, substantially as shown and described.

3. In a draft-equalizer, a slotted plate secured to the front of a plow-beam, a spreader-bar secured to said plate through the slot therein, a pulley journaled at each end of said spreader-bar, an equalizing-lever having its ends bent toward the draft, and rods attached to said lever having flexible ends passing over said pulleys, substantially as shown and described.

4. In a draft-equalizer, a slotted plate secured to the front of a plow-beam, a spreader-bar made of angle-iron adjustably secured through the slot in said plate, brace-rods connecting brackets on said beam and said spreader-bar, the front side of said angle-iron cut down near its ends and having its flat portion bent back on itself, a pulley journaled in the loop formed by said turned-back portion, an equalizing-lever pivoted to a U-shaped clamp, the ends of said clamp cut down and screw-threaded, a plate perforated to fit over said threaded portions and fastened by nuts, the ends of said equalizing-lever bent toward the draft and downward, a draft-rod attached to each end of said lever and having a flexible end to pass over a pulley at the end of the spreader-bar, and means attached to said flexible ends to attach thereto a whiffletree, substantially as shown and described.

709,098. MILK OR CREAM DEODORIZER. HENRY R. HOWE, Rockford, Ill., assignor of one-half to Henry W. Carmichael, Rockford, Ill. Filed Nov. 11, 1901. Serial No. 81,833. (No model.)

Claim.—1. In an apparatus for deodorizing milk or cream, in combination, a closed drum having an air-inlet opening, an air-outlet opening, and a liquid-inlet opening; means for producing a strong current of air through the air-inlet opening; and an imperforate impinging surface for said liquid and said air-current.

2. In an apparatus for deodorizing milk or cream, in combination, a closed drum having an air-inlet opening, an air-outlet opening, a liquid-inlet opening, and a liquid-outlet opening; means for producing a strong current of air through the air-inlet opening; and an imperforate impinging surface for said liquid and said air-current.

3. In an apparatus for deodorizing milk or cream, in combination, a closed drum having an air-inlet opening in one side thereof, an air-outlet opening in its opposite side, and a liquid-inlet opening near said air-inlet opening; an imperforate impinging surface within said drum opposite said air-inlet opening; and means for producing a strong current of air through the air-inlet opening.

4. In an apparatus for deodorizing milk or cream, in combination, a closed drum having an air-inlet opening near one side thereof, an air-outlet opening in its opposite side, and a liquid-inlet opening adjacent to said air-inlet opening, one wall of said drum being curved to form an impinging surface for the liquid; and means for producing a strong current of air through the air-inlet opening.

5. In an apparatus for deodorizing milk or cream, in combination, a closed drum having an air-inlet opening in one side thereof, an air-outlet opening near the opposite side of said drum, and a liquid-inlet opening adjacent to said air-inlet opening, said liquid-inlet opening comprising a number of fine perforations through the wall of said drum; a pipe for said outlet-opening; the upper wall of said drum being inclined upward at the forward side of the drum and curved downward near the rear side thereof, said curved portion of the upper wall constituting within the drum an impinging surface for the liquid; and means for producing a strong current of air through the air-inlet opening.

709,094. PROCESS OF DEODORIZING MILK OR CREAM. HENRY R. HOWE, Rockford, Ill., assignor of one-half to Henry W. Carmichael, Rockford, Ill. Filed Jan. 20, 1902. Serial No. 91,197. (No specimens.)

Claim.—1. The process of deodorizing milk or cream, consisting in heating said milk or cream to a temperature ranging from 100° to 155° Fahrenheit, and disintegrating said milk or cream by means of a blast of pure air.

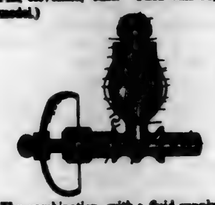
2. The process of deodorizing milk or cream, consisting in heating said milk or cream to a temperature ranging from 135° to 140° Fahrenheit, and disintegrating said milk or cream by means of a blast of pure air.

709,095. CANE. JOHN S. JUDY, Middletown, Pa. Filed Nov. 20, 1901. Serial No. 83,015. (No model.)

Claim.—1. A cane having a ferrule including a socket portion in which the end of the body of the cane is held and a tubular lower portion spaced downwardly from the socket portion and connected thereto by means of a neck both ends of the tubular portion being open, said tubular portion being adapted to receive an upwardly-directed shell or cap in its lower end, and the lower end of the socket portion having an outwardly and downwardly directed flange projecting beyond the tubular portion, said flange being spaced from the upper end of the tubular portion and disposed in the path of discharge therefrom to receive the gases from the tubular portion and deflect them downwardly.

2. A cane comprising a body portion and a ferrule portion in which the body portion is engaged, the ferrule having a socket which receives the body portion and an open-ended tubular lower portion connected to the socket portion and spaced downwardly therefrom, and adapted to receive a shell to discharge its gases upwardly through the tubular portion, the socket portion having an outwardly and downwardly projecting reasoning-flange extending outwardly beyond the tubular portion, said flange being spaced from the upper end of the tubular portion and disposed in the path of discharge therefrom to receive the gases of explosion therefrom and deflect them downwardly.

709,096. VALVE MECHANISM FOR FLUID-SUPPLY PIPES. ADAM S. KEMPE, Cleveland, Ohio. Filed Jan. 31, 1902. Serial No. 91,661. (No model.)

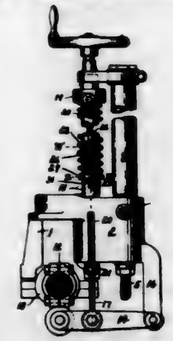


Claim.—1. The combination, with a fluid-supply pipe, of a tubular valve-casing extending through and transversely of the said pipe and provided, within the pipe, with an induction-port communicating with the interior of the pipe, which valve-casing is provided externally of the pipe with a discharge-orifice and has a passage-way connecting the said orifice with the aforesaid port; a valve in the said passage-way; another valve arranged to regulate the supply of fluid to the said passage-way from the aforesaid port; two clamping members arranged externally of the pipe and directly opposite each other and partially embracing the pipe, packing-forming washers surrounding the valve-casing and interposed between the clamping members and the pipe, and means for causing the said clamping members to bear against the pipe.

2. The combination, with a fluid-supply pipe, of a tubular valve-casing extending through and transversely of the said pipe and provided within the pipe, with an induction-port communicating with the interior of the pipe, which valve-casing is provided, externally of the pipe, with a discharge-orifice and has a passage-way connecting the said orifice with the aforesaid port; a valve in the said passage-way; another valve arranged to regulate the supply of fluid to the said passage-way from the aforesaid port; two clamping members arranged externally of the pipe and directly opposite each other, with one of the said clamping members in the form of an annular flange formed upon and partially embracing the pipe, and with the other clamping member in the form of a collar embracing the valve-casing and having lips or flanges partially embracing the pipe; packing-forming washers surrounding the valve-casing and interposed between the clamping members and the pipe; and a nut screwed onto the valve-casing at the outer end of the collar-forming clamping member, substantially as and for the purpose set forth.

3. The combination, with a fluid-supply pipe, of a tubular valve-casing extending through and transversely of the said pipe and provided, within the pipe, with an induction-port communicating with the interior of the pipe, which valve-casing is provided, externally of the pipe, with a discharge-orifice and has a passage-way connecting the said orifice with the aforesaid port; a valve in the said passage-way; two clamping members arranged to bear against and externally of the pipe and directly opposite each other, with one of the said clamping members rigid with the valve-casing and with the other clamping member in the form of a collar embracing the valve-casing; packing-forming washers surrounding the valve-casing and interposed between the clamping members and the pipe; means causing the said clamping members to bear against the pipe; a screw screwed into and extending longitudinally of the valve-casing and having its inner end forming a valve arranged to regulate the supply of fluid to the aforesaid passage-way from the aforesaid port, and means closing the end of the valve-casing at the outer end of the screw and forming a fluid-tight joint at the said end of the valve-casing.

709,097. LUBRICANT APPARATUS FOR THE DIES OF BRICK-MACHINES. HOWARD E. KIRK, Philadelphia, Pa., assignor to Chambers Brothers Company, Philadelphia, Pa., a Corporation of Pennsylvania. Filed Sept. 20, 1899. Serial No. 807,338. (No model.)



Claim.—1. In a machine or apparatus of the character and for the purpose recited, the combination of the piston adapted to work in a suitable chamber, the inlet and outlet openings in the latter, the respective check-valves therein, the air-chamber communicating with said outlet-opening, and adapted to communicate with the die of a brick-machine or the like, the pivoted arm connected to the piston, the post mounted above the latter, the screw-threaded rod therein, the nut on said rod provided with the projecting lugs, the sleeve on said post and connected with the piston, the tension-spring between said sleeve and lugs, together with the rotatable shaft and the eccentric thereon adapted to impinge against the said arm, during a part of each revolution of the shaft and thereby actuate the piston against the stress of said spring, substantially as and for the purpose set forth.

2. In an apparatus of the character described, the combination with a piston-chamber, of a piston arranged and adapted to reciprocate therein, a shaft, an operating device carried by said shaft, a pivoted arm connected

to said piston and adapted to be contacted by said operating device for actuating the piston in one direction, a post carried by the piston-chamber, a sleeve encircling said post and slidably mounted thereon, a spring also encircling said post and exerting its tension to force said sleeve away from the piston-chamber, and rods carried by said sleeve and connected to the piston, whereby said spring is adapted to operate said piston in opposition to the actuation of the operating device.

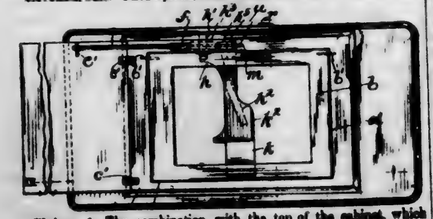
3. In an apparatus of the character described, the combination with a piston-chamber, of a piston arranged and adapted to reciprocate therein, a shaft, an operating device carried by said shaft, a pivoted arm connected to said piston and adapted to be contacted by said operating device for actuating the piston in one direction, a post carried by the piston-chamber, a sleeve encircling said post and slidably mounted thereon, a spring also encircling said post and exerting its tension to force said sleeve away from the piston-chamber, rods carried by said sleeve and connected to the piston, whereby said spring is adapted to operate said piston in opposition to the actuation of the operating device, and means for regulating the tension of said spring.

4. In an apparatus of the character described, the combination with a piston-chamber, of a piston arranged and adapted to reciprocate therein, a shaft, an operating device carried by said shaft, a pivoted arm connected to said piston and adapted to be contacted by said operating device for actuating the piston in one direction, a tubular post carried by the piston-chamber and provided at its sides with slots, a sleeve encircling said post and slidably mounted thereon, a threaded rod rotatably mounted in said post, a nut mounted upon said rod and provided with lugs projecting through the slots of said post, a spring encircling said post and interposed between said sleeve and the lugs of said nut, said spring exerting its tension to force said sleeve away from the piston-chamber, and connections between said sleeve and the piston, whereby said spring is adapted to operate said piston in opposition to the actuation of the operating device.

5. In an apparatus of the character described, the combination with a piston-chamber, of a piston arranged and adapted to reciprocate therein, a shaft, an operating device carried by said shaft, a pivoted arm connected to said piston and adapted to be contacted by said operating device for actuating the piston in one direction, a tubular post carried by the piston-chamber and provided in its sides with slots, a sleeve encircling said post and slidably mounted thereon, a threaded rod rotatably mounted in said post, a hand-wheel carried by said rod for rotating the same, a nut mounted upon said rod and provided with lugs projecting through the slots of said post, a spring encircling said post and interposed between said sleeve and the lugs of said nut, said spring exerting its tension to force said sleeve away from the piston-chamber, and connections between said sleeve and the piston, whereby said spring is adapted to operate said piston in opposition to the actuation of the operating device.

6. In an apparatus of the character described, the combination with a piston-chamber having inlet and outlet valves, and an air-chamber mounted on said piston-chamber, of a piston arranged and adapted to reciprocate in the piston-chamber, a shaft, an operating device carried by said shaft, a pivoted arm connected to said piston and adapted to be contacted by said operating device for actuating the piston in one direction, a tubular post carried by the piston-chamber and provided in its sides with slots, a sleeve encircling said post and slidably mounted thereon, a threaded rod rotatably mounted in said post, a threaded nut mounted upon said rod and provided with lugs projecting through the slots of said post, a spring encircling said post and interposed between said sleeve and the lugs of said nut, said spring exerting its tension to force said sleeve away from the piston-chamber, and connections between said sleeve and the piston, whereby said spring is adapted to operate said piston in opposition to the actuation of the operating device.

709,098. MACHINE-BEARING CABINET. THEODOR KNUDTS, Cleveland, Ohio. Filed Apr. 14, 1902. Serial No. 103,209. (No model.)



Claim.—1. The combination, with the top of the cabinet, which top has an opening extending vertically therethrough, a stationary back below the top rearward of the said opening; a tilting leaf supported from the top and arranged to tilt about a horizontal axis and to occupy the aforesaid opening in its upwardly-tilted position, and the tilting leaf hinged to the top horizontally and transversely of the cabinet at one side of the aforesaid opening, of a lever fulcrumed horizontally and transversely of the cabinet to the aforesaid back a suitable distance below the top and having an arm extending in under and transversely of and instrumental in supporting the first-mentioned leaf, which lever has a brace-forming arm arranged next to the inner side of the aforesaid back, and an operative connection between the said lever and the aforesaid lifting leaf.

2. The combination, with the top of the cabinet, which top has an opening extending vertically therethrough; a stationary back below the top rearward of the said opening; a leaf pivoted, near its rear edge, to the top horizontally and longitudinally of the cabinet; a bar arranged transversely of the under side of and secured to the said leaf, and a lifting leaf hinged to the top horizontally and transversely of the cabinet at the left-hand side of the aforesaid opening, of a lever fulcrumed horizontally and transversely of the cabinet to the aforesaid back a suitable distance below the top and having a forwardly-projecting arm extending in under and engaging the under side of the aforesaid bar, which lever has a brace-forming arm arranged diametrically opposite the first-mentioned arm next to the inner side of the aforesaid back, and is provided with a cable-guiding flange A^3 and a centrally-perforated lug A^4; an endwise-shiftable externally-screw-threaded pin extending through the perforation in the said lug; a cable operatively attached, at one end, to the lifting leaf a suitable distance from the axial line c' the leaf and operatively connected with the aforesaid pin at the adjacent end of the aforesaid lug; a nut upon the said pin at the opposite end of the said lug; a compressible and elastic sleeve upon the pin between the nut and the lug, and a guide-sheave engaging the aforesaid cable and arranged between the said pin and the aforesaid lifting leaf.

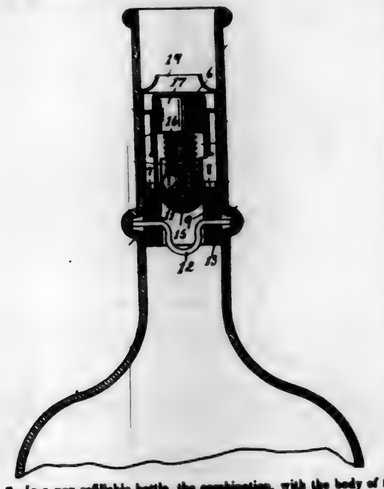
3. The combination, with the top of the cabinet, which top has an opening extending vertically therethrough, and a stationary back below the top rearward of the said opening; a tilting leaf supported from the top and arranged to tilt about a horizontal axis and to occupy the aforesaid opening in its upwardly-tilted position, and the tilting leaf hinged to the top horizontally and transversely of the cabinet at one side of the aforesaid opening, of a lever fulcrumed horizontally and transversely of the cabinet to the aforesaid back a suitable distance below the top and having an arm extending in under and transversely of and instrumental in supporting the first-mentioned leaf, a cable-guiding flange A^3 and a perforated lug A^4, formed upon the said lever, an endwise-shiftable externally-screw-threaded pin extending loosely through the perforation in the said lug; a cable operatively attached, at one end, to the lifting leaf, and operatively connected with the aforesaid pin at the adjacent end of the aforesaid lug; a nut upon the said pin at the opposite end of the said lug; a compressible and elastic sleeve upon the pin between the nut and the lug, and a guide-sheave engaging the aforesaid cable and arranged between the said pin and the aforesaid lifting leaf.

4. The combination, with the top of the cabinet, which top has an opening extending vertically therethrough, and a stationary back below the top rearward of the said opening; a leaf pivoted, near its rear edge, to the top horizontally and longitudinally of the cabinet; a bar arranged transversely of the under side of and secured to the said leaf, and a lifting leaf hinged to the top horizontally and transversely of the cabinet and the left-hand side of the aforesaid opening, of a lever fulcrumed horizontally and transversely of the cabinet to the aforesaid back a suitable distance below the top and having a forwardly-projecting arm extending in under and engaging the under side of the aforesaid bar, which lever has a brace-forming arm arranged diametrically opposite the first-mentioned arm next to the inner side of the aforesaid back, and is provided with a cable-guiding flange A^3 and a centrally-perforated lug A^4; an endwise-shiftable externally-screw-threaded pin extending through the perforation in the said lug; a cable operatively attached, at one end, to the lifting leaf a suitable distance from the axial line c' the leaf and operatively connected with the aforesaid pin at the adjacent end of the aforesaid lug; a nut upon the said pin at the opposite end of the said lug; a compressible and elastic sleeve upon the pin between the nut and the lug, and a guide-sheave engaging the aforesaid cable and arranged between the said pin and the aforesaid lifting leaf.

5. The combination, with the top of the cabinet, which top has an opening extending vertically therethrough; a stationary back below the rear portion of the top rearward of the said opening; a leaf pivoted, near its rear edge, to the top horizontally and longitudinally of the cabinet; a bar k arranged transversely of the under side of and secured to the said leaf centrally between the ends of the leaf, and a lifting leaf hinged to the top transversely of the cabinet, of a lever fulcrumed horizontally and transversely of the cabinet to the aforesaid back a suitable distance below the rear portion of the top and having an arm extending forwardly in under and engaging the under side of the aforesaid bar, which lever has a brace-forming arm arranged to engage the inner side of the aforesaid back, and an operative connection between the said lever and the aforesaid lifting leaf.

709,099. NON-REFILLABLE BOTTLE. WILLIAM G. LAWRENCE, Oakland, Cal. Filed Jan. 27, 1902. Serial No. 91,510. (No model.)

Claim.—1. In a non-refillable bottle the combination, with the body of the bottle, of a stopper having inner and outer tubular walls, the inner tube being apertured in its lower portion and having a valve-seat for a ball-valve, a ball on said seat, a float within the inner tube, and a spring between said float and ball, the inner tube being closed at its upper end, and the annulus between the upper ends of the tubes being open, substantially as described.

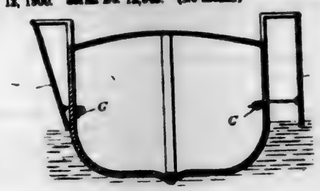


2. In a non-refillable bottle, the combination, with the body of the bottle, of a stopper having inner and outer tubular walls, the inner tube being apertured in its lower portion and having a valve-seat for a ball-valve, a ball on said seat, a float within the inner tube, a spring between said float and ball, the inner tube being closed at its upper end and the annulus between the upper ends of the tubes being open, and a series of broken annular fences extending transversely of the stopper between the inner and outer walls, the breaks or openings in successive fences being out of alinement, whereby a circuitous path is formed from an opening in the upper end of the stopper to one in the lower portion of the inner tube, substantially as described.

3. In a non-refillable bottle, the combination, with the body of the bottle, of a stopper having inner and outer tubular walls, the inner tube being apertured in its lower portion and having a valve-seat for a ball-valve, a ball on said seat, a float within the inner tube, a spring between said float and tube, the inner tube being closed at its upper end and the annulus between the upper ends of the tubes being open, a series of broken annular fences extending transversely of the stopper between the inner and outer walls, the breaks or openings in successive fences being out of alinement, whereby a circuitous path is formed from an opening in the upper end of the stopper to one in the lower portion of the inner tube, and means for automatically locking the stoppers to the bottle, substantially as described.

4. A non-refillable bottle, the combination, with the body of the bottle, of a stopper having inner and outer tubular walls, the outer wall having a rim fitting snugly within the neck and having a cork layer below said rim, the inner tube being apertured in its lower portion and having a valve-seat for a ball-valve, a ball in said seat, a float within the inner tube, a spring between said float and ball, the inner tube being closed at its upper end and the annulus between the upper ends of the tubes being open, and a series of broken annular fences extending transversely of the stopper between the inner and outer walls, the breaks or openings in successive fences being out of alinement, whereby a circuitous path is formed from an opening in the upper end of the stopper to one in the lower portion of the inner tube, substantially as described.

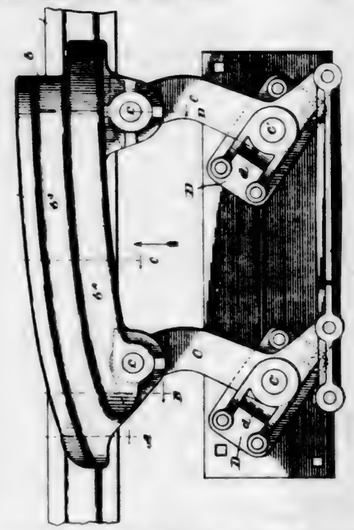
709,100. PROTECTION AGAINST SHOT FROM HAND FIRE-ARMS AND ARTILLERY. ADOLPH LEVER, Cologne, Germany. Filed Apr. 12, 1900. Serial No. 12,662. (No model.)



Claim.—1. A screen or barrier, for protection against projectiles constructed to present a surface of different degrees of resistance to the piercing force of the projectile, whereby the projectile will be given a rotation in the plane of its longitudinal axis; substantially as described.

2. A screen or barrier for protection against projectiles, consisting of a perforated metal plate.

709,101. DERAILER. GEORGE L. MANSFIELD, Chicago, Ill., assignor of one-half to Henry F. Baldwin, Chicago, Ill. Filed May 26, 1902. Serial No. 108,935. (No model.)



Claim.—1. The combination with the track-rail, of a derailing-rail adapted to rest thereon, the latter shaped to engage and guide the wheel, and mechanism engaged to the derailing-rail adapted to move the entire derailing-rail away from the track-rail in substantially a horizontal plane.

2. The combination with the track-rail, of a derailing-rail adapted to rest thereon, the latter shaped to engage and guide the wheel, and means engaged to each end of the derailing-rail adapted to move the same away from the track-rail in substantially a horizontal plane.

3. The combination with the track-rail, of a derailing-rail adapted to rest thereon, the latter shaped to engage and guide the wheel, and two pivoted levers adapted to swing in substantially a horizontal plane, pivoted to said derailing-rail and adapted to swing the latter away from the track-rail.

4. The combination with the track-rail, of a derailing-rail shaped on its upper side to engage and guide the wheel, and means for swinging the derailing-rail in substantially a horizontal plane away from the track-rail, said entire derailing-rail shaped so that a portion may rest on the track-rail while another portion bears against the side of the track-rail and forms a stop to limit the movement of the derailing-rail as the latter is swung to its operative position.

5. The combination with the track-rail of a derailing-rail, two pivoted levers pivoted to said derailing-rail for swinging it clear of the track-rail, and a connection between the levers.

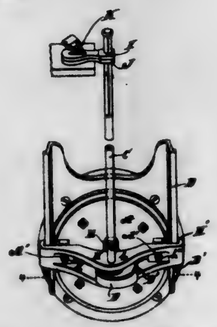
6. A derailing-rail shaped to rest on the track-rail and provided on its upper side with a portion to receive the tread of the wheel and a groove to receive the flange of the wheel, said groove being more shallow at one end with respect to the portion that receives the tread, so that the flange of the wheel when it reaches the said end will ride on the bottom of the groove.

7. The combination with the track-rail, of a derailing-rail adapted to rest thereon, the latter shaped to engage and guide the wheel, and means engaged to each end of the derailing-rail adapted to move the same away from the track-rail.

709,102. WATER-GATE. JOSEPH H. MARTIN and DAVID ORMAND, Riverside, Cal. Filed Mar. 24, 1902. Serial No. 99,811. (No model.)

Claim.—1. A water-gate for use in an irrigating system, compris-

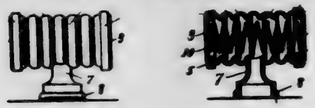
ing the gate-plate slidably mounted on the end of an irrigating pipe-line and movably connected with a sliding bracket, a sliding bracket having means to engage a vertical flanged guideway, a vertical flanged guideway secured to the end of the pipe-line and having an opening therein to register with the opening in the pipe-line, the portion of the flanged guide surrounding the opening forming the seat for the gate, a vertical stem journaled in the sliding bracket, a cam keyed to said stem and having flanges thereon adapted to engage flanges on the flanged guide; a flanged guide secured to the face-plate and means to rotate said stem to open and close the gate.



2. A water-gate of the character herein described comprising the cam D keyed to the stem C the said cam provided with guide-engaging flanges D', a sliding bracket H carrying said cam, the said stem being journaled in said bracket, the gate-plate A having secured thereto a flanged guide E adapted to engage the flanges on the cam, whereby the rotation of the operating-stem will cause the gate-plate to move to or from the stem substantially as shown and described.

3. In a vertically-sliding water-gate of the character herein described, means to limit the downward movement of the gate-plate, and hold the same in register with the seat in the gate, comprising a flanged guide-plate B having catches B' thereon a bracket H adapted to contact with said catch, the said bracket having perforations A'' therethrough, the gate-plate being provided with the projecting tests A' adapted to enter into the perforations A'' in the bracket, the face-plate being provided also with projecting tests *a*; recesses *b* in the flanged guide B to hold the tests when the gate-plate is seated substantially as shown and described.

709,108. MASSAGING DEVICE. CHARLES H. MAGEE, San Francisco, Cal. Filed Jan. 13, 1902. Serial No. 90,024. (No model.)



Claim.—1. A massage device comprising a vacuum-chamber having two end walls and a flexible cylindrical wall joining said end walls, a spring acting between said end walls to separate them, a non-collapsible suction-mouth, a flexible neck connecting said mouth directly with said flexible wall, substantially as described.

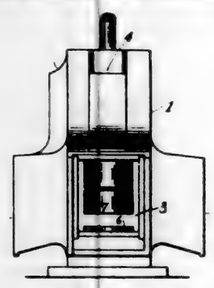
2. A massage device comprising a vacuum-chamber having two end walls and a flexible cylindrical wall corrugated longitudinally joining said end walls, a spring acting between said end walls to separate them, a non-collapsible suction-mouth, and a flexible neck connecting said mouth directly with said flexible wall, substantially as described.

3. A massage device comprising a vacuum-chamber having two end walls and a flexible cylindrical wall joining said end walls, a spring acting between said end walls to separate them, a non-collapsible suction-mouth, and a short flexible neck connecting said mouth directly with said flexible wall and made in one piece therewith, substantially as described.

709,104. STAMP-MILL MORTAR. WILLIAM A. MEREALLS, San Francisco, Cal. Filed Sept. 20, 1901. Serial No. 75,961. (No model.)

Claim.—1. A stamp-mill mortar provided with stationary means for feeding the ore onto the die from the outside inward simultaneously from two opposite directions, whereby the ore is fed evenly upon the die, substantially as described.

2. A stamp-mill mortar provided with stationary means for feeding the ore onto the die inward simultaneously from all sides of the mortar, whereby the ore is fed evenly upon the die, substantially as described.



709,105. CATTLE-GUARD. MARTIN L. MILLER, Sealy, Tex., assignor of one-third to W. I. Hill, Sealy, Tex. Filed June 28, 1901. Serial No. 66,449. (No model.)

Claim.—1. In a cattle-guard, the combination with a pivoted upwardly-movable barrier member, of a pivoted downwardly-movable operating member, a depending arm carried by the operating member, a depending arm carried by the barrier member, and a single link pivotally connecting the arms of the members and movable therewith.

2. In a cattle-guard, the combination with a pivoted upwardly-movable barrier member, of a pivoted downwardly-movable operating member, a depending arm carried by the operating member, and a link having a pivotal connection with the arm, said link being pivotally connected to the barrier member.

3. In a cattle-guard, the combination with a pivoted upwardly-movable barrier member, of a pivoted downwardly-movable operating member, depending arms carried by the two members, the arm of the operating member being longer than that of the barrier member and a link secured directly to said arms to simultaneously move them upon the depression of the operating member.

4. In a cattle-guard, the combination with a pair of independent members movable in a downward and upward direction, of separate links pivotally connected with the members, each link having a slidable engagement with one member.

5. In a cattle-guard, the combination with a pair of independent members movable in a downward and upward direction, each of said members having a depending arm, of links each being connected with one of the members and having a pivotal connection with the arm of the other member.

6. In a cattle-guard, the combination with a pair of independent members movable in a downward and upward direction, each of said members having a depending arm, and links each being connected with one of the members, and having a pivotal and slidable connection with the arm of the other member.

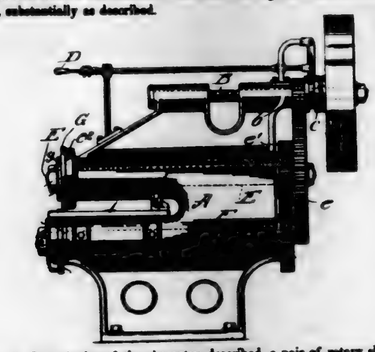
7. In a cattle-guard, the combination with a pair of independent members movable in a downward and upward direction, each of said members having depending long and short arms and a link pivotally connected at one end with the short arm of one member, the other end having a pivotal and slidable connection with the long arm of the other member.

8. In a cattle-guard, a tilting platform having a plurality of fulcrums, and means arranged to engage the fulcrums to limit the tilting movement of the platform.

9. In a cattle-guard, a tilting platform having a plurality of fulcrum-shafts projecting beyond the side edges thereof, a plurality of bearings for the projecting ends of the fulcrum-shafts and stop-hooks located at the ends and above the bearings, said fulcrum-shafts engaging the hooks to limit the tilting movement of the platform.

709,106. ROTARY SHEARS. GEORGE W. MUDD, Moberly, Mo. Filed May 9, 1901. Serial No. 59,412. (No model.)

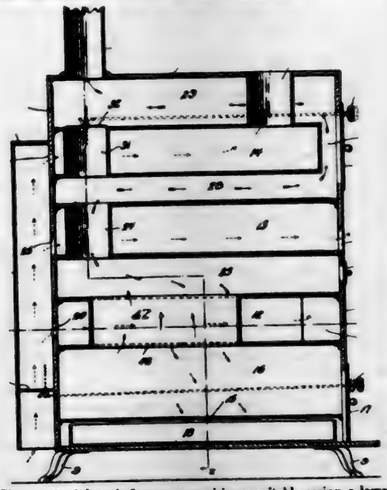
Claim.—1. In a device of the character described, a pair of rotary shears, a stationary bed I occupying a plane therebetween, a shoe K on the said bed adjacent to said rotary shears, a plurality of guide-rollers, and means for adjusting said rollers on the stationary bed transversely to the line of feed of the material to facilitate cutting material on a curved line, substantially as described.



2. In a device of the character described, a pair of rotary shears, a stationary table-bed I occupying a plane therebetween, a series of guide-rollers arranged adjacent to said rotary shears, and means for adjusting said rollers on the stationary bed transversely to the line of feed of the material, to facilitate cutting material on a curved line, substantially as described.

3. In a machine of the character described, a pair of shears, a bed occupying a plane therebetween, a series of guide-rollers arranged adjacent to the line of feed from the machine, and means for adjusting said rollers on the bed transversely to said line of feed to facilitate the cutting of material on a curved line, substantially as described.

709,107. FURNACE. DONALD S. MCDONALD, Mabou, Canada. Filed Jan. 10, 1902. Serial No. 89,109. (No model.)



Claim.—1. A hot-air furnace comprising a suitable casing, a lower hot-air box having side and central smoke-flues traversing it and having a cold-air inlet and a hot-air outlet, an upper hot-air box having a smoke-tube and a hot-air outlet as well as a cold-air inlet, an intermediate hot-air box having a smoke-tube and air inlet and outlet, and a damper arranged in operative relation to the smoke-tube of the upper box, substantially as described.

2. A hot-air furnace comprising a rectangular casing, a series of hot-air boxes having horizontal flat top and bottom sides traversing the casing, each box having a cold-air inlet at one end and a hot-air outlet at the other, a fire-chamber located at the bottom of the casing, flue-chambers located between the boxes and above the uppermost one thereof, smoke-passages connecting the successive flue-chambers at opposite sides of the casing whereby to cause an alternating circulation of the flue-gases back and forth, a flue connection connecting the last one of said flue-chambers only with the chimney, and an alternative passage-way for the flue-gases having a damper therein and located immediately beneath said flue connection connecting the last two flue-chambers, whereby to regulate the circulation of the flue-gases.

3. A hot-air furnace comprising a rectangular casing, a series of hot-air boxes having horizontal top and bottom sides traversing the casing, each box having a cold-air inlet at one end and a hot-air outlet at the other, a fire-chamber located at the bottom of the casing, flue-chambers located between the boxes and above the uppermost one thereof, smoke-passages connecting the successive flue-chambers at opposite sides of the casing whereby to cause an alternating circulation of the flue-gases back and forth, a flue connection connecting the last one of said flue-chambers only with the chimney, an alternative passage-way for the flue-gases having a damper therein and located immediately beneath said flue connection connecting the last two flue-chambers, whereby to regulate the circulation of the flue-gases, and doors formed opposite each of said flue-chambers.

4. A hot-air furnace comprising a rectangular casing, a series of hot-air boxes having horizontal top and bottom sides traversing the casing, each box having a cold-air inlet at one end and a hot-air outlet at the other, a fire-chamber located at the bottom of the casing, flue-chambers located between the boxes and above the uppermost one thereof, smoke-passages connecting the successive flue-chambers at opposite sides of the casing whereby to cause an alternating circulation of the flue-gases back and forth, a flue connection connecting the last one of said flue-chambers only with the chimney, an alternative passage-way for the flue-gases having a damper therein and located immediately beneath said flue connection connecting the last two flue-chambers, whereby to regulate the circulation of the flue-gases, doors formed opposite each of said flue-chambers, and a cold-air-inlet box comprising a passage-way formed on the exterior rear wall of the casing and connecting the inlet-openings of said hot-air boxes, substantially as described.

709,108. FERRULE FOR FORK-HANDLES. GEORGE A. MCKEE, Jackson, Mich. Filed June 23, 1902. Serial No. 112,747. (No model.)

Claim.—1. In a device of the class described, the combination with a handle and a fork driven thereinto, of a strap-ferrule, composed of a tapered ferrule, a second tapered ferrule, having strap extensions thereon, the lower portion thereof being driven over the upper end of said first-named ferrule, and a third cup-shaped ferrule having a slot therein, driven over the lower end of said first-named ferrule, substantially as shown and described.

2. In a device of the class described, the combination with a fork-handle and a fork driven thereinto, of a strap-ferrule, composed of a tapered ferrule having an enlargement at its upper end, and driven into a second ferrule, correspondingly reduced at its lower end, and having strap extensions at its upper end, and a slotted cup-shaped ferrule driven over the lower end of said first-named ferrule, substantially as shown and described.

3. In a device of the class described, the combination with a fork-handle and a fork driven therein, of a strap-ferrule upon the end of said handle composed of a main ferrule, a second ferrule driven upon the upper end of said first-named ferrule, forming a double thickness at the upper end of said first-named ferrule, said second ferrule having strap extensions for attaching the ferrule to the handle, and a third ferrule formed in the shape of a cup, with a slot in the end thereof, as shown and driven upon the lower end of said first-named ferrule, forming a double thickness at the lower end of said first-named ferrule, substantially as shown, and for the purposes described.

4. In a device of the class described, the combination with a strap-ferrule, composed of a tapered ferrule, and a second tapered ferrule having strap extensions thereon, and adapted to be driven upon the upper end of said first-named ferrule forming a double thickness of ferrule at the upper end thereof, and also forming a shoulder against which the shoulder upon the handle will rest, of a handle having the end turned and tapered to fit the internal surface of said first-named ferrule, the portion adjacent thereto being turned to fit the second-named ferrule, with a shoulder between said two portions to coincide with the shoulder formed at the upper end of said first-named ferrule.

5. As a new article of manufacture, a strap ferrule, composed of a tapered ferrule, having an enlargement at the upper end, a second ferrule having strap extensions at its upper end, and its lower end tapered and

shaped to conform to the contour of the upper end of said first-named ferrule, and a cup-shaped slotted cap over the lower end of said first-named ferrule.

6. As a new article of manufacture, a long tapered strap-ferrule, for fork-handles, composed of a thick tapered ferrule having an enlargement at its upper end, and a long strap-ferrule tapered to conform to the contour of the upper end of said first-named ferrule, and adapted to be driven thereon forming an extra-long seamless tapered strap-ferrule, with a double thickness at the portion where the handle is to be driven therein, substantially as shown and described.

7. As a new article of manufacture, a double-strap ferrule for fork and other handles, composed of an inner tapered ferrule, of the desired length and thickness, and having an outwardly-extending projection at its upper end engaging with the inwardly-projecting extension on the outer ferrule, and an outer strap-ferrule having an inwardly-extending projection at its lower end engaging the extension on said inner ferrule, and preventing said inner ferrule from becoming disengaged from said outer ferrule, said outer ferrule being tapered to conform approximately to the taper of said inner ferrule, and said two ferrules forming a double thickness of ferrule at the portion requiring the greatest strength therein, substantially as shown and described.

8. In a device of the class described, the combination with a tool having a shank, of a cup-shaped member adapted to embrace the tool and its shank, a handle adapted to receive said shank, a ferrule mounted upon the lower end of the handle and adapted to rest within said cup-shaped member, and a second ferrule mounted upon the handle and adapted to embrace the upper end of the first-mentioned ferrule.

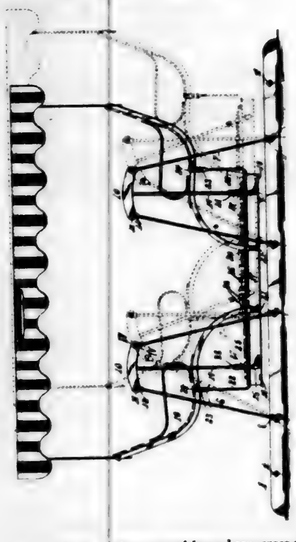
709,109. CLOTHES-POUNDER. KENNETH D. MCLAY, Dauphin, Canada. Filed June 13, 1901. Serial No. 64,962. (No model.)

Claim.—As an improved article of manufacture, the clothes-pounder herein described comprising an imperforate conical shell, a separate inner conical shell concentric therewith with the lower edge of its conical portion terminating in a horizontal plane with the lower edge of the first-mentioned shell, the said inner shell being provided near its upper end with openings and formed with a circumferential vertical walled foot-flange of less diameter than the bottom of the outer shell and extended beyond the lower edge of the latter and having its bottom edge rolled outward and upon itself, a socket-tube uniting the upper ends of the two shells, and an annular horizontal plate secured to the lower edge of the outer shell and to the inner shell at the point of junction of its conical portion and foot-flange and having perforations communicating with the space between the two shells, all substantially as shown and described and for the purpose specified.

709,110. LAWN OR HOUSE SWING. OLAF R. OLSON, Kansas City, Mo., assignor to Horizontal Swing Co., Kansas City, Mo., a Corporation of Missouri. Filed May 27, 1901. Serial No. 62,606. (No model.)

Claim.—1. A lawn or house swing, comprising standards pivoted to swing back and forth at their upper ends, links pivotally connecting the upper ends of the standards and provided with rigid depending stems, a platform pivotally carried by said stems, a chair rigidly mounted on said platform, and a foot-lever platform pivotally suspended from said stems, substantially as described.

2. A lawn or house swing, comprising standards pivoted to swing at their upper ends, links pivotally connecting their upper ends, a stem depending rigidly from each link, a frame pivotally attached to said stems, chairs rigidly mounted on said frame, a foot-lever platform, and brackets secured rigidly to and projecting from the same and pivoted at their upper ends to said stems, substantially as described.



3. A lawn or house swing, comprising a base, cross-rods mounted therein, standards connected at their lower ends to said rods to swing back and forth at the upper ends, links pivotally connecting the upper ends of said standards, stems rigidly depending from the links, a chair-carrying frame pivotally connected to the lower ends of said stems, and a foot-lever platform pivotally suspended from said stems, substantially as described.

4. A lawn or house swing, comprising a base, two sets of standards pivotally mounted on said base, links connecting the upper ends of the standards of each set, and provided with rigid depending stems, a horizontal frame pivotally attached to the lower ends of said stems near its opposite ends, chairs rigidly mounted on the opposite ends of said frame, and a foot-lever platform pivotally suspended from said stems, substantially as described.

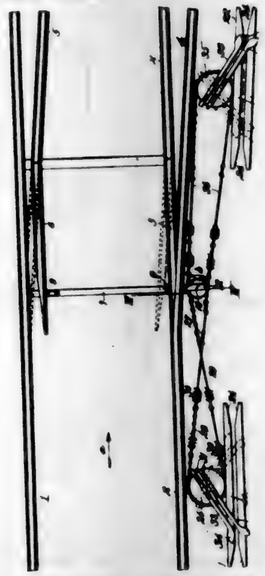
5. A lawn or house swing, comprising a base, two sets of standards pivotally mounted on said base, links connecting the upper ends of the standards of each set, and provided with rigid depending stems, a horizontal frame pivotally attached to the lower ends of said stems near its opposite ends, chairs rigidly mounted on the opposite ends of said frame, a foot-lever platform, and brackets secured to and projecting from the same, and pivoted to said stems above the chair-carrying frame, substantially as described.

6. In a swing, the side, the standards pivotally carried therein, the latter being widely separated at their pivotal ends and converging toward their upper ends, a link loosely connected at each end to one of the said standards, the arms rigidly secured in the links and depending therefrom, the platform suspended on the said arms, the seats carried on the platform and the foot-platform beneath the seats, and the hangers for carrying said foot-platform as set forth and all being arranged substantially in the manner and for the purpose herein described.

7. In a swing, a platform for carrying the seats, arms pivoted to said platform for carrying it, a supporting-frame for the swing, pivotal standards carried therein and converging toward their upper ends, a link to which said upper ends are pivoted, said standards pivoted at their lower ends and widely separated, the carrying-arms of said platform being rigidly secured to and hung from the links, the standards thus arranged adapted to limit the movement of the swing, as set forth.

8. In a swing, the combination of the standards supported pivotally at their lower ends and separated as shown and converging at their upper ends, a supporting-frame for carrying said standards at their lower ends, the links having one of the said standards pivoted at each end thereof, the depending arms secured to the links, the platform suspended on said arms, the seats on said platform and the foot-platform pivotally hung from the arms, all arranged substantially as and for the purposes set forth and described.

709,111. AUTOMATIC RAILWAY-SWITCH-OPERATING MECHANISM. LA FAYETTE PIERCE, Moundsville, Mo. Filed Jan. 3, 1902. Serial No. 88,264. (No model.)



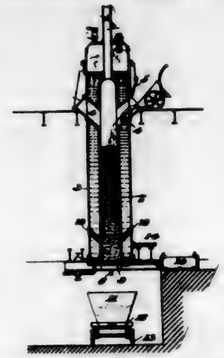
Claim.—1. In an automatic railway-switch-operating mechanism, the combination of main and side tracks, and a switch operating in conjunction therewith, of a wheel, a link pivotally connecting said wheel with said switch, train-operated means for rotating said wheel, a stop-plate having shoulders and a pin depending from said wheel and adapted to engage said shoulders alternately and when so engaged to occupy a position out of the vertical plane occupied by the axis of the wheel to the pivotal point of connection of the link with the switch.

2. In an automatic railway-switch-operating mechanism, the combination of main and side tracks, and a switch operating in conjunction therewith, of a wheel, a link pivotally connecting said wheel with said switch, wheels geared to the first-named wheel by flexible connections, one of said connections being a crossed connection, parallel levers secured to each wheel, ways parallel with the main and side tracks and each intersected by one of its levers or the other accordingly as the switch is opened or closed, an adjustable train-carried arm for passing successively through said ways, and operating said levers, causing the first one to open and the second one to close the switch, and means to limit the movement of the first-mentioned wheel to slightly more than a half-revolution, substantially as described.

3. In an automatic railway-switch-operating mechanism, the combination of main and side tracks, and a switch operating in conjunction therewith, of a sprocket-wheel, a link pivotally connecting said wheel with said switch, sprocket-wheels at opposite ends of the switch, a crossed and flexible connection connecting the first-named wheel and the sprocket-wheel at the main-track end of the switch, an endless connection between the first-named wheel and the other sprocket-wheel, said connections each consisting of chain-sections engaging the wheels, and wires or flexible rods connecting the chain-sections and provided with turnbuckles for tensioning the same, parallel levers secured to each wheel and having outwardly-curved and flaring ends, ways parallel with the main and side tracks and each intersected by one of its levers or the other accordingly as the switch is open or closed, an adjustable train-carried arm for passing successively through said ways, and operating said levers, causing the first one to open and the second one to close the switch, and means to limit the movement of the first-mentioned sprocket-wheel to slightly more than a half-revolution, substantially as described.

709,112. SLAG-HEATING APPARATUS. JOHN A. POTTER, Philadelphia, Pa. Filed July 5, 1901. Serial No. 67,267. (No model.)

Claim.—1. A slag-heater containing an inner vertically-extending slag-chamber, a shear-blade closing the lower end of said chamber, mechanism for reciprocating said shear-blade, and a stop or support below the blade and arranged to support the slag column with a portion thereof protruding below the slag-chamber; substantially as described.



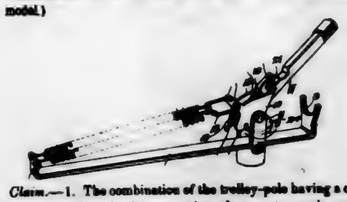
2. In a slag-heater, a hollow shell arranged to contain a fluid to be heated, and having an inner vertically-extending slag-chamber, feed-openings leading through the hollow shell to the slag-chamber, shearing mechanism arranged to cut off successive lower portions of the slag column and means for supporting the slag column with its lower portion protruding downwardly below the slag-chamber; substantially as described.

3. In a slag-heater, a hollow shell containing a vertically-extending slag-chamber, a shear-knife arranged to close the lower end of the chamber, mechanism for reciprocating the knife, a stop or support arranged to stop the column of slag with its lower portion projecting below the chamber, and a slag-receptacle below the said knife; substantially as described.

4. A slag-heater containing a slag-chamber, the cross-sectional area of which increases downwardly, means for supporting a slag column with its lower end portion projecting below the chamber, and a movable shear-blade arranged to close the lower end of the chamber; substantially as described.

5. In a steam-boiler, a hollow double shell containing an inner vertically-extending slag-chamber, slag-chutes leading through the outer shell to the upper part of the inner shell, a shear-blade arranged to close the lower end of the slag-chamber, a support arranged to hold a slag column with its lower portion below the lower end of the chamber, and mechanism for reciprocating the shear-blade, said boiler having steam and water connections; substantially as described.

709,113. TROLLEY-POLE. WILLIAM PULLMAN and CHARLES C. FIELD, Sodus, N. Y. Filed Dec. 16, 1901. Serial No. 86,173. (No model.)



Claim.—1. The combination of the trolley-pole having a cam adapted for contact with a fixed base, a pivoted support carrying said pole, a locking-bolt for holding the trolley-pole in operative position, the lower portion of said bolt being adapted for contact with a fixed point to effect its movement to a releasing position.

2. The combination of the trolley-pole, a support to which said pole is pivotally connected, a cam carried by said pole and adapted for contact with a fixed plate or base, pivotal supports for said trolley-pole support, and means for locking the trolley-pole to said support.

3. The combination of the trolley-pole having a cam on its lower face adapted for contact with a fixed surface, a pivoted support to which said pole is fulcrumed, means for locking the pole and support, and means for disengaging the pole and support by any abnormal forward movement of the trolley-pole.

4. The combination of the carrier, a pivotal support for said carrier, a trolley-pole pivotally connected to said support at a point in advance of

the pivot-points of the carrier, means for locking the pole to its support, a spring normally tending to hold the support and pole in operative position, and a cam carried by the pole and adapted to move the support when released therefrom to such a position as to connect the springs to the pole and check the falling movement thereof, substantially as specified.

5. The combination of the trolley-pole, a carrier adapted to be locked thereto and to be automatically released therefrom on any abnormal forward movement of the pole, a spring connected to the carrier and adapted to hold the carrier and pole in operative position, and means for operably connecting the pole to the carrier to exert the retractile force of the springs on the pole and check the falling movement of the latter when released from its carrier, substantially as specified.

6. The combination of a trolley-pole having at its lower end a cam adapted for operative contact with a fixed plate, a pivoted carrier to which said pole is fulcrumed, means for locking the pole to the carrier, and a secondary fulcrum or socket with which the pole is adapted to engage after a partial movement by its cam toward the locking position, substantially as specified.

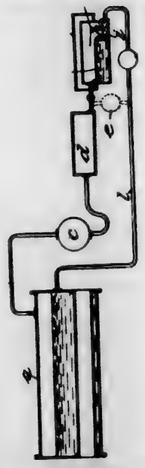
709,114. HANDWRITING-DEVELOPER. FREDERICK C. ROCKWELL, West Hartford, Conn. Filed Jan. 24, 1902. Serial No. 91,048. (No model.)

Claim.—1. A handwriting-developer which consists of a pad with a ball-bearing, and means for attaching the pad to the member of a person, substantially as specified.

2. A handwriting-developer consisting of a pad, recesses in the pad, freely-moving balls held in the recesses, and a flexible band for attaching the pad to a member, substantially as specified.

3. A handwriting-developer consisting of a pad, recesses in the pad, freely-moving balls held in the recesses, a flexible band for attaching the pad to a member, and means for adjusting the length of the band, substantially as specified.

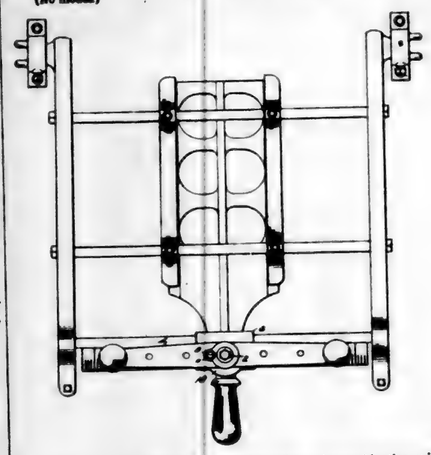
709,115. GENERATION OF MOTIVE POWER. SIGMUND A. ROSENTHAL, London, England. Filed Dec. 21, 1901. Serial No. 86,844. (No model.)



Claim.—1. A compound liquid for use in steam generation, consisting in combination, of water together with from .1 to .2 per cent. of a liquid of low boiling-point, high vapor tension, and low latent heat of vaporization, substantially as described.

2. A compound liquid for use in steam generation, consisting in combination, of water together with from .1 to .2 per cent. of acetone, substantially as described.

709,116. MACHINE FOR CUTTING PICTURE-MATS. CHARLES I. SHAWVER, Springfield, Ohio. Filed Jan. 16, 1902. Serial No. 89,964. (No model.)



Claim.—1. In a picture-mat-cutting machine, the combination, with a tool-holder traveling in a curved path, of a trailing tool mounted to rotate around an axis at right angles with the plane of said path, said tool having its forward engaging or contact edge in the rear of its axis of rotation, and means for limiting the outward motion of said tool, substantially as described.

2. In a picture-mat-cutting machine, the combination, with a tool-holder traveling in a circular or elliptical path, of a trailing tool having a shank mounted to rotate around a vertical axis in said holder, said tool having its forward engaging or contact edge in the rear of its axis of rotation, and means for limiting the outward movement of said tool to prevent its passing beyond the normal path thereof, substantially as described.

3. In a picture-mat-cutting machine, the combination, with a trailing cutting-tool having a vertical shank, the cutting edge of said tool being in the rear of the axis of the shank, of a tool-holder traveling in a circular or elliptical path, said shank being rotatably mounted in said tool-holder, and means for limiting the rotation of said shank so as to prevent the tool from moving outward beyond its normal path, substantially as described.

4. In a picture-mat-cutting machine, the combination with a trailing tool having a vertical shank provided with a vertical stop-shoulder, the cutting edge of said tool being in the rear of the axis of the shank, of a tool-holder having a collar in which said shank is rotatably mounted, and a projection to engage said stop-shoulder and thereby limit the outward motion of the cutter to prevent its moving outward beyond its normal path, substantially as described.

5. In a picture-mat-cutting machine, the combination, with a trailing bevel-cutter provided with a vertical shank, the cutting edge of said tool being in the rear of the axis of the shank, said shank having a recess provided with a lateral stop-shoulder, of a tool-holder comprising a collar in which said shank is rotatably mounted, and a set-screw adapted to enter the recess and engage the stop-shoulder, substantially as described.

6. In a picture-mat-cutting machine, the combination, with a trailing bevel-cutter provided with a vertical shank, the cutting edge of said tool being in the rear of the axis of the shank, said shank having a longitudinally-curved recess of less width than the shank, whereby a lateral stop-shoulder is formed, of a tool-holder comprising a collar in which said shank is rotatably mounted, and a set-screw threaded through said collar and having its end extending into said recess and adapted to engage the stop-shoulder when the shank is rotated in one direction, and the bottom of the recess when the shank is rotated in the opposite direction, whereby the rotation of the shank is limited in both directions, substantially as described.

709,117. TOY. JOHN B. SLOANE, Detroit, Mich., assignor of one-half to Willard B. Partridge, Detroit, Mich. Filed Nov. 26, 1900. Serial No. 37,767. (No model.)

Claim.—In a toy, the combination of a supporting-block, a wire inserted in an opening therein and extending upward a distance, bent at right angles and extended laterally substantially parallel with the board, a figure having pivoted legs and arms, pivotally suspended from the outer end of said wire the pivot being in vertical line with the center of the said figure, and a flexible board secured at one end to said block and adapted to vibrate to engage said figure, at the opposite end.

709,118. LADDER. CLAYTON B. SMITH, Forestville, Conn. Filed Oct. 2, 1901. Serial No. 77,226. (No model.)

Claim.—1. A ladder having in combination, side rails composed of sheet metal the edges of which are bent inward to form tubular cylindrical ribs, rungs and means for securing the same to the side rails, substantially as described.

2. A ladder having in combination, side rails the edges of which are bent inward to form tubular ribs, rungs fitting snugly between the beads of the respective side rails and means for rigidly securing them to said rails, substantially as described.

3. A ladder having in combination, metal side rails the edges of which are bent inward to form tubular cylindrical ribs, rungs fitting snugly between said ribs, means for securing the rungs to the rails and coupling-sockets at one end of the rails, substantially as described.

709,119. BLANK FOR PIPE-ELBOWS. HOWARD H. SMITH, Mount Vernon, Ohio, assignor to Richardson-Bowers Manufacturing Company, Forest, Ohio, a Copartnership. Filed Nov. 28, 1901. Serial No. 83,754. (No model.)

Claim.—1. As a new article of manufacture an intermediate blank for a pipe-elbow composed of sheet metal and having the opposite semi-cylindrical portions and the intermediate elevated portion and provided in the semicylindrical portions with the transverse initial crimps, substantially as set forth.

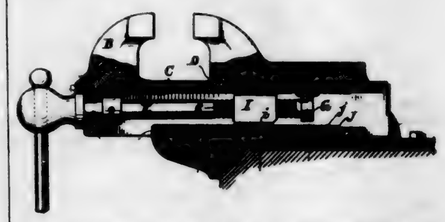
2. An intermediate blank for use in making pipe-elbows composed of sheet metal and consisting of the opposite semicylindrical portions having the transverse parallel crimps extending to their outer edges and having an elevated portion uniting their inner edges and projecting above the plane of the outer edges of the blank, whereby to provide for the lapping of said outer edges in the production of the complete cylinder for use in forming the elbow, substantially as set forth.

3. A blank for a pipe-elbow provided in its opposite edges with inwardly-tapering crimps, the crimps in the opposite edges of the blank being in alinement, substantially as set forth.

4. A blank for a pipe-elbow having a central longitudinal upwardly-projecting portion, and provided on opposite sides of said projecting portion with the curved portions bent on equal arcs and opening in the direction in which the central projection extends, substantially as set forth.

5. A blank for a pipe-elbow provided at its opposite edges with the parallel curved portions and provided in said curved portions with inwardly-tapering crimps, the crimps in one edge of the blank being in an alinement with crimps in the opposite edge, substantially as set forth.

709,120. VISE. WILLIAM R. SHERRER, Camden, N. J. Filed Jan. 21, 1902. Serial No. 90,615. (No model.)



Claim.—1. The combination in a vise of the fixed jaw and casing, a fixed rack, a movable jaw, a sliding portion on the same, a threaded shaft, a screw-nut to engage said rack, cams on said shaft adapted to raise and lower the inner end of said shaft substantially as described.

2. The combination in a vise of the fixed jaw and rack, a movable jaw, a threaded shaft, a screw-nut adapted to engage said rack, a cam on said shaft acting against the movable jaw to raise the inner end of said shaft, and a cam on the inner end of said shaft adapted to depress the inner end of said shaft substantially as described.

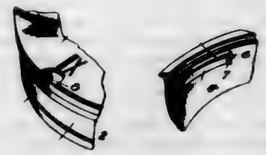
3. The combination in a vise of the fixed jaw and rack, a movable jaw, a threaded shaft, a screw-nut, cams on said shaft to bring the screw-nut into or out of engagement with the fixed rack.

4. The combination in a vise of the fixed jaw and rack, a movable jaw, a threaded shaft, a screw-nut, cams on said shaft to bring the screw-nut into or out of engagement with said rack, a set-screw on said movable jaw acting against the cam on the inner end of said shaft substantially as described.

5. The combination in a vise of the fixed jaw and rack, a movable jaw, a threaded shaft, a screw-nut, cams on said shaft to bring the screw-nut into or out of engagement with said rack, a leg on the movable jaw acting against the cam on the outer end of said shaft, substantially as described.

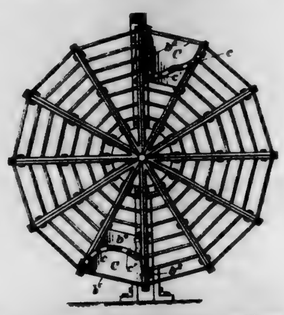
6. The combination in a vise of the fixed jaw and rack, a movable jaw, a threaded shaft, a screw-nut, cams on said shaft to bring the screw-nut into or out of engagement with said rack, a projection on said shaft to prevent said shaft from turning, substantially as described.

709,121. WATCH-MOVEMENT FASTENER. LEVI G. SELLENBERGER, Chambersburg, Pa. Filed May 28, 1902. Serial No. 108,243. (No model.)



Claim.—In combination with a case, a movement removably fitted within the case and having a depression in its front plate in the rear of the dial, a cut upon the edge of the said plate in communication and disposed approximately at a right angle to the depression, a spring-catch secured to the case at one end and provided at its free end with a right-angularly-disposed extension adapted to enter the aforementioned cut in the edge of the movement-plate, a bent extension also right-angularly disposed with relation to the aforesaid extension, the latter entering the depression in the plate and concealed by the dial covering the said depression, substantially as set forth.

709,122. **DEVICE FOR CLEANING CARPETS.** EARL C. STENTZ, Cleveland, Ohio. Filed Nov. 27, 1901. Serial No. 83,622. (No model.)



Claim.—1. A device for cleaning carpet, comprising a rotary drum having a transversely-located pocket upon its interior, such pocket consisting of a stationary and a suspended hinged diaphragm portion; and means for releasing such hinged portion at a predetermined point in the drum's rotation.

2. In a device for cleaning carpet, the combination with a rotary drum having a transversely-located pocket upon its interior, such pocket consisting of a stationary and a hinged portion, a latch secured to said drum engaging said hinged portion, and means secured to a stationary portion of the device for engaging said latch to disengage said hinged portion, whereby the latter is permitted to drop at a predetermined point in the drum's rotation.

3. In a device for cleaning carpet, the combination of a rotary drum having transversely-located pockets upon its interior, each such pocket consisting of a stationary and a hinged portion, each end of the latter provided with a pin projecting through the contiguous drum-wall, a latch hung upon the outside of each such wall and adapted to engage the contiguous pin and thereby hold such hinged portion suspended, and pins secured to a stationary part of the device adapted to engage each latch to release said hinged portion whereby the latter is permitted to drop at a predetermined point in the drum's rotation.

709,123. **SECURING ATTACHMENT FOR WAGON END-BOARDS.** WILLIAM L. STERLING, Brooklyn, Pa. Filed Apr. 16, 1902. Serial No. 103,063. (No model.)

Claim.—1. In a wagon-box, the combination with the side-boards and with the end-board of such box, of a clamping appliance which in its main portion consists of two arms which at the mid-length of the board are pivoted together, one directly upon the other, and which in its outer portions is pivoted upon such board; such outer portions being movable into or out of engagement with the side-boards, by the movement of the central or main portion of the appliance, directly across the face of the end-board; substantially as described.

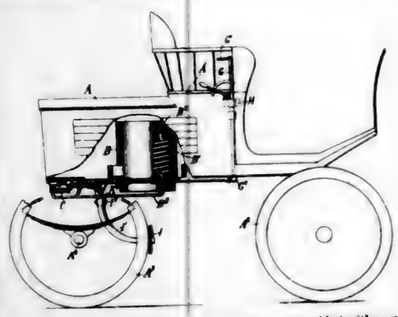
2. In a wagon-box, the combination with the side-boards, and with the end-board of such wagon-box, of an adjustable securing appliance which is operatively mounted upon the end-board; and a means, applied upon the end-board, for preventing outward movement of such securing appliance, while permitting its free upward and downward movement directly across the face of such end-board; substantially as shown and set forth.

3. In a wagon-box, the combination with the side-boards, and with the integral end-board of such box, of a clamping appliance which embraces two operating-arms which, at the mid-length of the end-board, are pivoted one upon the other, and which are movable either to clamp or to release the side-boards, by power applied directly to such arms themselves.

709,124. **BRAKE MECHANISM FOR MOTOR-VEHICLES.** JOHN UNDEN, Carthage, N. Y., assignor of one-half to William W. Hawes, Clayton, N. Y. Filed Mar. 3, 1901. Serial No. 50,289. (No model.)

Claim.—1. In a brake mechanism for motor-vehicles provided with a steam-boiler, a condenser-coil communicating with the boiler, brakes and a brake-operating piston actuated by fluid from said condenser-coil.

2. In a brake mechanism for motor-vehicles, a steam-boiler, a condenser-coil communicating with the steam-space of said boiler, a brake arranged to engage the wheel of said vehicle and a brake-operating piston arranged to be actuated by fluid from said condenser-coil.



3. In a brake mechanism for motor-vehicles provided with a steam-boiler, a condenser communicating with the steam-space of said boiler, a fluid-brake and means to actuate it by the fluid from said condenser.

4. In a brake mechanism for motor-vehicles having a steam-boiler, means to condense steam from said boiler, and thereby furnish a supply of water under pressure and a fluid-brake arranged to be actuated thereby.

5. In a brake mechanism for motor-vehicles, a supply of water under pressure, a fluid-pressure-actuating mechanism, a brake and a valve and connections therefor between said supply of water and said actuating mechanism, whereby a supply of water actuates the brake and is then discharged from the brake mechanism.

6. In a brake mechanism for motor-vehicles, a supply of liquid under pressure, a liquid-actuated brake, a brake-cylinder, a valve and connections therefor between said brake-cylinder and said supply of liquid to admit any desired amount of liquid to actuate the brake to any desired extent to hold said brake in operative position and to discharge said liquid from said brake mechanism.

7. In a brake mechanism for motor-vehicles, a supply of liquid under pressure, a liquid-actuated brake, brake-actuating means, a valve and connections therefor to admit liquid to said means and thereafter to discharge said liquid from said brake mechanism.

8. In a brake mechanism for a motor-vehicle, a supply of water under pressure, a brake, a brake-cylinder, a piston to operate said brake within said cylinder, a valve arranged to control the admission of said water to said cylinder and to allow its discharge from said brake mechanism.

9. In a brake-mechanism for motor-vehicles, a brake-cylinder, a spring-pressed piston therein, brake-shoes operatively connected to said piston, a supply of liquid under pressure and a three-way valve between said supply of liquid and said cylinder, whereby said liquid may be admitted to said cylinder to apply the brakes or the liquid discharged from said brake mechanism under the action of said spring.

10. In a brake mechanism for motor-vehicles, a friction-brake to engage a moving part of said vehicle, brake-actuating means, a supply of liquid under pressure, a valve and connections therefor to admit such fluid to said actuating mechanism and to discharge said fluid from the vehicle.

11. In a brake mechanism for motor-vehicles, a source of fluid under pressure, a fluid-brake, a valve to admit such fluid to said brake and means to fasten said valve in this position to prevent the disengagement of said brake.

12. In a brake mechanism for motor-vehicles, a source of fluid under pressure, a fluid-brake, a valve to control the admission of said fluid to said brake and a lock arranged to maintain said valve in position to admit said fluid to said brake.

13. In a brake mechanism for motor-vehicles, a brake, a fluid-pressure mechanism adapted to operate said brake and means to lock said mechanism in such position as to secure the continuous operation of said brake.

14. In a brake mechanism for motor-vehicles, a supply of fluid under pressure, fluid-pressure brake mechanism operatively connected therewith, a brake-rod adapted to control the admission of such fluid to said brake, a slidable locking-piece on said brake-rod and means to hold said locking-piece against rotation.

15. In a brake mechanism for motor-vehicles, a brake, a brake-actuating mechanism therefor, a brake-rod to control said brake-actuating mechanism, a slidable locking-piece on said brake-rod, an abutment adjacent said locking-piece and adapted to coact therewith to hold said locking-piece against rotation, a spring-lock on said abutment and arranged to hold said locking-piece in engagement with said abutment and means to disengage said spring-lock.

16. In a brake mechanism for motor-vehicles, a brake, a brake-actuating mechanism, a brake-rod arranged to control said brake-actuating mechanism, a stationery abutment adjacent said brake-rod, a sliding locking-piece on said brake-rod arranged to engage said abutment when said brake-rod is in position to operate said brake, a spring-latch adapted to hold said locking-piece in engagement with said abutment and a key to disengage said spring-latch from said locking-piece.

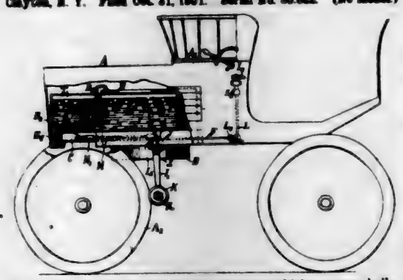
17. In a brake mechanism for motor-vehicles, a brake, a brake-arm suitably mounted and supporting said brake, a pin in said brake-arm, a coöperating stationary abutment, a spring and connections adapted to disengage said brake and bring said pin against said abutment so as to hold said connections rigid and prevent shaking.

18. In a brake mechanism for motor-vehicles, a pair of brake-arms pivotally mounted and carrying brakes thereon, means coacting with said brake-arms to prevent shaking when the brakes are released, an equalizer-bar loosely connected with said brake-arms, a brake-cylinder, a spring-pressed brake-piston within said cylinder connected to said equalizer with a pivotal connection and means to operate said piston by liquid-pressure.

19. In a brake mechanism for motor-vehicles, a pair of pivotally-mounted brake-arms, brake-shoes rigidly fastened thereon, an equalizer-bar loosely connected to said arms, a brake-cylinder, a spring-pressed piston therein, a piston-rod pivotally attached to said equalizer-bar, abutments adjacent said brake-arms and pins on said brake-arms, a supply of liquid under pressure to actuate said brake, a three-way valve arranged between said source of liquid-supply and said brake-cylinder and a locking device adapted to lock said valve in such position as to actuate said brakes.

20. In a brake mechanism for motor-vehicles, a friction-brake to engage a moving part of said vehicle, a brake-cylinder to actuate said brake, a supply of fluid under pressure, a valve and connections therefor to admit said fluid to said cylinder to actuate the brake, to maintain the brake in operative position and to discharge said fluid in said cylinder from the vehicle to release the brake.

709,125. **BRAKE MECHANISM FOR MOTOR-VEHICLES.** JOHN UNDEN, Carthage, N. Y., assignor of one-half to William W. Hawes, Clayton, N. Y. Filed Oct. 31, 1901. Serial No. 80,622. (No model.)



Claim.—1. In a brake mechanism for motor-vehicles, a steam-boiler, a water-tank, a condenser-worm in said water-tank connected with the steam-space of said boiler, a storage-chamber formed at the lower end of said worm, a brake-cylinder mounted on the frame of said vehicle, a valve-casing formed on said cylinder and communicating with the interior of the same, with said storage-chamber and with said water-tank, a spring-actuated piston in said cylinder, an equalizer loosely connected with said piston, brake-arms connected to said equalizer by brake-links, brake-shoes secured to the outer end of said brake-arms, brake-wheels mounted between said brake-shoes to engage the wheels of the vehicle, a spring-pressed three-way valve in said valve-casing, a brake-handle connected to said valve to admit condensed steam from said storage-chamber into said cylinder to actuate the brake and to discharge the water from said cylinder into said tank and a locking-piece secured to said brake-handle to maintain said brake in operative position.

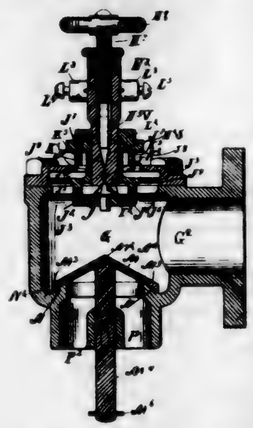
2. In a brake mechanism for motor-vehicles, a brake-cylinder, a piston in said cylinder, brakes actuated from said piston, a valve-casing secured to said cylinder, a boiler, a water-tank adjacent said boiler, a condenser-worm in said water-tank communicating with the steam-space in said boiler and connected to said valve-casing, said valve-casing being connected to said water-tank and communicating with said cylinder, a valve in said casing to admit water from said worm into said cylinder and to discharge such water from said cylinder into said tank.

3. In a brake mechanism for motor-vehicles, a liquid-operated brake, a boiler, a water-tank, a condenser-worm communicating with the steam-space in said boiler, a valve and connections therefor to actuate said brake by water from said condenser-worm and to discharge such water into said water-tank.

4. In a brake mechanism for motor-vehicles, a fluid-actuated brake, a boiler, a water-tank, a condenser-worm located in said water-tank and communicating with the steam-space in said boiler, a storage-chamber at the lower end of said worm, a valve and connections therefor to admit water from said storage-chamber to said brake and to discharge such water into said water-tank.

5. In a brake mechanism for motor-vehicles, a brake-cylinder, a spring-pressed piston therein to actuate a brake, a valve-casing formed on said cylinder, a tapered three-way valve in said valve-casing, a spring to press said valve against its seat in said casing, a tap screwed upon said casing to hold said spring in position, said casing being formed with a cylinder-port communicating with said cylinder, an inlet-port communicating with a source of fluid under pressure and a discharge-pipe, a brake-handle and connections between said brake-handle and said valve to admit fluid to said cylinder to discharge such fluid through said discharge-pipe and to hold such fluid in said cylinder and a locking-piece connected to said handle to lock said valve in position to admit fluid to said cylinder.

709,126. **VAPORIZING DEVICE FOR EXPLOSIVE-ENGINES.** BENJAMIN C. VANDUSEN, Winton Place, Ohio. Filed July 12, 1898. Serial No. 686,858. (No model.)



Claim.—1. The combination of the mixing-chamber G, piston in chamber or guideway J^1, stop below the piston, valve J, gasolene-inlet conduit H^2 constricted at I, and conical valve H^3 for regulating the passage of gasolene through the conduit H^2, and having a conical seat in the said conduit-pipe, springs L, having one branch connected to the piston and one branch to a fixed point as L^3, substantially as and for the purpose specified.

2. The combination of the mixing-chamber G, piston in chamber or guideway J^1, stop below the piston, valve J, gasolene-conduit H^2 constricted at I, and valve H^3 for regulating the passage of gasolene through the conduit H^2, and springs L, having one branch connected to and slidable through the extension L^2 of the piston, and the other branch connected to a stationary stud L^3, and having an opening through which the other branch L^4 of the spring is slidable, and set-screw for setting the adjustment of the spring, substantially as and for the purposes specified.

3. The combination of the mixing-chamber, gasolene-inlet conduit, dropable valve for controlling admission of gasolene therefrom to the mixing-chamber, sleeve connected to the piston and embracing the inlet-conduit, spring connected to the sleeve and to a fixed dotent, the dropable valve supported by the piston, substantially as and for the purpose specified.

4. The combination of the mixing-chamber, inlet gasolene-conduit, movable piston, carrying valve, controlling the admission of gasolene through the conduit, abutment, wedge resting thereon, and abutments or lugs connected to the piston for engagement with the wedge, and the governer, and means for enabling the governor to reciprocate the wedge and control the drop of the piston, and elastic means for holding up the piston and valve, except when the suction in the mixing-chamber opens it, substantially as and for the purpose specified.

5. The combination of the mixing-chamber and the air-inlet valve M, located directly below the gasolene-inlet valve, this air-valve M being conical above, the under side of its peripheral edge being inclined outward and downward and overlapping the edge of the air-inlet conduit, this latter edge being inclined outward and downward and terminating in the annular channel for the collection and aeration of gasolene, substantially as and for the purposes specified.

6. The combination of the mixing-chamber and the air-inlet valve conical above, and having its under outer edge inclined outward and downward, and the air-inlet conduit P having its upper end inclined outward and downward forming a tight seat for the valve M, when closed, and having an annular channel below and adjacent to the peripheral edge of the valve M, and an inlet gasolene conical valve, and a dropable valve supported by the piston, and in vertical line above the central portion of the air-inlet valve, substantially as and for the purposes specified.

709,127. FIRE-ESCAPE. MICHAEL WAGNER, Trenton, N. J. Filed Jan. 3, 1902. Serial No. 88,276. (No model.)

Claim.—1. In a fire-escape the combination of a loosely-mounted drum or pulley, a loosely-mounted member spaced from the drum, brake-shoes adapted to engage the opposing faces of the drum and member, a wedge working between the brake-shoes, and a governor connected with and operating said wedge, as set forth.

2. In a fire-escape, the combination of spaced gear-wheels, a drum or pulley carried by one gear-wheel, a pinion meshing with the gear-wheels, brake-shoes for engaging the opposing faces of the gear-wheels, a wedge working between the brake-shoes, and a governor having its stem connected with the wedge, as set forth.

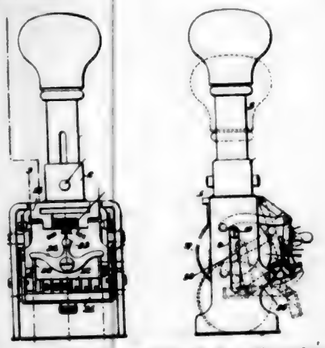
3. In a fire-escape, the combination of spaced gear-wheels, a drum or pulley carried by one of the gear-wheels, a pinion having a hollow hub and meshing with the gear-wheels, brake-shoes having inclined inner faces and arranged between the gear-wheels, said brake-shoes being adapted to engage the inner faces of the gear-wheels, a wedge working between the brake-shoes, and a governor having its stem extending through the pinion and connected with the wedge, as set forth.

4. In a fire-escape, the combination with an endless rope or chain adapted to sustain persons while making a descent, and a carrying-pulley therefor, of a loosely-mounted gear facing the carrying-pulley, a pinion driven from the carrying-pulley and in driving connection with the gear, supports for the carrying-pulley, the pinion and the gear, a ball-governor in operative connection with the pinion, the shaft of the governor sliding loosely in said pinion, opposing brake-shoes adapted for sliding movement relative to each other and having straight outer faces arranged for contact with the inner faces of the carrying-pulley and gear, and inclined inner or opposing faces, and a wedge-block carried by the governor-shaft, operating when forced downward to carry the brake-shoes in frictional contact with the carrying-pulley and gear, as and for the purpose described.

5. In a fire-escape, the combination with an arched bracket, a shaft mounted in the bracket, a drum or pulley loosely mounted on the shaft, and provided with a gear-wheel on its inner face, a loosely-mounted gear-wheel on the shaft and spaced from the gear-wheel of the drum or pulley, brake-shoes mounted on the shaft between the gear-wheels and having inclined inner faces, the brake-shoes having overlapping upper ends, a wedge straddling the shaft, a pinion mounted in the bracket and meshing with the said gear-wheels, and a ball-governor having its stem extending through the pinion, the overlapping ends of the brake-shoes, and connected with the wedge, as set forth.

709,128. NUMBERING-MACHINE. ALBERT P. WATERMAN, Orange, and GEORGE H. B. BRENNOLD, Newark, N. J., assignors to the Edison Phonograph Works, Orange, N. J., a Corporation of New Jersey. Filed Aug. 2, 1900. Serial No. 25,603. (No model.)

Claim.—1. In a numbering-machine, the combination with a series of number-carrying disks or wheels, of a pawl-carrying plate arranged exteriorly of said disks or wheels, pawls on said plate engaging said disks or wheels for operating the latter, a finger or pawl carried by said plate arranged to prevent consecutive operation of the feed-pawls, an alternate deep-toothed disk arranged concentrically to the number-carrying wheels or disks and with which said finger coöperates, a lever pivoted to the pawl-carrying plate for engaging said finger with, and permitting disengagement of said finger from, the alternate deep-toothed disk, and a second finger pivoted to the pawl-carrying plate and with which said lever coöperates for throwing the feed-pawls continuously out of operation, substantially as set forth.



2. In a numbering-machine, the combination with a series of number-carrying disks or wheels, of a pawl-carrying plate arranged exteriorly of said disks or wheels, pawls on said plate engaging said disks or wheels for operating the latter, a finger or pawl carried by said plate arranged to prevent consecutive operation of the feed-pawls, an alternate deep-toothed disk arranged concentrically to the number-carrying wheels or disks and with which said finger coöperates, a lever pivoted to the pawl-carrying plate for engaging said finger with, and permitting disengagement of said finger from, the alternate deep-toothed disk, a second finger pivoted to the pawl-carrying plate and with which said lever coöperates for throwing the feed-pawls continuously out of operation, and a plain disk with which the second finger coöperates, substantially as set forth.

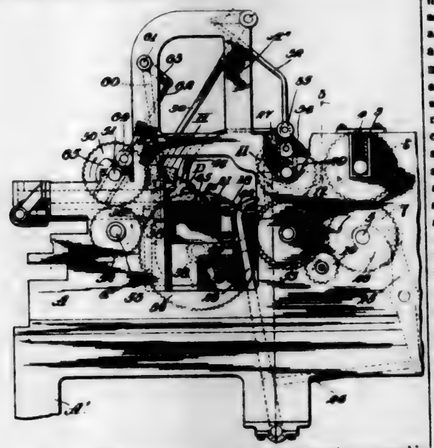
3. In a numbering-machine, the combination with a series of number-carrying disks or wheels, of a pawl-carrying plate arranged exteriorly of said disks or wheels, pawls on said plate engaging said disks or wheels for operating the latter, a finger or pawl carried by said plate arranged to prevent consecutive operation of the feed-pawls, an alternate deep-toothed disk arranged concentrically to the number-carrying wheels or disks and with which said finger coöperates, a lever pivoted to the pawl-carrying plate for engaging said finger with, and permitting disengagement of said finger from, the alternate deep-toothed disk, a second finger pivoted to the pawl-carrying plate and with which said lever coöperates for throwing the feed-pawls continuously out of operation, and a stationary plain disk with which the second finger coöperates, substantially as set forth.

709,129. PAPER-BAG MACHINE. HERBERT R. WHITEVELL, South Bend, Ind. Filed June 12, 1900. Serial No. 20,041. (No model.)

Claim.—1. The combination with a folding-bed; of a defining-plate consisting of two separated and relatively immovable portions; means for turning or folding back one of the plies of the blank; and a device for holding the other ply during the operation of said ply-folding means, the said holding device being located so that the opposite portions of the defining-plate will pass on its opposite sides.

2. The combination with the folding-bed; of a defining-plate combined with means for automatically advancing the same over the folding-bed; devices for entering the blank-tucks and folding back one of the plies thereof; a device for holding the other ply of the blank, the said defining-plate and holding device being constructed and arranged to permit the latter to pass the former without interfering therewith; and means for supporting said holding device so that the advance of the defining-plate causes a relative movement of the same toward and past the holding device, substantially as described.

3. The combination with the folding-bed; of a defining-plate consisting of two fixed portions, separated so as to form a space between their inner ends; a frame supporting the portions of the defining-plate and extended across the machine below the folding-bed; means for advancing the defining-plate along the folding-bed; means for folding back the upper ply of the bag-blank; and a device for holding the lower ply thereof, said device being located in line with the space between the inner ends of the defining-plate.



4. A defining-plate consisting of two separated portions, in combination with two uprights, to which said portions are secured at their outer ends; and a tie-rod connecting the other ends of said uprights.

5. The combination with the defining-plate consisting of two fixed portions separated at their inner ends; a frame carrying said defining-plate, and consisting of uprights secured to the outer ends of the portions of the plate; and a cross-rod extending between the lower ends of the uprights; swinging ways along which said uprights can travel; and means for advancing the same along said ways.

6. The combination with the folding-bed; of a defining-plate consisting of two fixed portions separated at their inner ends; means for advancing the defining-plate along the folding-bed; means for forming the bag-blank into a diamond fold during its advancement along the folding-bed; and holding devices acting upon the central portion of the blank during the formation of the diamond fold.

7. The combination with the folding-bed; of a defining-plate arranged to travel along the same, said plate consisting of two fixed portions separated at their inner ends; and one or more sets of rollers arranged in position to act upon the bag-blank, and in line with the space between the inner ends of the defining-plate.

8. The combination with the folding-bed and with tuck-entering and ply-folding devices combined with mechanism for advancing such devices along the folding-bed; of rollers for acting upon the bag-blanks; means for supporting said rollers above and below the path of travel of the blank over the folding-bed, between the paths of travel of the tuck-entering and ply-folding devices, substantially as described.

9. The combination with the folding-bed; of an arm secured to the forward portion of the machine, and extending rearwardly toward and over the folding-bed; a nose at the rear end of the said arm; and one or more sets of rolls, one in each set being arranged above and the other below the path of travel of the blank over the folding-bed, the upper rolls being journaled in said arm and the lower ones in a support below the folding-bed.

10. The combination with the folding-bed; of a defining-plate consisting of two fixed portions separated at their inner ends; means for advancing the defining-plate along the folding-bed; means for turning back the upper ply of the blank to form the diamond fold; one or more sets of rolls secured in position, the upper one above and the lower one below the path of travel of the blank, said rolls being arranged between the paths of travel of the two portions of the defining-plate; and means for driving said rolls.

11. The combination with a frame arranged for travel forward and backward in the machine; a cross-rod carried by said frame; and devices for entering the blank-tucks and folding the plies of the blank into the diamond fold, said devices being carried by an arrangement to travel upon the cross-rod of said frame.

12. The combination with the defining-plate; of a frame carrying the same, and embodying in its construction the cross-rod; standards mounted upon said cross-rod and arranged to slide along the same; and butterflys carried by said standards.

13. The combination with the folding-bed; of a movable frame carrying the presser-plate consisting of two fixed portions separated at their inner ends; the said frame being constructed with a cross-rod forming the lower transverse member of the frame; longitudinally-arranged ways for carrying said frame, said ways being pivoted at their forward ends so as to permit them to swing vertically; means for advancing the frame along the ways and retracting the same; means for holding the ways in an elevated position, and for lowering the same during the initial movement of the frame along the ways; standards carrying butterflys adapted to enter the blank-tucks and fold backward the upper ply of the blank; said standards being arranged for transverse movement relatively to the machine, upon the cross-rod forming a part of the said movable frame; same constructed with inwardly-inclined surfaces for moving the standards inwardly as the frame carrying them advances, and also with straight surfaces for maintaining them in their inward position; and abutments secured to the swinging ways and adapted to engage the butterflys and swing the same as they are advanced by the advancement of the frame along the ways.

14. The combination with the swinging ways; of the upright arms 27 secured to the rear ends thereof; means for coöperating the said arms to elevate the rear ends of the ways; and arms 44 secured to the upper ends of the arms 27, and provided with noses or abutments 45 adapted to engage the butterflys.

15. The combination with the folding-bed; of longitudinally-swinging ways arranged for vertical swinging movement; means for swinging said ways vertically up and down; a frame movable along said ways and carrying a presser-plate, said frame being constructed with a transverse cross-rod having its outer end portions inclined upwardly from its ends; standards arranged to move upon said cross-bar, and provided with tuck-entering and ply-folding devices; and means for actuating said standards so as to cause their inward and outward movement.

16. The combination with the folding-bed, and means for lifting the end of the upper ply of the blank and swinging the same upwardly and downwardly in a single continuous movement over the body portion of the blank so as to form the diamond fold; of wings or flaps adapted to strike against the sides of the blank and bend or press the same inwardly; and mechanism for swinging such wings or flaps so as to cause them to brush or strike against the sides of the blank.

17. The combination with the folding-bed, and means for forming the diamond fold thereupon; of leaves or flaps H having interned portions; swinging arms carrying said leaves or flaps; a rock-shaft carrying said arms; a link pivotally connected with a rocker-arm on said rock-shaft; and a cam for reciprocating said link.

18. The combination with the folding-bed and with means for forming the diamond fold thereupon, of a pair of wings or flaps adapted to strike against the sides of the blank and bend or press the same inwardly, and means for swinging such wings or flaps in a direction longitudinally of the folding-bed, substantially as set forth.

19. The combination with the folding-bed and with means for forming the diamond fold thereupon, of a pair of wings or flaps adapted to strike against the sides of the blank and bend or press the same inwardly, mechanism for swinging such wings or flaps in a direction longitudinally of the folding-bed so as to strike the sides of the blank and means for moving the bag-blank in a direction opposite the direction of movement of the swinging wings or flaps at a time when such wings or flaps strike against the sides of the bag-blank, substantially as described.

20. In a bag-machine, means for slightly turning in the sides of the bag-blank when such sides are in a standing position during the formation of the diamond fold, said means comprising a pair of longitudinally-extending and inwardly-inclined blades arranged on opposite sides of the bag-blank, and means for producing a relative longitudinal movement between the blades and the blank in such a direction that the ends of the blades separated most widely from one another meet the blank first, whereby the further longitudinal movement after such meeting causes the converging portions of the blades to rub against the blank sides throughout their length, and thereby turn or bevel the same in, substantially as described.

21. The combination with means for separating the plies of the bag-blank and swinging them continuously away from one another so as to form the diamond fold in a single operation, of means for turning the side edges of the blank slightly in when the same are in a standing position, and before the beginning of the folding operation, whereby the edges are directed inwardly and tearing of the same is prevented as the swinging movement of the plies is continued to form the diamond fold, substantially as described.

22. The combination with means for defining the primary creases of the bag-bottom, of means for engaging the lower ply of the bag-blank, means for engaging the upper ply and swinging it continuously upwardly, backwardly and downwardly so as to form the diamond fold in a single operation, edge-turners adapted to turn the side edges of the blank slightly in, and means for operating said edge-turners so as to cause them to act upon the side edges of the blank when the same are in a standing condi-

tion, and to separate from the same before the beginning of the folding operation, substantially as and for the purpose set forth.

23. The combination with the folding-bed, of a pusher-plate for holding the bag-blank upon the folding-bed and defining the primary crease, means for holding the lower ply of the blank to the folding-bed, a device for engaging the upper ply of the blank, means for actuating such device so as to cause the upper ply of the blank to be separated from the lower ply and swung upwardly and backwardly and then downwardly upon the body portion of the blank in a single continuous operation, edge-turners adapted to turn the side edges of the blank slightly in, and means for actuating said edge-turners so as to cause them to act upon the side edges when the same are in a standing condition, and to withdraw therefrom before the beginning of the folding operation, substantially as and for the purpose set forth.

24. The combination of devices for engaging the lower ply of the bag-blank, devices for engaging the upper ply of the blank and folding the same backwardly, and edge-turners adapted to act upon the edges of the bag-blank when the same are in a standing position.

25. The combination of grippers for engaging the lower ply of the bag-blank, devices for engaging the upper ply and folding the same backwardly, a creasing-blade adapted to form the transverse crease for the primary fold, and edge-turners adapted and arranged to act upon the edges of the bag-blank when the same are in a standing position.

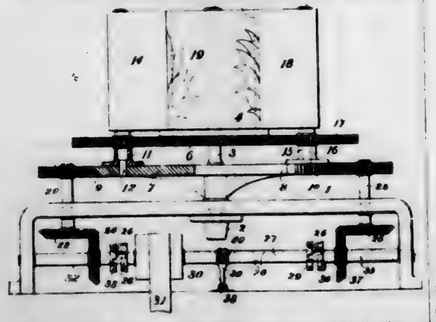
26. The combination with side grippers adapted to clasp both plies of the bag-blank to the folding-bed, of edge-turning devices adapted and arranged to act upon the edges of the bag-blank when the same are in a standing position.

27. The combination of a front gripper, devices for gripping the lower ply of the bag-blank, devices for engaging the upper ply thereof and folding the same backwardly, a creasing-blade adapted to form the crease for the primary fold, side grippers adapted to engage both plies of the bag-blank and hold the same against the folding-bed, and edge-turning devices adapted and arranged to act upon the edges of the bag-blank when the upper ply is bent or folded backwardly by the ply-folding devices to an extent to place the edges of the blank in a standing condition.

709,180. PENHOLDER. KARL H. ZENK, Marion, Ind. Filed Jan. 29, 1902. Serial No. 91,798. (No model.)

Claim.—A penholder comprising a handle having one end hollow, the hollow end portion of the handle having a longitudinally-extending recess opening through the end of the holder, and having a slot formed through the bottom of the recess and having its rear end directed laterally, a sleeve slidably and rotatably mounted upon the hollow end portion of the handle and covering the recess, a pin engaged with the sleeve and passed through the slot and movable therethrough as the sleeve is moved longitudinally and rotated, said sleeve having also longitudinal cuts formed through the bottom of the recess in the planes of the side walls of the latter and entering the hollow of the handle.

709,181. APPARATUS FOR MOLDING THE EXTERIOR OF ARTICLES IN CLAY OR OTHER PLASTIC MATERIAL. MOSES J. ADAMS, Leeds, England. Filed Dec. 3, 1901. Serial No. 84,540. (No model.)



Claim.—1. In apparatus for molding decorated articles in clay or other plastic material, the combination of a core for carrying the clay to be molded with a molding-body adapted to travel around said core, and means independent of the engagement of the molding-body with the clay for causing the molding-body to rotate on its own axis, whereby clay laid on said core is molded with a design by the said molding-body without appreciable slip, substantially as set forth.

2. In apparatus for molding decorated articles in clay or other plastic material, the combination of a core for carrying the clay to be molded, a plurality of molding-bodies each adapted to travel around said core and each adapted to mold a portion of the external shape of the article to be molded, and means independent of the engagement of said molding-bodies with the clay for causing the molding-bodies to rotate on their own axes, whereby clay laid on said core is molded on its external surface with a design by the said molding-bodies without appreciable slip, substantially as set forth.

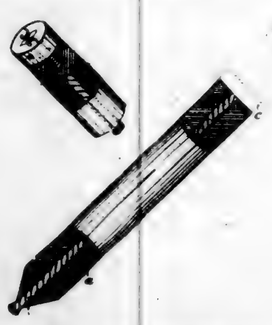
3. In apparatus for molding decorated articles in clay or other plastic material, the combination of a core to receive the clay to be molded, a molding-body adapted to act upon the clay on said core, means for causing said molding-body to travel around said core, and positive engaging means connecting said molding-body with said core for causing said molding-body to rotate on its own axis while traveling around said core, whereby the clay on said core is molded by the said molding-body and a design formed on said molding-body is formed in said clay without appreciable slip, substantially as set forth.

4. In apparatus for molding decorated articles in clay or other plastic material, the combination of a core to receive the clay to be molded, a plurality of molding-bodies each adapted to act upon the clay on said core, means for causing said molding-bodies to travel around said core, and positive engaging means connecting said molding-body with said core for causing said molding-bodies to rotate each on its own axis while traveling around said core, whereby the clay on said core is molded by the said molding-bodies and designs formed on said molding-bodies are formed in said clay without appreciable slip, substantially as set forth.

5. In apparatus for molding articles in clay or other plastic material, the combination of a core for carrying the clay to be molded, a support for said core, a toothed wheel carried by said support, a molding-body for acting on the clay on the said core, a second support mounted to rotate about said core-support and carrying said molding-body, and a pinion for said molding-body carried by said second support and engaging with said toothed wheel, and means for rotating said second support, whereby when the latter is rotated the said molding-body will rotate on its own axis while traveling around the said core, substantially as set forth.

6. In apparatus for molding articles in clay or other plastic material, the combination of a core for carrying the clay to be molded, a support for said core, a toothed wheel carried by said support, a plurality of molding-bodies for acting on the clay on the said core, a second support mounted to rotate about said core-support and carrying said molding-bodies, and a pinion for each molding-body carried by said second support and engaging with said toothed wheel, and means for rotating said second support, whereby when the latter is rotated the said molding-bodies will rotate each on its own axis while traveling around the said core, substantially as set forth.

709,182. PREPARED SEALING-WAX. THOMAS ARDIRON, Brooklyn, N. Y., assignor to John Murphy, Brooklyn, N. Y. Filed Jan. 8, 1902. Serial No. 88,873. (No model.)



Claim.—1. As an article of manufacture, a stick of sealing-wax having a wick forming a longitudinal core therein, said wick being disposed eccentrically in the stick, substantially as described.

2. As an article of manufacture, in combination, a stick of sealing-wax having a wick forming a longitudinal core therein, and a handle secured to one end of said stick, the adjacent faces of the stick and handle having engaging projections and recesses, substantially as described.

709,183. INK-WELL. STEPHEN G. BALDWIN, Marion, Ind. Filed Sept. 16, 1901. Serial No. 75,561. (No model.)

Claim.—1. In an ink-well, the combination of a body portion, a large and a small compartment in the interior thereof, said small compartment extending from the wall of the interior of the well, to a point beyond the center of said well a top having a pen-opening considerably below the outer edges thereof, the edges of said pen-opening being below the top of the walls forming said smaller compartment, and means adapted to cover said pen-opening by the force of gravity, substantially as described.

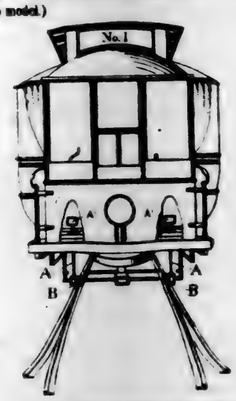
2. In an ink-well, the combination of a body portion, a large and small compartment in the interior thereof, said small compartment extending from the wall of the interior of the well to a point beyond the center of said well, and a top having a pen-opening considerably below the outer edges thereof, the edges of said pen-opening being below the top of the walls forming said smaller compartment, substantially as described.

3. In an ink-well, the combination of a body portion, a small compartment formed therein and extending from the side thereof to a point beyond the center thereof, whereby said compartment may be filled by tilting the well, and a top having a pen-opening lower than the top of said compartment, thereby causing the interior of the well to be perfectly air-tight when said small compartment is filled, substantially as described.

4. In an ink-well, the combination of a body portion a large and a small compartment formed therein and integral therewith, a top having a pen-opening therein slightly lower than the top of said small compartment and integral therewith, and a cover for said opening, substantially as described.

5. In an ink-well, the combination of a body portion a small compartment formed therein and extending from the side thereof, to a point beyond the center thereof, whereby said compartment may be filled by tilting the well, a top having a pen-opening lower than the top of said compartment thereby causing the interior of the well to be perfectly air-tight when small compartment is filled and means adapted to cover said pen-opening by the force of gravity, substantially as described.

709,184. SWITCH-THROWING DEVICE. URIAH F. BENSELL, Dayton, Ohio. Filed Oct. 22, 1900. Renewed Feb. 13, 1902. Serial No. 93,946. (No model.)



Claim.—1. A switch-throwing device, comprising a beveled wheel provided with conical bearings rotating upon an axle between two coiled springs suspended within the hanging frame which is attached to the rod extending upward through the platform or bottom of the car.

2. A switch-throwing device, comprising a beveled wheel provided with conical bearings adapted to rotate upon the axle or rod which passes through the bearings and through the beveled wheel, having provided on each side of the wheel a coiled spring, designed to keep the beveled wheel in the desired position yet permitting of slight side movement, and also having provided the guiding part which is secured into the upper part of the hanging frame, the hanging frame secured to some suitable adjustable contrivance by means of which it is operated and attached to the car.

3. In a switch-throwing device of the class described, consisting of a beveled wheel having a conical indentation on each side, the conical bearings designed to fit into the conical indentations, the axle or rod upon which they rotate passed through the conical bearings and through the beveled wheel, the coiled springs, one of which is placed on each side of the wheel, the hanging frame into the lower ends of which is secured the axle, the rod or support to which is secured the hanging frame, which extends up through a suitable supporting arm or device thence through the platform or bottom of the car through a plate which is secured to the platform of the car, the upper portion of the rod being square and provided with a loop, and the coiled spring which operates around the rod between the plate and the loop designed to hold the device up so as to pass obstructions, substantially as specified.

4. In a switch-throwing device of the class described, consisting of a beveled wheel, the beveled sides of which constitute oppositely-inclined surfaces: the wheel provided with conical indentations on the central sides, the conical bearings designed to fit into these conical indentations the axle or rod which is passed through the conical bearings and through the beveled wheel upon which they rotate, the coiled springs placed upon each side and operating against the conical bearings keeping them forced into the conical indentations provided in the beveled wheel, the hanging frame having provided and secured into the lower ends the axle, the hanging frame being secured to a bar or rod which extends upward through an aperture in a suitable support or stay, thence through the platform or bottom of the car, the plate which is provided with a square aperture through which the rod or bar is passed, the upper part of the rod being square and of larger diameter than the lower part, the loop provided at the upper end of the bar, and the coiled spring which is placed around the bar and designed to operate between the plate and the loop, substantially as specified.

5. In a switch-throwing device of the class described, consisting of a beveled wheel, the beveled sides of which constitute oppositely-inclined surfaces, the central sides of the wheel being conically indented, the conical bearings designed to fit into the said conical indentations, the axle or rod upon which the wheel and the conical bearings rotate, the said rod being passed through the said conical bearings and through the beveled wheel, the coiled springs which are designed to encircle the axle, one on each side of the wheel, and to operate against the conical bearings which keeps them forced into the conical indentations provided in the beveled wheel, the guiding arrangement which is secured into the upper part of the hanging frame, the lower part of the guiding arrangement being beveled, having oppositely-inclined walls designed to fit over the beveled edge of the wheel, the hanging frame, into the lower ends of which is secured the axle, the operating bar or rod which is secured into the hanging frame at a suitable distance from the center of said frame or line of the wheel designed to produce a different point of contact which the wheel will have upon the rail by swinging the device half-way around: the lower portion of the said rod or bar being round and of smaller diameter than the square aperture in the plate, designed to be secured to the bottom of the car, through which the bar or rod passes, thus permitting the turning of the device when raised so that the round portion of the rod or bar comes into the said aperture, the support or stay arm, secured to the bottom of the car-platform provided with an aperture through which the operating bar or rod passes, the plate, which is provided with a square aperture, secured to the platform of the car through which the rod or operating-bar passes, the upper portion of said bar being square, fitting into the square aperture in said plate designed to hold the device rigidly when not to be reversed, the upper end of the rod or operating-bar provided with a cross or loop and the coiled spring placed around the operating bar or rod and designed to operate between the plate and the loop, substantially as specified.

6. In a switch-throwing device of the class described, the combination of a beveled wheel, the beveled parts of which form oppositely-inclined surfaces, the central sides of the wheel provided with conical indentations, the conical bearings designed to fit into these conical indentations, the axle or rod passed through the conical bearings and through the beveled wheel upon which they rotate, the coiled springs designed to keep the conical bearings pressed rigidly into the conical indentations, with the supporting-frame designed to support the same to the car and by means of which it is operated from the car, substantially as specified.

7. In a switch-throwing device of the class described, the combination of the device consisting of a beveled wheel, the beveled parts of which form oppositely-inclined surfaces, the wheel provided with central conical indentations on the sides, the conical bearings designed to fit into these conical indentations, the axle or rod upon which the wheel and the conical bearings rotate, the coiled springs designed to be placed around the axle upon each side of the wheel and to operate against the conical

bearings thus keeping them pressed into the conical indentations, the hanging frame into which the beveled wheel is suspended provided with the guiding arrangement designed to keep the wheel in the middle and at equal distances from the sides of the hanger, the hanger attached to an operating bar or rod at one side of the hanging frame, designed to give a different point of contact by swinging the device half-way around provisions for which are made, the rod or operating-bar passed through a suitable supporting arm or contrivance, thence through a plate which is designed to be secured on the top of the platform of the car and provided with a coiled spring designed to operate between said plate and some suitable eye or loop provided at the upper end of the operating-rod, with the guiding-plate designed to be secured to the rail, substantially as specified.

8. In a switch-throwing device of the class described, consisting of the wheel B which is beveled to a slightly-rounded edge, the beveled sides constituting oppositely-inclined surfaces, the central sides of the wheel B being conically indented, the conical bearings B' and B^2 designed to fit into the said conical indentations, the axle or rod A^6 upon which the wheel and the conical bearings rotate, the said axle A^6 being passed through the said conical bearings B' and B^2 and through the beveled wheel B, the coiled springs A^7 and A^8 designed to encircle the axle A^6 and to operate against the conical bearings B' and B^2 one on each side which keeps the bearings forced into the conical indentations provided in the beveled wheel B, the guiding device B^3 secured in the upper part of the hanging frame A^4, the said guiding device being beveled at the lower end forming oppositely-inclined walls designed to fit over the beveled edge of the wheel, the hanging frame A^4 into the lower ends of which is secured the axle A^6, the operating rod or bar A to which is secured the hanging frame by means of the nut A^5, the hanging frame secured to the said operating device at a suitable distance from the middle of said frame designed to produce a different point of contact that the edge of the wheel B will have upon the switch by the operation of swinging the device half-way around; the lower portion of the said rod or bar being round, the supporting arm or device A^3 which is provided with a circular aperture through which the lower end of the operating rod or bar is passed, the plate A^2 designed to be attached to the upper side of the car-platform which is provided with a square aperture into which the upper end of the operating rod or bar A is inserted, the said rod or bar being square and of a size designed to fit loosely into said aperture in said plate, the loop A' provided at the upper end of the operating rod or bar, the coiled spring A^9 designed to encircle the rod or bar and to operate between the plate A^2 and the said loop A', substantially as specified.

9. In a switch-throwing device of the class described, the combination of the device consisting of the beveled wheel B provided with central conical indentations on the sides, the conical bearings B' and B^2 designed to fit into said conical indentations, the axle A^6 upon which the wheel and the conical bearings rotate, the coiled springs A^7 and A^8 encircling the said axle A^6 and operating against the conical bearings B' and B^2, the hanging frame A^4 into which the axle A^6 is secured, the guiding device B^3, the supporting-arm A^3, the operating rod or arm A to which the said hanging frame A^4 is secured by means of the nut A^5, the said operating rod or bar being passed through an aperture in the said supporting arm or stay A^3, the plate A^2 provided with an aperture through which the operating rod or bar A passes, the loop A' provided at the upper end of the operating rod or bar, the coiled spring A^9 encircling the rod A and operating between the plate A^2 and the loop A', with the guiding-plate C designed to be secured to the rails of the track near the point of the switch-tongue, all as and for the uses and purposes herein fully set forth and substantially specified.

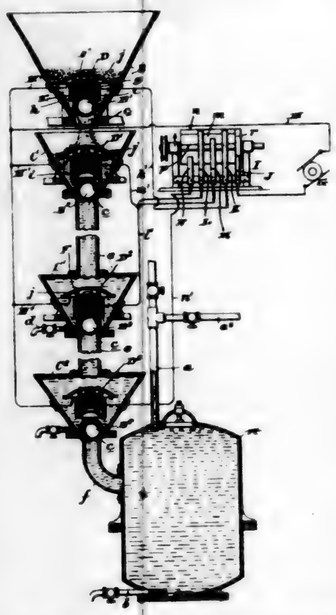
709,135. **ORE-LEACHING APPARATUS.** JAMES BROWN, Tonopah, Nev. Filed Mar. 25, 1902. Serial No. 99,954. (No model.)

Claims.—1. An apparatus for leaching ores comprising a tank adapted to contain water or other liquid, a vertical conduit or hollow column connected to and extending upwardly from the tank, and adapted to contain a leaching solution, and one or more valves in the vertical conduit or hollow column for controlling the gravitation of pulp therethrough.

2. An apparatus for leaching ores comprising a tank adapted to contain water or other liquid, a conduit connected to and extending upwardly from the tank and adapted to contain a leaching solution, one or more valves in the conduit for controlling the passage of pulp through the same, and a hood or hoods disposed above the valve or valves and adapted to spread and deflect the pulp so as to enable the same to pass the valves.

3. An apparatus for leaching ores comprising a tank adapted to contain water or other liquid, a conduit connected to and extending upwardly from the tank and adapted to contain a leaching solution, valves arranged one above the other in the conduit for controlling the passage of pulp through the same, and valve-controlling mechanism arranged when operated to simultaneously effect the closure of one valve and the opening of the other and vice versa, alternately.

4. An apparatus for leaching ores comprising a tank adapted to contain water or other liquid, a conduit connected to and extending upwardly from the tank, valves arranged one above the other in the conduit for controlling the passage of pulp through the same, electromagnets for controlling the valves, an electrogenerator, a movable commutator, and circuit-wires connecting the electromagnets, the generator and the commutator; the said commutator being adapted to change the circuits and the condition of the magnets at intervals, so as to open one valve and close the other simultaneously.



5. An apparatus for leaching ores comprising a tank adapted to contain water or other liquid, a conduit connected to and extending upwardly from the tank and having the plurality of chambers, a hopper disposed above the upper chamber, ball-valves for controlling the discharges of the chambers and hoppers, electromagnets disposed above the valves and adapted when energized to raise the same, the hoods and deflectors arranged in the chambers and hopper above the electromagnets, an electrogenerator, a movable commutator, and circuit-wires connecting the magnets, generator and commutator; the said commutator being adapted to change the circuits and the condition of the magnets, substantially as specified.

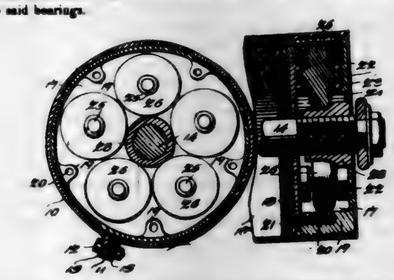
6. An apparatus for leaching ores comprising a tank adapted to contain water or other liquid, a vertical conduit or hollow column connected to and extending upwardly from the tank, and adapted to contain a leaching solution; said conduit or column being made up of chambers arranged one above the other in vertical series and tubes connecting said chambers together and to the tank, valves controlling the discharges of the chambers of the conduit, and valve-controlling mechanism arranged when operated to simultaneously effect the closure of one valve and the opening of the other and vice versa, alternately.

709,136. **ROLLER-BEARING.** CLARENCE A. CARMAN, Bayshore, N. Y., assignor of one-third to Benjamin P. Field, Babylon, N. Y. Filed Jan. 17, 1902. Serial No. 90,211. (No model.)

Claims.—1. The combination in a bearing, of the bearing-box, a removable lid thereon, an annular series of ball-races each comprising an annular flange, antifriction-balls adapted to said ball-races, holding-rings carried by the flanges for retaining said balls in position, disk rollers having curved peripheries and adapted to the bearings formed by said balls, substantially as specified.

2. The combination in a bearing, of the longitudinally-adjustable bearing-box having a series of inwardly-projecting lugs, a disk adapted to be seated on said lugs, means for securing the disk in position, an annular series of bearings arranged in longitudinally-alining pairs on the

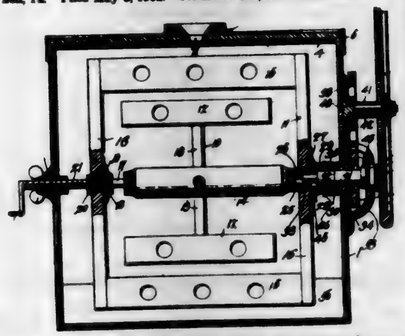
box and disk, and reversible roller-disks having shafts or trunnions adapted to said bearings.



3. The combination in a bearing, of the support 10 having internal threads, a longitudinally-adjustable bearing-box 17 adapted to the threads at each end of the support, a series of inwardly-projecting lugs 19 carried by the bearing-box, a disk 18 adapted to be seated on and secured to said lugs, a series of annular flanges 22 carried by the box and disk and arranged in longitudinally alining pairs, antifriction-balls 23 adapted to ball-races formed by said flanges, rings 24 for holding said balls in position, disk rollers 26 having shafts or trunnions 25 adapted to be supported by the antifriction-balls, a shaft 14, and a sleeve 28 carried by said shaft and having bearing-surfaces 29 for contact with the disk rollers, substantially as specified.

4. The combination in a bearing, of a plurality of sets of disk rollers arranged side by side, the edges of one set overlapping the edges of the adjacent set, bearing-supports for said disk rollers, and a bearing-sleeve having separate inclined bearing-surfaces for each set of disk rollers.

709,137. **CENTRIFUGAL CHURN.** WALTER B. CHALFANT, Brasnell, Pa. Filed May 6, 1902. Serial No. 106,187. (No model.)



Claim.—1. A churn comprising inner and outer dashers, inner and outer shafts connected with the dashers, the inner shaft being slidable and provided with means for engaging the outer shaft, whereby it is interlocked with the latter when it is moved inward, and gearing connected with the shafts for reversely rotating the dashers, said gearing having a gear-wheel carried by the inner shaft, and adapted to be thrown out of mesh by the inward movement of the same to permit the dashers to be rotated in the same direction when the inner and outer shafts are interlocked, substantially as described.

2. A churn comprising a pair of dashers, shafts connected with the dashers, one of the shafts being slidable in the other and provided with means for interlocking it with the same, and gearing connected with the shafts for rotating the same in opposite directions, said gearing having an element carried by the slidable shaft and arranged to be thrown out of mesh by the same, whereby both dashers will be rotated in the same direction when the shafts are interlocked, substantially as described.

3. A churn comprising inner and outer dashers having sockets, the inner dasher being journaled on the outer dasher, an outer tubular shaft engaging the socket of the outer dasher, an inner shaft rotating within the outer shaft and provided at its inner end with means for engaging the socket of the inner dasher, said inner shaft being provided at its outer end with means for interlocking it with the outer shaft and being slidable to carry it into and out of such engagement, inner and outer pinions mounted on the said shafts, a gear-wheel meshing with the inner pinion, and an internal gear-wheel connected with the said gear-wheel and meshing with the outer pinion, the latter being movable with the inner shaft and adapted to be carried out of mesh by the inward movement of the same, substantially as described.

4. A churn comprising inner and outer dashers having sockets, an outer tubular shaft provided at its inner end with means for engaging the socket of the outer dasher, an inner pinion mounted on the outer shaft and having a recess or socket, an inner slidable shaft provided at its inner end with a reduced portion engaging the socket of the inner dasher, said inner shaft being also provided at its outer end with a portion for engaging the recess or socket of the inner pinion, an inner gear-wheel meshing with the inner pinion, an outer internal gear-wheel connected with the inner gear-wheel, and an outer pinion carried by the inner shaft and meshing with the internal gear-wheel and adapted to be carried out of engagement with the same by the inward movement of the said inner shaft, substantially as described.

5. A churn comprising inner and outer dashers, inner and outer shafts interlocked with the dashers, an inner pinion mounted on the outer shaft, means carried by the inner shaft for engaging the inner pinion to interlock the inner shaft with the outer shaft, an outer pinion carried by the inner shaft, an inner gear-wheel meshing with the inner pinion, an outer internal gear-wheel connected with the said gear-wheel and meshing with the outer pinion, a support receiving the outer portion of the inner shaft, and means carried by the support for engaging the inner shaft to secure the same in either of its positions, substantially as described.

6. A churn comprising inner and outer dashers, inner and outer shafts secured to the dashers, the inner shaft being extended beyond the outer shaft and provided with grooves, an inner pinion mounted on the outer shaft, means carried by the inner shaft for interlocking it with the outer shaft, gearing connecting the shafts and having an element carried by the inner shaft, and a fastening device mounted on a suitable support and arranged to engage the grooves to retain the inner shaft in either position, substantially as described.

7. A churn comprising an outer dasher provided at one side with a bearing-plate having inner and outer bearing-recesses, said outer dasher being also provided at its other side with a socket having a bearing, an inner dasher having a journal arranged in the inner recess of the bearing-plate, said inner dasher being also provided with a socket journaled in the bearing of the socket of the outer dasher, an adjusting-screw engaging the outer recess of the bearing-plate and supporting the dashers at one side of the churn, inner and outer shafts located at the outside of the churn and detachably interlocked with the sockets of the dashers, and gearing connected with the inner and outer shafts and adapted to rotate the dashers either in the same direction or in opposite directions, substantially as described.

709,138. **WATERPROOF SCARF.** WILLIAM O. CRIMMOLE, Glasgow, Scotland. Filed June 7, 1901. Serial No. 63,501. (No model.)

Claim.—1. In a waterproof scarf the combination of a shaped lower part having bent-in edges, a shaped upper part having turned-back sides, means for fastening these two parts together, a backing-piece secured to both parts, a hinged extension or flap on the upper part, a crescent-shaped piece secured to the flap and a piece of fabric for strengthening the joint of the flap, substantially as described.

2. In a waterproof scarf the combination of a shaped lower part, a shaped upper part, means for fastening these parts together, a backing-piece secured to both parts, a hinged flap on the upper part, a crescent-shaped piece secured to the flap, a hole in the backing-piece, a stud passed through the hole and a tab secured to the lower part around which an elastic loop secured to a front one be passed, substantially as described.

709,139. CANDY-COOLER. GEORGE S. COLLIS, Hartford, Conn. Filed May 19, 1902. Serial No. 107,802. (No model.)

Claim.—1. A candy-cooler having a bed with a water-receptacle and perforated abutments at intervals on the bed outside of the walls of the receptacle, a plate over the receptacle, and bolts extending through the abutments into threaded sockets in the plate, substantially as specified.

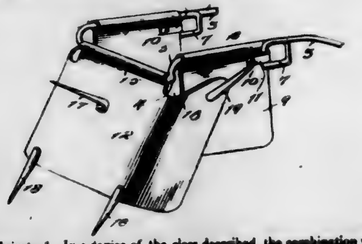
2. A candy-cooler having a bed with a water-receptacle, a plate over the receptacle, packing between the upper edge of the walls of the receptacle and the under face of the plate, and means for holding the bed and plate together, substantially as specified.

3. A candy-cooler having a bed with a water-receptacle and perforated abutments extending upwardly at intervals on the bed outside of the walls of the receptacle, a plate over the receptacle, packing between the upper edge of the walls of the receptacle and the under face of the plate, and bolts extending through the abutments into threaded sockets in the plate, substantially as specified.

4. A candy-cooler having a bed with a water-receptacle and transverse dams extending across the receptacle near each end, a plate over the receptacle, packing between the upper edge of the walls of the receptacle and the under face of the plate, and means for holding the bed and plate together, substantially as specified.

5. A candy-cooler having a bed with a water-receptacle, transverse dams extending across the water-receptacle near each end, perforated abutments extending upwardly at intervals on the bed outside of the walls of the receptacle, a groove in the upper edge of the walls of the receptacle, a packing located in said groove, a plate resting upon the packing, and bolts extending through the abutments from below the bed into threaded sockets in the under face of the plate, substantially as specified.

709,140. CALF-WEANER. DANIEL DASSETT, Lexington, Nebr. Filed June 6, 1902. Serial No. 110,491. (No model.)



Claim.—1. In a device of the class described, the combination with the frame the sides whereof have downwardly-extending shoulders connected by a front cross-piece, of a shield hinged upon said cross-piece and side shields having rigid connection with the side pieces adjacent to the shoulders thereof, substantially as set forth.

2. In a device of the class described, the combination with the frame the sides whereof have downwardly-extending shoulders connected by a front cross-piece, and loops formed at a distance from said shoulders, of a shield hinged upon said cross-piece, and side shields mounted upon the sides of the frame adjacent to the shoulders thereof and connected rigidly with the loops, substantially as set forth.

3. In a device of the class described, the combination with the frame the sides whereof have downwardly-extending shoulders connected by a front cross-piece, and loops formed at a distance from said shoulders, of a shield hinged upon said cross-piece, and side shields mounted upon the sides of the frame between the shoulders and the loops thereof and having rigid connection with said loops by means of staples or keepers engaging the same, substantially as set forth.

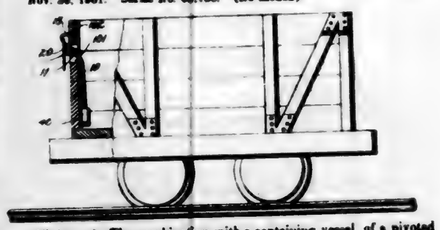
4. In a device of the class described the combination with the frame the sides whereof have downwardly-extending shoulders connected by a front cross-piece, and loops formed at a distance from said shoulders, of a shield hinged upon said cross-piece and having rearwardly-bent sides formed with upwardly and rearwardly extended upper edges, and side shields mounted upon the side bars of the frame, between the shoulders and the loops thereof and having keepers or staples engaging the same to form a rigid connection therewith, the said parts being relatively so disposed that when the front shield swings forwardly the wings or extensions of the sides thereof shall partially extend over the said side shields, substantially as set forth.

5. The combination with the frame having downwardly-extending shoulders connected by a front cross-bar, and formed with approximately rectangular loops at a distance from said shoulders, of the depending shields mounted upon said frame between said shoulders and rectangular loops, and staples or keepers, inclosing the adjacent sides of said rectangular loops and shields and having rigid connection with the latter, substantially as set forth.

6. The combination with the frame having downwardly-extending shoulders connected by a front cross-bar and formed with loops at a distance from said shoulders, of the side shields mounted upon the said frame between said shoulders and loops and having rigid connection with the latter, and the front shield hinged upon the front cross-bar and having sides provided with rings or extensions overlapping said side pieces, and prongs or barbs attached to said front shield, substantially as set forth.

7. The combination with the frame having downwardly-extended shoulders connected by a front cross-bar, and side shields mounted upon said frame, adjacent to said shoulders and having rigid connection with said frame, of the front shield having an upwardly-extended central portion having hinge connection with the front cross-bar and rearwardly-extending side pieces the upper edges of which are extended upwardly and rearwardly to form wings, substantially as set forth.

709,141. AUTOMATIC CHECK-LOCK. HUGH W. DENISON, Glade, Pa., assignor of one-half to James S. Hershberger, Grantsville, Md. Filed Nov. 26, 1901. Serial No. 83,780. (No model.)



Claim.—1. The combination with a containing vessel, of a pivoted holder for supporting a check on the exterior of the vessel, said holder extending within the interior of said vessel and being held in check-locking position by engagement with the contents of the vessel.

2. The combination with a containing vessel, of a check-holder extending through a wall of the vessel, that portion of the check-holder on the exterior of the vessel forming a check-receiving hook, and that portion of the holder on the interior of the vessel being engaged by the contents of the vessel and maintained in check-locking position by the weight and pressure of such contents.

3. The combination with a containing vessel, of an automatic check-holder comprising a weighted hook pivotally connected to said vessel and adapted to be held in locking position by gravity when the vessel is level, and to move by gravity to unlocking position when the vessel is tilted.

4. A check-lock for a mine-car, comprising a pivoted check-holding device extending through the body of the car and having an exteriorly-disposed check-holding hook, the bill of which is adapted to partly enter a recess in the car-body, the inner portion of said check-lock being engaged and held in check-locking position by the contents of the car.

5. A check-lock for mine-cars, comprising a bar adapted to extend through an opening in the car-body, means disposed at the lower end of said bar adapted to be engaged by the material placed in the car, means for pivotally securing said bar to the car-body, and a check-holder attached to the outer end of said bar adapted to close when the car is in normal position, and to open when the car is tilted.

6. An automatic check-lock for mine-cars, comprising a bar having a secondary bar rigidly secured to the lower end thereof at right angles thereto, means connected with the upper end of said bar for pivotally attaching it to a car-body, and a check-holding hook arranged on the upper outer end of said bar and adapted to be forced against the side of the car by the weight and pressure of the contents of the car.

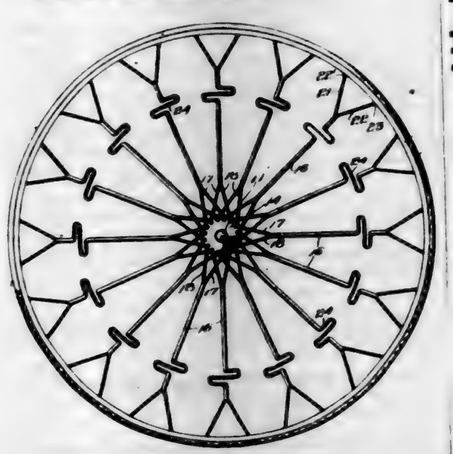
7. An automatic check-lock for mine-cars, comprising a bar bent at its upper end to form a lateral arm, a loop formed on said arm, a rod adapted to extend through said loop and pivotally secure it to the car-body, a check-holder connected with said loop and adapted to close tightly against the car-body, and means connected with said bar whereby the check-holder is normally held closed.

8. An automatic check-lock, comprising a bar bent at its upper end to form an arm, a loop on said arm, means adapted to extend through said loop and secure it to the car-body, and a transverse bar attached to the lower end of said bent bar adapted to be engaged by the material placed in the car and thereby lock the check-holder to prevent opening after loading of the car has begun.

9. An automatic check-lock for mine-cars, comprising a pivotally-mounted vertically-disposed bar bent at its upper end to form a loop, said bar being again bent outward to form a hook, and a transverse bar connected to the lower end of said vertical bar against which the material placed in the car abuts.

10. An automatic check-lock, comprising a bar adapted to be pivotally connected to a car-body, a check-holder on one end thereof, and means connected with the other end thereof for automatically closing said holder when the car is in normal position and for opening it when the car is tilted.

709,142. SPRING-WHEEL. JOSEPH DUCAIRE, Alpena, Mich. Filed May 20, 1902. Serial No. 108,566. (No model.)



Claim.—1. In a wheel of the class described, a spoke having a bifurcated inner or hub end, each member of the fork thus formed being divided at an angle to the bifurcation.

2. In a wheel of the class described, a spoke having a bifurcated inner or hub end, each end of the fork thus formed being divided at an angle to the line of bifurcation and the outer end of said spoke being likewise forked for attachment to the rim.

3. A spoke having bifurcated outer and inner ends, the members of the fork at the inner end being subdivided at an angle to the line of bifurcation, said spoke having an intermediate spring.

4. A spoke having bifurcated outer and inner ends, the members of the fork at the inner end being subdivided at an angle to the line of bifurcation, said spoke having an intermediate S-shaped bent portion forming a spring.

5. A wheel comprising a rim, a centrally-disposed hub with flanges upon its ends having spaced perforations, spokes having forked inner ends engaging said perforations with one or more perforations between each adjacent pair of said forked ends, whereby the forks of each of the spokes engage the one or more perforations between the forks of the adjacent spokes, and with springs in said spokes between said forked ends and said rim, substantially as described.

6. A wheel comprising a rim, a centrally-disposed hub having spaced flanges on its ends, spokes having forked extremities engaging said hub and rim, and with springs in said spokes between said bracing ends, substantially as described.

7. A wheel comprising a rim, a centrally-disposed hub having spaced flanges on its ends, spokes having forked extremities engaging said hub and rim, and with the portion between the forked ends bent into S shape, whereby the spokes are bracingly connected to the hub and rim, and resilient portions provided in the spokes between said forked ends, substantially as described.

8. A wheel comprising a rim, a centrally-disposed hub formed with lateral flanges on its ends with spaced perforations therein, spokes having diverging braces engaging said flanges at opposite points and at separate points on the flanges with one or more of said perforations between each adjacent set of said braces, whereby each of said braces engages one or more of said perforations in said opposite flanges between the forked ends of the adjacent spokes, substantially as described.

9. A wheel comprising a rim having concaved outer surface, a yieldable tire supported in said concave, a hub having lateral flanges upon its ends with spaced perforations therein, spokes having forked inner ends engaging said perforations and with forked outer ends engaging said rim, and springs in said spokes between said forked ends, substantially as described.

10. In a wheel, a rim having concaved outer surface, a yieldable tire supported in said concave, a hub having lateral flanges upon its ends with spaced perforations therein, spokes having forked inner ends engaging said flanges, and with forked outer ends engaging said rim, substantially as described.

11. A wheel comprising a rim, a centrally-disposed hub having spaced lateral flanges at its ends, spokes having forked portions diverging therefrom and engaging said flanges at opposite points, and springs in said spokes between said hub-engaging forked portion and rim, substantially as described.

12. A wheel comprising a rim, a centrally-disposed hub, spaced spokes having forked inner ends engaging said hub at separated points, and springs in the spokes between said hub and said rim, substantially as described.

709,143. SOAP-HOLDER. ARTUS E. DUSEK, Crowlake, S. D., assignor of one-half to Joseph W. Dusek, Crowlake, S. D. Filed May 1, 1902. Serial No. 105,463. (No model.)

Claim.—1. A soap-holder consisting of two jaws connected together, one of said jaws being provided with a spring which exerts its energy to force its jaw toward its coacting jaw, and means for spreading said jaws apart and holding them in position to permit of the insertion of a cake of soap between said jaws, said means consisting of a lever pivoted at one end to one of the jaws and at its other end having a sliding connection with the other jaw, substantially as set forth.

2. A soap-holder consisting of two jaws the inner ends of which are parallel, arched and connected together, one of said jaws being formed with a spring-bow, clips connecting the parallel ends of the jaws and preventing spreading of the same, a fastening device adapted to be inserted between the parallel ends of the jaws, and a lever pivoted to one jaw and having an eye which embraces the other jaw and is designed to hold said jaw in spread position, substantially as set forth.

709,144. GAME APPARATUS. CLARENCE E. EGGERLY, Biddeford, Me. Filed Aug. 23, 1901. Serial No. 73,009. (No model.)

Claim.—1. A game apparatus comprising an inclosure having a pocket for the reception of a playing-piece, and a curved wire guard ar-

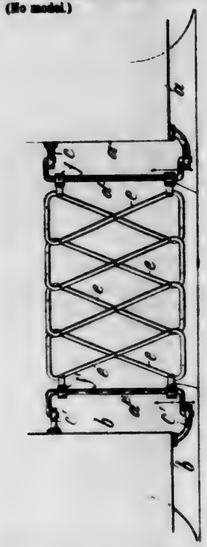
ranged in front of and at a distance from the mouth of the pocket and in a plane above that of the playing-piece.

2. A game apparatus comprising an inclosure having a bottom playing-field surrounded by a yielding cushion and provided with a goal or pocket at each end for the reception of a playing-piece, and a guard disposed in front of and at a distance from the mouth of each goal, said guards being arranged in a plane above that of the playing-piece.

3. A game apparatus comprising an inclosure having goals or pockets for the reception of a playing-piece, and inwardly-projecting curved guards, arranged at a distance from the mouth of each goal thereby to prevent the closing of the mouth of the goal by the impelling device.

4. A game apparatus comprising in combination, an inclosure having a goal or pocket for the reception of a playing-piece, a curved guard disposed in front of the mouth of the pocket in a plane above that of the playing-piece, and an impelling device adapted to engage in front of said guard, said impelling device being of a width less than that of the goal or pocket.

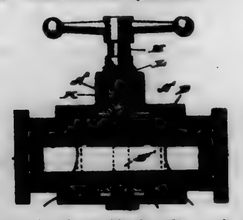
709,145. **GUARD DEVICE FOR COUPLED CARS.** JACOB REESHAFF, Frankfort-on-the-Main, Germany. Filed Jan. 14, 1902. Serial No. 89,763. (No model.)



Claim.—1. A guard for the space between two adjoining cars, comprising a lazy-tongs, having its members bent into Z shape, and posts to which the opposite ends of the lazy-tongs are connected, and supporting devices on the ends of cars to which said posts are detachably secured, substantially as described.

2. The combination with eyes attached to ends of adjoining cars, the removable posts having their ends bent at right angles and then down to engage the eyes, and a lazy-tongs connected to and between said posts, for the purpose and substantially as described.

709,146. **STRAIGHTWAY VALVE.** EDWARD M. ERDMAN, Pottsville, Pa., assignor of one-half to William J. Matz, Pottsville, Pa. Filed Nov. 21, 1901. Serial No. 83,130. (No model.)



Claim.—In a valve, the combination with a casing having a cylindrical transverse chamber, of a valve comprising a cylindrical plug fitting said chamber and of appreciably less height than the chamber, said valve having a transverse passage and being cut away on two opposite sides, the cut-away portions having end shoulders parallel with the longitudinal axis of the valve and a central groove whose inner face tapers inwardly from top to bottom, a block fitting each cut-away portion of the plug and having parallel ends on which said shouldered ends of the valve slide, and a central rib fitting said groove and having a corresponding taper, a central stem integral with the valve and having a screw-thread mating with a similar thread in the casing, and a central stud on the lower end of the valve rotatably received in a recess in said casing to guide the valve, said blocks fitting the inside of the chamber and extending from top to bottom thereof and held against up and down movement, and said valve having a limited endwise play in said blocks and abutting against the top or bottom of the casing at each end of its rotary movement in opening and closing.

709,147. **COTTON-CHOPPER.** LOUIS P. FAY, Denison, Tex. Filed July 1, 1902. Serial No. 113,945. (No model.)

Claim.—1. In a cotton-chopper, a blade consisting of a central longitudinal and two outer diverging wings, said central wing being extended upwardly and forwardly and partially clamped around the curved rear portion of a draft-rod, substantially as set forth.

2. In a cotton-chopper, a blade consisting of a central longitudinal and two outer diverging wings, said blade being formed with a central longitudinal ridge and said central wing being extended upwardly and forwardly and partially clamped around the curved rear portion of a draft-rod, said curved portion being extended under the ridged central portion of the blade, substantially as set forth.

3. In a cotton-chopper, a blade having rearwardly-diverging wings provided with upturned rear ends forming brackets, and blades secured to said brackets and having cutting edges extending beyond the outer edges of the rearwardly-diverging wings, substantially as set forth.

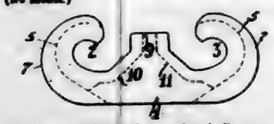
4. In a cotton-chopper, a blade having rearwardly-diverging wings provided with upturned rear ends forming brackets, and blades secured to said brackets, converging rearwardly, and provided at their front ends with cutting edges extending beyond the outer edges of the rearwardly-diverging wings, substantially as set forth.

709,148. **SASH-FASTENER.** JAMES E GIBBS, Staunton, Va., assignor of one-half to Clarence Preston Herman, Staunton, Va. Filed May 31, 1902. Serial No. 108,681. (No model.)

Claim.—The sash-fastener herein shown and described, consisting of the casing adapted to be secured to the sash, the vertical guideway in said casing, the toothed wheel mounted in the casing under the said guideway, the rack-bar to be engaged by said toothed wheel, the bolt arranged in said guideway for engaging the toothed wheel, a finger-piece on the bolt a finger-piece on the casing, one of said finger-pieces being pivoted and serving as a latch to hold the bolt when in engagement with said toothed wheel

---

709,149. **DRIVING-CHAIN.** ADOLPHE H. GRAFFIGNY and EMANUEL J. BOUVIER, Paris, France. Filed Dec. 16, 1901. Serial No. 86,100. (No model.)

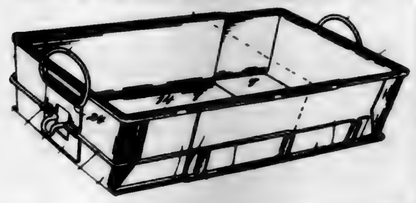


Claim.—1. In a detachable chain, a female link comprising a body portion 1, bifurcated hooked ends 4 and 5 forming transverse recesses 2 and 3, inclined walls 10 and 11 formed in the body portion 1, and guide-flanges 7 formed on the outer faces of the hooks, in combination with a male link comprising a body portion 12, reduced ends 12′ and 12″ adapted to operate between the bifurcated hooked ends 4 and 5 of the female link, pins 13 and 14 formed on said reduced ends and adapted to operate in the transverse recesses 2 and 3 of the female link, and curved shoulders 15 and 16 adapted to coact with the outer ends of the hooks 4 and 5 and to be guided by the flanges 7.

2. In a detachable chain, a female link comprising a body portion 1, bifurcated hooks 4 and 5 on each end thereof, forming between them slots, the inner ends of which are closed by the inclined walls 10 and 11 and said hooked ends forming recesses 2 and 3, in combination with a male link comprising a body portion 12, reduced ends 12′ and 12″ to operate between the hooks 4 and 5, pins 13 and 14 formed on the said reduced ends and adapted to operate in the recesses 2 and 3 of the female link, shoulders 15 and 16 to coact with the outer ends of the hooks 4 and 5, and the portions 17 and 18 of the said shoulders cut away to prevent contact of the said shoulders with the inclined walls 10 and 11 when the chain is used on wheels of relatively small diameter.

3. In a detachable chain, a female link comprising a body portion 1 provided with bifurcated hooked ends, said bifurcations forming slots, inclined walls 10 and 11 closing the inner ends of the said slots, and recesses 2 and 3 formed by the hooked ends, in combination with a male link comprising a body portion 12, reduced ends 12′ and 12″ adapted to operate between the bifurcated hooked ends of the female link, pins 13 and 14 formed on the said reduced ends and adapted to operate in the recesses 2 and 3, and shoulders 15 and 16 arranged at each side of the male link, the said shoulders having curvatures corresponding to those of the hooks of the female link for the purpose of preventing the insertion or removal of the pins 13 and 14 into and from the recesses 2 and 3 except at an angle abnormal to the working angle of the links.

709,150. **EXTENSIBLE PAN.** JESSE T. HALLS, Dumfries, Va. Filed Jan. 16, 1902. Serial No. 89,986. (No model.)



Claim.—1. An extensible pan comprising members telescopically connected, a latch carried by one of the members, and a plurality of sockets carried by the other member for engagement interchangeably by the latch to hold the members at different points of their telescopic adjustment.

2. An extension bread-pan comprising members telescopically connected, one of said members having sockets at its sides, and a U-shaped latch pivoted to the other member and having its ends bent downwardly to engage the sockets interchangeably.

3. An extensible pan comprising members telescopically connected, one of said members having sockets at its sides, and a U-shaped latch having its ends bent downwardly to engage the sockets interchangeably, said latch having its web portion pivotally connected to the second member and having the central portion of the web bent outwardly to form a handle for manipulating the latch.

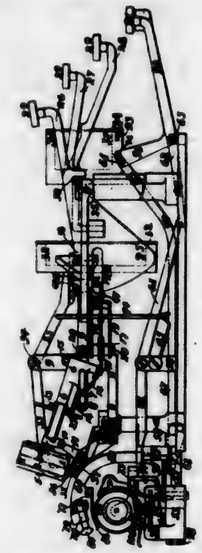
4. An extensible pan comprising separate members each having base and upper edge flanges, the flanges of one member being slidably engaged with the flanges of the other member, a plurality of sockets at each side of one member, and a U-shaped latch having its web pivotally connected with the other member and having its ends bent to form hooks for engagement with the sockets of the other member, the web of the latch being bent outwardly to form a handle for manipulating the latch.

709,151. **BLUE SULFUR DYE AND PROCESS OF MAKING SAME.** RICHARD HERZ, Frankfort-on-the-Main, Germany, assignor to Leopold Cassella & Co., Frankfort-on-the-Main, Germany. Filed Feb. 3, 1902. Serial No. 92,430. (No specimens.)

Claim.—1. The process of producing blue cotton dyestuffs by heating para amidotolyl para oxyphenylamin with polysulfids substantially as described.

2. As a new article of manufacture the blue coloring-matter resulting from the reaction of polysulfids on para amidotolyl para oxyphenylamin which is a dark-blue powder hardly soluble in pure water but easily soluble in the presence of caustic alkalies or sulfids with a reddish-purple color, soluble in concentrated sulfuric acid with a dark-blue color and which dyes unmordanted cotton in a bath containing alkaline sulfids blue shades fast to acids, milling and light substantially as described.

709,152. **TYPE-WRITER.** WILFRED HEBY, Bothwell, Scotland. Filed June 10, 1901. Serial No. 63,929. (No model.)



Claim.—1. A type-writer having a type-wheel, a shaft carrying it, and a bracket-piece carrying the shaft, guides at one end of the bracket in which each end of the bracket is adapted to slide, and a bell-crank connected to the other end of the bracket, adapted to move each end through the radius of movement of the bell-crank, whereby the type-wheel is caused to advance to print a character upon the partial revolution of the bell-crank, substantially as described.

2. A type-writer having a type-wheel, a rotatable shaft therefor, a bell-crank having a shaft at right angles to the type-wheel shaft and connected to and adapted to move said type-wheel and shaft at its outer end, in the radial path of movement of the bell-crank and guides adapted to guide the inner end of said shaft and so determine the printing position of the type-wheel, substantially as described.

3. In combination with the printing mechanism of a type-writer, a pair of stop-levers on a common center, means to move them in opposite directions, in combination with character-determining stops, said stop-levers adapted to bear on the opposite sides of the character-determining stops and connections between the levers whereby one lever prevents the rebound of the other, substantially as described.

4. In combination with the printing mechanism of a type-writer, a pair of stop-levers adapted to move in opposite directions, in combination with character-determining stops, said stop-levers adapted to bear on the opposite sides of the character-determining stops and connections between the levers whereby one lever prevents the rebound of the other, substantially as described.

5. A type-writer having a pair of stop-levers, adapted to move in opposite directions, and character-determining stops on the opposite sides of which the levers are adapted to bear, in combination with arms controlled by the stop-levers, a rotatable type-wheel and means between the arms and the type-wheel to rotate the wheel, substantially as described.

6. A type-writer having a pair of stop-levers, adapted to move in opposite directions and character-determining stops on the opposite sides of which the levers are adapted to bear, in combination with arms operated by the stop-levers, a bevel-sector on the arms, a rotatable type-wheel and shaft and a bevel-wheel on the shaft engaging the bevel-sector, as described.

7. A type-writer having a pair of stop-levers adapted to move in opposite directions, and character-determining stops, arms connected to the levers, in combination with a bevel-sector on the arms, a type-wheel and shaft, a bracket therefor, guides for the bracket at one end and a bell-crank at the other, and a bevel-wheel on the shaft engaging with the bevel-sector, all substantially as described.

8. A type-writer having a bracket-piece, a rotatable type-wheel and shaft, a bevel-wheel on the shaft, a bevel-sector, all carried by the bracket-piece, means to advance the bracket-piece, and stop-levers to control it, and character-determining stops whereby the type-wheel is rotated to the

predetermined character, upon the advance of the bracket-piece, in combination with other means for holding the rotated type-wheel from turning upon the further advance of the type-wheel to impress the predetermined character, substantially as described.

9. A type-writer having a type-wheel, a shaft and a bevel-wheel and a bracket in which they are mounted, said bracket having guides at one end in which it may be moved more or less horizontally and a bell-crank at the other end, in combination with character-determining stops, stop-levers and a bevel-sector controlled thereby and engaging the said bevel-wheel, substantially as described.

10. A type-writer having a type-wheel and a shaft, a bracket-piece, guides in which it may be moved at one end, and a bell-crank lever at the other end, a bevel-wheel on the shaft in combination with key-levers, stop-levers and stops, a bevel-sector connected with said levers and adapted to operate the bevel-wheel, said stop-levers being adapted to be arrested by the inner end of the key-levers upon the depression of the keys, substantially as described.

11. A type-writer having a type wheel and a shaft, a bracket-piece, guides in which it may be moved at one end, and a bell-crank at the other end, a bevel-wheel on the shaft, in combination with key-levers, stop-levers and stops, a bevel-sector connected with said levers and adapted to operate the bevel-wheel, said stop-levers being adapted to be arrested by the inner end of the key-levers upon the depression of the keys, said inner ends of the key-levers being of varying lengths, a driving-lever, a number of curved bars thereon and connected to said bell-crank, the varying inner ends of the key-levers engaging the different bars, substantially as described.

12. A type-writer having a type-wheel mechanism, a common driving-lever, key-levers, having a common fulcrum, said key-levers having different lengths of ends, and parts so placed on the common lever as to coöperate with such varying ends to accomplish the same angular movement of the common lever whether the key-levers struck have long or short ends, substantially as described.

13. A type-writer having type-wheel mechanism, a common driving-lever, key-levers having a common fulcrum, said key-levers having different lengths of ends, and parts on the common lever so displaced with reference to such varying ends as to accomplish the same angular movement of the common lever whether the key-levers struck have long ends or short ends, said parts on the common lever and said common fulcrum being arranged in curves of suitable radii, substantially as described.

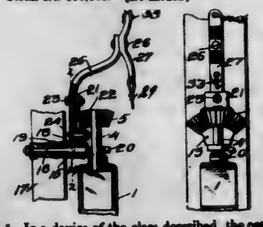
14. A type-writer having a common driving-lever, a type-wheel and rotating mechanism therefor, in combination with a bell-crank to move the type-wheel, having jaws, a pin on the driving-lever engaging the jaws, and key-levers, each one of which is adapted to operate the common driving-lever, substantially as described.

15. A type-writer having stop-levers, a type-wheel and rotating mechanism, and means for forwardly moving the type-wheel, adjustable pins adapted to engage the ends of the stop-levers upon the return movement of the type-wheel to restore the type-wheel to its normal position, substantially as described.

16. A type-writer having stop-levers adapted to be arrested by key-controlled projections, said levers having wings adapted to prevent the raising of a second key-lever projection in the wake of the stop-levers, substantially as described.

17. A type-writer having a type-wheel, an inking-roller, a lever therefor having its axis inclined to the vertical and at one side of the type-wheel, whereby the roller is adapted to be pushed aside by the descending type-wheel, a spring to normally hold the lever in position for inking and a pointer-arm on the lever, substantially as described.

709,158. GATE. JESSE J. HUDDING, Ferndale, Cal. Filed May 26, 1902. Serial No. 109,070. (No model.)

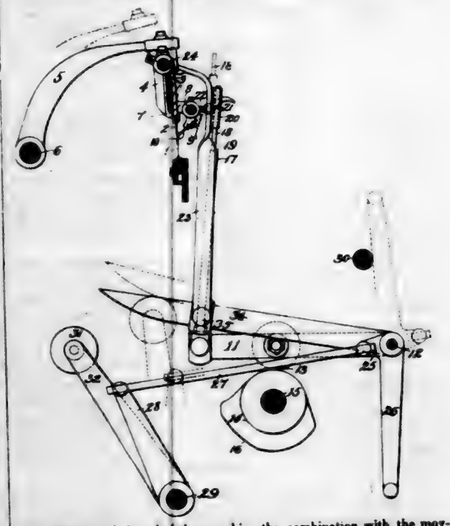


Claim.—1. In a device of the class described, the combination with a swinging gate, and a hinge-post, of a cap mounted on the gate and provided with a vertical shaft forming a pintle, a bolt secured to the hinge-post and provided adjacent to the same with a bearing portion and having an eye receiving the said shaft, a pinion mounted on the upper end of the shaft, a plate provided with an eye arranged on the bearing portion of the bolt, said plate being also provided with a curved series of teeth meshing with the said pinion, an arm extending from the plate, and a pivoted latch-operating lever mounted on the arm, substantially as described.

2. In a device of the class described, the combination with a swinging gate and a hinge-post, of a cap mounted on the gate and provided with a short vertical shaft, a bolt extending from the hinge-post and provided with a bearing portion and having an eye located beyond the bearing portion and receiving the vertical shaft, a bevel-pinion mounted on the shaft, a sector-plate provided at its lower end with an eye to receive the bearing portion of the bolt and having an extension at the top, said sector-plate being also provided with an inclined upper portion having a curved series of teeth meshing with the pinion and the lower portion of the sector-plate being provided with a rearwardly-extending lug, an arm secured to the lug and to the extension and extending forward and upward over the pinion, and a latch-lever fulcrumed on the upper end of the arm, substantially as described.

3. In a device of the class described, the combination with a hinge-post, and a gate, of a bearing-bracket supporting the bottom of the gate, a cap secured to the gate at the top thereof and having a vertical shaft, a bevel-pinion secured to the upper end of the vertical shaft, a horizontal bolt mounted on the post and having an eye receiving the shaft, said bolt being also provided between the eye and the post with a bearing portion, a sector-plate provided at its lower end with an eye to receive the bearing portion of the bolt and having an inclined portion provided with teeth meshing with the pinion, said plate being extended at the top and provided at the rear with vertical flanges and having a lug at the lower portions thereof, an arm secured to the plate and arranged between the flanges thereof, a latch mounted on the gate, a latch-lever fulcrumed on the arm and connected with the latch, and flexible connections extending from the latch-lever, substantially as described.

709,154. KNITTING-MACHINE. HENRY JARMEN, Reading, Pa., assignor to Textile Machine Works, Incorporated, Reading, Pa. Filed Feb. 20, 1902. Serial No. 94,578. (No model.)

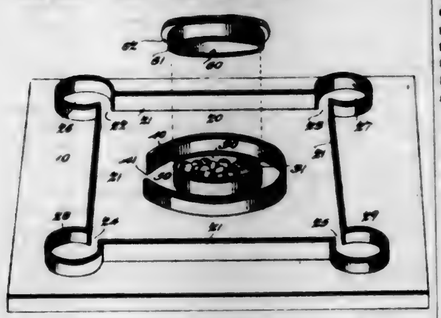


Claim.—1. In a knitting-machine the combination with the movable narrowing mechanism and the lever carried thereby, of the swinging arm arranged to engage and raise said lever and narrowing mechanism, and the hand-lever having an arm connected to said swinging arm and a limited movement arranged to carry the point of connection slightly over the dead-center to lock said swinging arm in its elevating position, substantially as set forth.

2. In a knitting-machine the combination with the movable narrowing mechanism comprising adjustable points and pivoted guards arranged to contact with said points, of an independent hand-lever mechanism for elevating said narrowing mechanism and an automatic operating mechanism for said guards comprising a device connected to said pivoted guards, an operating-rod therefor having a limited sliding movement in said device, and a lever-and-cam connection to said rod adapted to intermittently raise said device to withdraw the guards from the narrowing-points, substantially as set forth.

3. In a knitting-machine the combination with the movable narrowing mechanism comprising adjustable narrowing-points and pivoted guards arranged to contact with said points, of an automatic operating mechanism for said guards comprising a device pivotally connected to said pivoted guards, a rod having a limited sliding movement in said device, and a lever-and-cam connection to said rod adapted to intermittently raise said device and thereby withdraw the guards from the narrowing-points substantially as set forth.

709,155. GAME-BOARD. JOHN E. JOHNSTON, Trimble, Ohio. Filed Dec. 21, 1901. Serial No. 86,802. (No model.)



Claim.—A game-board comprising a horizontal base, side and end strips secured to the upper face of the base and forming an approximately rectangular inclosure or field and spaced from the edges of the base, said strips being also spaced apart at their ends to form corner-openings, the exterior curved strips mounted on the base beyond the said field or inclosure and connecting the ends of the side and end strips and forming circular corner-pens, and the concentric pens arranged at the center of the field and consisting of strips secured to the base and having their ends spaced apart to form openings, substantially as described.

709,156. ELECTRIC-RAILROAD SWITCH. JAMES A. JOYCE, Cleveland, Ohio. Filed Dec. 17, 1901. Serial No. 86,237. (No model.)

Claim.—1. In a switch with a movable shaft having a switch-point on the upper side, an armature fastened to the shaft having extended pole-pieces encircling the field-coil and acting in conjunction with the same to electromagnetically move the shaft and switch-point, a frame with grooves in the upper side, a drainage-hole under the shaft and switch-point, a water-tight compartment having a U-shaped support for field-coils and adapted to support the shaft and cover the electric mechanism, and an insulated section of trolley-wire from which the current passes to the armature and field-coils, when a car passes over the said insulated section of trolley-wire to open or close the switch, substantially as shown and described.

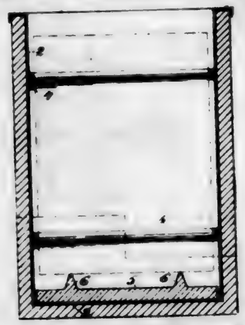
2. In a switch with a movable shaft having a switch-point on the upper side, an armature fastened to the said shaft, acting in conjunction with a field-coil to electromagnetically move the same and a frame adapted to support and to cover the shaft and the electrical mechanism, substantially as shown and described.

3. In a switch with a movable shaft having a switch-point on the upper side, an armature fastened to the shaft, having extended pole-pieces encircling the field-coil and acting in conjunction with the same to electromagnetically move the said shaft and switch-point, and a frame with grooves in the upper side, a longitudinal slot in which the switch-point works, a drainage-hole under said shaft, and a water tight compartment to support and cover the shaft and the electric mechanism, substantially as shown and described.

4. In a switch with a movable shaft having a switch-point on the upper side, an armature fastened to the shaft having extended pole-pieces encircling the field-coil and acting in conjunction with the same to electromagnetically move the shaft and switch-point, a frame with grooves in the upper side, a longitudinal slot in which the switch-point works, a drainage-hole under the said shaft and switch-point, a water-tight compartment to support the shaft and cover the electric mechanism and an insulated rail from which the current passes to the armature and field when a car passes over the said insulated rail which will cause the switch to open or close as desired, substantially as shown and described.

5. In a switch with a movable shaft having a switch-point on the upper side, an armature fastened to the shaft having extended pole-pieces encircling the field-coil and acting in conjunction with the same to electromagnetically move the shaft and switch-point, a frame with grooves in the upper side, a longitudinal slot in which the switch-point works, a drainage-hole under the said shaft and switch-point, a water-tight compartment having a U-shaped support for field-coils and adapted to support the shaft and cover the electric mechanism, and insulated rails from which the current passes to the armature and field-coil, when a car passes over the said insulated rails to open or close the switch, substantially as shown and described.

709,157. JAR FOR STORAGE BATTERIES. PATRICK KENNEDY, Brooklyn, N. Y. Filed Jan. 6, 1902. Serial No. 88,566. (No model.)



Claim.—1. A jar for a storage battery having side guards of soft cushion-like material to serve as buffers to keep the plates or elements out of contact with sides of the receptacle.

2. A jar for a storage battery having a soft-rubber lining and having side guards of soft cushion-like material to serve as buffers to keep the plates or elements out of contact with said lining.

3. A jar for a storage battery having an integral, soft-rubber lining provided with side guards of the same material projecting from its inner surface, substantially as and for the purpose set forth.

4. A jar for a storage battery comprising an outer wooden receptacle, and an integral lining therein of soft rubber, said rubber lining having a top flange which extends over the top of said receptacle and guards 4 formed on its inner face at the sides, substantially as and for the purpose set forth.

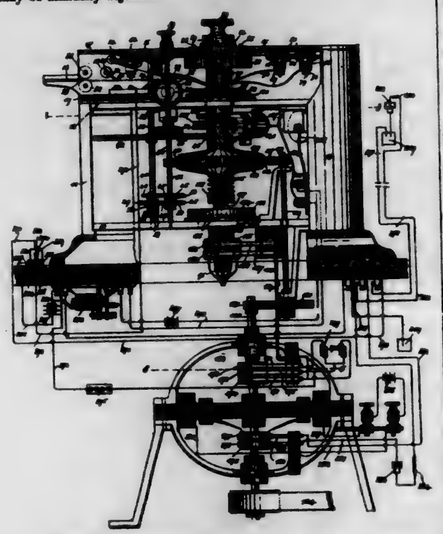
5. A jar for a storage battery having a rubber lining, side guards of yielding material, and a ribbed plate of acid-resisting material set loosely in the bottom of the jar and fitting into the latter, substantially as set forth.

709,158. FACSIMILE-TELEGRAPH. EDWARD R. KLEINSCHMIDT, New York, N. Y., assignor to Frederick Kleinschmidt, New York, N. Y. Filed Nov. 6, 1899. Serial No. 736,288. (No model.)

Claim.—1. In a facsimile-telegraph, a message-paper-feed mechanism embodying a flat table or platen over which the message-paper is adapted to pass in a continuous movement, said message-paper-feed mechanism being insulated from the remainder of the machine, a constantly-rotating stylus-carrier having styluses bearing with relation to said table or platen and maintained in continuous contact with the surface of the message-paper during its passage over the platen, and a contact device mounted in relation to the said platen and adapted to bear upon the surface of the message-paper.

2. In a facsimile-telegraph, a message-paper-feed mechanism, embodying a flat table or platen over which the message-paper is adapted to pass in a continuous movement, rollers mounted with relation to the said platen, means whereby the said rollers may govern the movement of the said paper, a constantly-rotating stylus-carrier provided with styluses bearing with relation to the said table or platen, means for main-

taining the styluses normally in contact with the message-paper during its passage over the platen, means for elevating the said styluses out of contact with the message-paper, a contact device mounted with relation to the table or platen normally connecting with the surface of the message-paper, and means for turning the rollers of the message-paper-feed mechanism independently of the operation of the telegraph-machine, whereby when the styluses are raised out of contact therewith the message-paper may be manually adjusted.



3. In a facsimile-telegraph, a message-paper-feed mechanism, transmitting devices comprised in an electric circuit and adapted to contact with the message-paper during the movement thereof through said feed mechanism, means for continuously operating said feed mechanism in unison with said transmitting devices, means for raising the transmitting devices out of contact with the message-paper, means for operating the feed-paper mechanism independently of movement of the transmitting devices and a contact device mounted in normal contact with the message-paper and having a vertically-movable relation thereto.

4. In a facsimile-telegraph, the combination, with a message-paper mechanism embodying a table or platen over which the message-paper sheet or blank is adapted to pass, of a plurality of continuously-rotating stylus devices comprised in an electric circuit and arranged in a set or series and adapted to have an arc or line of travel across said message-paper, the relative arrangement being such that a plurality of said stylus devices will simultaneously contact with said message-paper; and means for commutating the contacting stylus devices to the line separately and successively.

5. In a facsimile-telegraph, means for advancing the message-paper sheet or blank in a continuous movement and a rotary plate or frame carrying a plurality of constantly-rotating transmitting stylus devices comprised in an electric circuit and equidistantly arranged in a circular series, the relative arrangement being such that two or more of said stylus devices will simultaneously be in contact with the message-paper sheet or blank during the transmitting operation; and means for commutating the contacting stylus devices to the line separately and successively.

6. In a facsimile-telegraph, a series of styluses comprised in an electric circuit and divided into pairs or sets, the styluses of said respective pairs or sets being adapted to conjointly operate, means for conjointly operating the stylus devices of said respective pairs or sets, and means for commutating said stylus devices of the respective pairs or sets to the line-circuit during their conjoint operative movement.

7. In a facsimile-telegraph, a stylus-carrier, comprising a constantly-rotating plate, a plurality of stylus devices mounted thereon, each of which is comprised of a frame having an upper surface upon a plane substantially parallel to the plane of the carrier, and a stylus centrally mounted therein, a fastening device connecting the center of the frame to the stylus carrier or plate and capable of adjustment, whereby to govern the distance of the stylus device from the carrier, and a plurality of separate adjusting devices mounted in said carrier or plate and bearing upon the upper surface of the stylus device or frame at different points.

8. In a facsimile-telegraph, a stylus-carrier and one or more stylus devices mounted thereon, an insulating head or body upon the top of said stylus devices, an adjustable fastening device connecting the said insulating-head centrally to the stylus-carrier, and a plurality of separate adjusting devices mounted in the stylus-carrier and bearing upon the upper surface of said insulating-head at different points.

9. In a facsimile-telegraph, a stylus-carrier comprising a constantly-rotating plate, a plurality of stylus devices connected therewith, each of which is comprised of an upper body or head centrally apertured, means for adjustably connecting said head with the stylus-carrier to regulate both its distance from and its horizontal angle to said stylus-carrier, a cylinder adjustably mounted centrally in said head, means for retaining the same in its adjusted position, and a stylus yieldingly mounted in said cylinder.

10. In a facsimile-telegraph, the combination with a constantly-rotating stylus-carrier having a plurality of stylus devices connected therewith, and a message-paper-feed mechanism operatively connected with the said stylus-carrier, whereby they move in unison; of means for raising and lowering said stylus-carrier and means for adjusting the stylus devices both vertically and laterally with respect to said stylus-carrier and the message-paper.

11. In a facsimile-telegraph, a stylus device comprised in an electric circuit and embodying a cylinder or casing carrying a projecting stylus-rod and adjustably connected with said casing; and a circuit-wire-clamping device adjustably mounted relatively to the said cylinder or casing and adapted to conjointly hold the said cylinder or casing in its adjusted position and the said circuit-wire in connection therewith.

12. In a facsimile-telegraph, a stylus device comprised in an electric circuit and embodying a base or body by which it is mounted in position, a cylinder or tubular casing adjustably connected with said base and carrying a projecting stylus-rod, a set-out operating upon said casing and binding against said base, and an auxiliary set-out operating upon said casing and between which and the main set the circuit-wire is adapted to be bound.

13. In a facsimile-telegraph, a stylus-carrier adjustable in a longitudinal plane with relation to the plane of operative projection of the stylus device, and a stylus device comprised in an electric circuit and carried by said stylus-carrier and independently adjustable with relation thereto both in a longitudinal and lateral plane with relation to its plane of operative projection.

14. In a facsimile-telegraph, a stylus-carrier, a stylus device comprised in an electric circuit and embodying a disk or base, a device centrally connecting said base with the stylus-carrier, and set-screws operating between said carrier and base at points outside said central connection.

15. In a facsimile-telegraph, a constantly-rotating stylus-carrier carrying stylus devices, a plurality of which are constantly in contact with the message-paper, a rotary shaft connected centrally with said stylus-carrier, and exteriorly carrying an electric commutator divided into a plurality of segments arranged to severally connect with the styluses, whereby to commutate the contacting styluses to the circuit-line and circuit connections from the said commutator interiorly of the said shaft to the said stylus devices.

16. In a facsimile-telegraph, stylus-operating mechanism, and means actuated by the actual writing impulses over the transmitting or writing circuit for stopping and releasing said mechanism.

17. In a facsimile-telegraph, a stylus-operating mechanism, and means actuated by the actual writing impulses over the transmitting or writing circuit for starting said machine and for stopping said mechanism by the absence of such writing impulses.

18. In a facsimile-telegraph, the combination with the mechanism for operating the styluses, of a unison-magnet comprised in an electric circuit, and having its armature adapted to operatively connect with said mechanism to stop or release the same; and means, for actuating said unison-magnet, whereby the actual writing impulses sent over the line will start or release the mechanism and the absence of said impulses will operate to cause said magnet to stop the machine.

19. In a facsimile-telegraph, a plurality of styluses, mechanism for operating the styluses, an electromagnet, devices operated by the armature of the latter, guide devices comprised in said stylus-operating mechanism and adapted to guide said armature-operated devices in their operative contact and stop devices comprised in the stylus-operating mechanism and relatively arranged at the terminal of said guide devices and adapted to be engaged by said armature-operated devices.

20. In a facsimile-telegraph, a plurality of styluses, a rotary shaft for operating the styluses, an electromagnet mounted in adjacent relation to the said shaft, and an arm pivotally mounted upon the armature of said magnet and adapted to engage said shaft to stop the same.

21. In a facsimile-telegraph, a plurality of styluses, a rotary shaft for operating the styluses, spiral guide devices provided upon said shaft, an electromagnet mounted in adjacent relation to the said shaft, and an arm pivotally connected to the armature of said magnet in a plane at right angles to the vibratory plane of action thereof, said arm being adapted to engage the guide devices upon the shaft to stop the same.

22. In a facsimile-telegraph, a plurality of styluses, mechanism for operating the same, stop devices comprised in said mechanism, means for engaging said stop devices, means actuated by the actual writing impulses sent over the line, whereby to start or release the mechanism by said writing impulses and to stop the mechanism by the absence of said writing impulses, and means for prolonging the actual engagement of the operating means with the stop devices after the former is thrown into operative position, whereby the mechanism will not stop until after a continuous predetermined absence of writing impulses.

23. In a facsimile-telegraph, a plurality of styluses, mechanism for operating the styluses, stop devices comprised in said mechanism, vibratory operating devices adapted to engage said stop devices, and intermediate means arranged to be first engaged by said vibratory devices and adapted to guide the same to said stop devices in a prolonged period of movement.

24. In a facsimile-telegraph, a plurality of styluses, the combination of mechanism for operating the styluses, an electromagnet and its vibrating armature, means actuated by said armature for engaging and stopping the stylus-operating mechanism, and means for retarding the action of said mechanism in effecting said engagement.

25. In a facsimile-telegraph, a plurality of styluses, the combination of mechanism for operating the styluses, an electromagnet and its vibratory armature, mechanism operated by said armature and adapted to engage the stylus-operating mechanism to stop the same, and independent means for quickening or accelerating the disengaging movement of said stop mechanism.

26. In a facsimile-telegraph, a plurality of styluses, mechanism for operating the styluses, electrically-actuated mechanism comprised in an individual circuit and arranged in operative relation to said stylus-operating mechanism to stop the same, means for prolonging the action of said stop mechanism after it is thrown into operative position, and electrically-actuated mechanism comprised in the main transmitting or writing circuit and operating to open and close said individual circuit.

27. In a facsimile-telegraph, a plurality of styluses, mechanism for operating the styluses, an electromagnet comprised in an individual circuit and having its armature in connection with mechanism adapted to be brought into operative position to stop said stylus-operating mechanism, means for prolonging the action of said stop mechanism after it has been thrown into operative position by the vibratory movement of the armature, and a relay comprised in the main transmitting or writing circuit, and arranged in operative relation to said individual circuit to open and close the same.

28. In a facsimile-telegraph, a set of stylus devices arranged in a successive series, a commutator provided with two separate sets of individual segments, and circuit connections between said stylus devices and said segments, said connections extending alternately from the successive stylus devices to the different sets of segments and successively from the alternate stylus devices to the successive segments of the respective sets.

29. In a facsimile-telegraph, a set of stylus devices arranged in series, means whereby two different styluses will always be in operative contact with the message-paper, a commutator having separate sets of segments, said sets being made up of a series of separate segments and individual circuit connections extending from the respective stylus devices to such respective segments in such manner that each of the successively-contacting styluses will be connected to the same set of segments as the second stylus following it.

30. In a facsimile-telegraph, a set of constantly-rotating stylus devices, means for bringing a plurality of said stylus devices simultaneously in contact with the message-paper, and means for successively and individually circuiting said plurality of styluses.

31. In a facsimile-telegraph, a set of constantly-rotating electrically-actuated styluses, means for simultaneously bringing a plurality of said stylus devices into contact with the message-paper, and means for separately and individually actuating said plurality of stylus devices.

32. In a facsimile-telegraph, a plurality of stylus devices, the "selecting-commutator" device comprising separate sets of segments, the segments of each set being alternatively arranged and the segments of the different sets being in alternative relative position, and means for connecting said respective sets of segments with the individual stylus devices.

33. In a facsimile-telegraph, a plurality of stylus devices, the stylus-commutator divided into separate sets of individual segments which are individually connected to said stylus devices, in combination with the "selecting-commutator" divided into separate sets of alternatively-arranged segments with the segments of its different sets alternatively arranged in relative position, and the circuit connections between said commutators, for the purpose set forth.

34. In a facsimile-telegraph, a plurality of stylus devices, means for bringing a plurality of stylus devices simultaneously in contact with the message-paper, and means for alternating the action of said plurality of styluses while they are in said simultaneous contact.

35. In a facsimile-telegraph, a recording message-paper-feed mechanism, comprising a platen, a plurality of rollers mounted above said platen, a continuous carbon-ribbon mounted upon the said rollers and traversing the platen, a message-paper holder, guide devices for carrying the said paper over the platen in contact with the carbon-ribbon, means for adjusting the platen, means for regulating the tension of the carbon-ribbon, and means for tightening the guide devices upon the message-paper.

36. In a facsimile-telegraph, the combination, with the main frame of the machine having an opening, and stylus mechanism operating within said frame, of a carbon-ribbon-carrying frame mounted upon said main frame and embodying a table or platen arranged with relation to said stylus mechanism, said carbon ribbon-carrying frame being received within the opening of the main frame.

37. In a facsimile-telegraph, the combination of a recording paper-feed mechanism, a carbon-ribbon-feed mechanism, means for operating said ribbon and paper mechanisms in unison, and tension devices for tightening and adjusting the paper with relation to its unison movement with the ribbon.

38. In a facsimile-telegraph, a constantly-rotating stylus-carrier, carrying a series of transmitting stylus devices which successively pass over the message-blank, a corresponding series of recording stylus devices, circuit connection between said respective series of transmitting and recording stylus devices, means for maintaining a plurality of said transmitting stylus devices and recording stylus devices in operative correlative position at the same time; and means for commutating the said transmitting devices to the writing-circuit.

39. In a facsimile-telegraph, the combination with a pair of alternating generators, and a constantly-closed line-circuit connecting the same, of transmitting and recording facsimile-telegraph mechanisms respectively connected to the said generators to be thereby synchronously operated, the transmitting devices being comprised in an individual circuit which is alternately opened and closed during the transmission of the message; and means for causing the current of the said individual circuit to pass over the main line as message impulses.

40. In a facsimile-telegraph, the combination with a pair of alternating generators and a constantly-closed circuit connecting the same, of transmitting and recording facsimile-telegraph instruments connected respectively with the said generators to be synchronously operated thereby; the writing mechanism of the recording instrument being comprised in the line-circuit, and the transmitting devices being comprised in an individual short circuit which is connected with the line and normally separated therefrom; and means for opening the said individual short circuit when the transmitting writing devices transmit message impulses, whereby said impulses will be sent over the line.

41. In a facsimile-telegraph, the combination with a pair of alternating generators connected by a constantly-closed circuit, of transmitting and recording facsimile-telegraph instruments connected respectively with the said generators to be synchronously operated thereby, stylus devices comprised in the said instruments and thereby caused to travel over a message-paper; the recording-stylus devices being comprised in the main circuit; and the transmitting-stylus devices being comprised in an individual short circuit which is connected with the line, and which is completed when the stylus devices are in contact with the message-blank; and means for breaking the said individual short circuit when the stylus is in contact with the message matter to be transmitted, whereby such opening of the short circuit will send message impulses over the line.

42. In a facsimile-telegraph, the combination with a pair of alternating generators, and a constantly-closed line-circuit connecting the same, of transmitting and recording facsimile-telegraph mechanisms connected respectively with the said generators to be synchronously operated thereby, stylus devices comprised in the said instruments and thereby caused to travel over a message-paper; the recording-stylus devices being comprised in the main circuit and the transmitting-stylus devices being comprised in an individual circuit which is connected with the line but which contains an individual source of electrical energy, which source of energy is short-circuited from the line when the stylus devices are in contact with the message-blank, and the current of which is sent over the line when the stylus is in contact with the message matter to be transmitted.

43. In a facsimile-telegraph, a constantly-closed main circuit, including the operating mechanisms of the instruments, which circuit is operated by an alternating synchronizing-current; and an individual circuit comprising the transmitting devices and embodying a direct-current source of energy which is short-circuited from the main line when the instrument is not transmitting message matter, but which is sent over the line when the writing devices are transmitting message matter.

44. In a facsimile-telegraph means for synchronizing the instruments

with an alternating current over a constantly-closed main circuit and means for sending direct-current message impulses over the said circuit, at the same time with the synchronizing alternating current.

45. In a facsimile-telegraph means for synchronizing the instruments by a small or balanced alternating current over a constantly-closed main circuit, and sending heavier direct-current message impulses over the said closed circuit, at the same time with the synchronizing alternating current.

46. In a facsimile-telegraph means for synchronizing the instruments by an alternating current over a constantly-closed line-circuit in which the recording writing devices are included, an individual direct-current circuit, and means for sending the said direct current intermittently over the closed circuit including the transmitting devices as message impulses, at the same time with the synchronizing alternating current.

47. In a facsimile-telegraph means for maintaining a constantly-closed synchronizing-circuit in which the operating mechanisms of the instruments are included and in which the recording writing mechanism is also included, and an individual circuit including the transmitting devices the current of which is connected with and sent over the closed main circuit intermittently as message impulses.

48. In a facsimile-telegraph, the combination with a pair of alternating generators and a constantly-closed line-circuit connecting the same, of transmitting and recording facsimile-telegraph mechanisms respectively connected to the said generators to be thereby synchronously operated, the transmitting devices being comprised in an individual circuit which is intermittently opened and closed during the transmission of the message; means for causing the current of the said individual circuit to pass over the main line as message impulses when the transmitting writing devices are in contact with the message matter; means for stopping the transmitting devices when they are in contact with the message-blank; and means for suspending the action of the said stop means until the writing devices have traversed a predetermined amount of message-blank.

49. In a facsimile or other synchronous telegraph, a constantly-closed main circuit including the operating mechanism of the instruments and which circuit is operated by the alternately-synchronizing current; and an individual circuit comprising the actual transmitting devices and embodying a direct-current source of energy which is short-circuited from the main line when the instrument is not transmitting message matter, but which is sent over the line when message matter is being transmitted.

50. In a synchronous telegraph means for synchronizing the instruments with an alternating current over a constantly-closed main circuit, and means for sending direct-current impulses over the said circuit at the same time with the synchronizing alternating current.

51. In a facsimile-telegraph, the combination, with the line-circuit and the transmitting and recording machines, of mechanism for automatically stopping and starting said machines in unison, and means for operating said mechanism through the writing or message electrical impulses over the line-circuit.

52. In a facsimile-telegraph, the combination, with the line-circuit and the transmitting and recording machines, of electromagnet devices operating to automatically stop and start said machines in unison, and means for operating said electromagnets by the writing or message electrical impulses over the line-circuit.

53. In a facsimile-telegraph, transmitting-stylus mechanism, recording-stylus mechanism, a line-circuit connection between said mechanisms, synchronously-actuated motor mechanisms respectively operating the transmitting and recording stylus mechanisms and having a line-circuit connection, and electrically-actuated means controlling the starting and stopping of the transmitting and recording stylus mechanisms in unison and actuated by the message impulses over the line-circuit.

54. In a facsimile-telegraph, transmitting-stylus mechanism, recording-stylus mechanism, a line-circuit connection between said mechanisms, continuously-operating motor mechanisms for the respective transmitting and recording stylus mechanisms, said motor mechanisms having a line-circuit connection and being synchronously actuated, electrically-actuated means for stopping and releasing the respective transmitting and recording stylus mechanisms in unison independently of the continuously-operating motor mechanisms, and means for actuating said stop and releasing means by the message impulses.

55. In a facsimile-telegraph, the combination, with stylus-operating mechanism, of mechanism for stopping and releasing said stylus-operating mechanism, and means for operating said stop and release mechanisms automatically by the action of the writing or transmitting impulses of the line-writing circuit.

56. In a facsimile-telegraph, the combination with stylus mechanism, of an automatic electrically-actuated stop and release mechanism for the stylus mechanism, actuated only by the electrical writing or transmitting impulses of the line-writing circuit.

57. In a facsimile-telegraph, the combination of stylus mechanism, comprised in an electric circuit and adapted in its operation to send electrical impulses over the writing or transmitting line-circuit, and electrically-actuated mechanism automatically controlling the stopping of said stylus mechanism and in operative circuit connection with said writing or transmitting circuit, whereby said stop mechanism is operated by the writing or transmitting electrical impulses.

58. In a facsimile-telegraph, a unison synchronous stop mechanism for the transmitting and recording machines, comprised in an electric circuit and adapted to stop and release the stylus mechanism, said stop mechanisms being in circuit connection with the writing or transmitting line-circuit and operated by the writing or transmitting electrical impulses sent over said line-circuit, whereby message impulses will release the machine and the continuous absence of message impulses will stop the machine.

59. A facsimile-telegraph comprising a disk rotating on an axis carrying a series of transmitting-points, a platen mounted in a plane perpendicular to the axis, a transmitting paper-feed comprising a pair of rolls at the end of the platen and a roll above the platen geared therewith, substantially as described.

60. A facsimile-telegraph comprising a disk rotating on an axis, a set of recording-points on the disk, magnets for operating the recording-points, and a paper-feed in a plane perpendicular to the axis for cooperating with the points, substantially as described.

61. A facsimile-telegraph comprising a disk rotating on an axis, a set of recording-points on the disk, magnets for operating the recording-points, and a paper-feed in a plane perpendicular to the axis, having means for moving carbon-paper, and means for moving ordinary paper, each paper to coöperate with the points, substantially as described.

62. A facsimile-telegraph comprising a disk rotating on an axis, a set of recording-points on the disk, magnets for operating them, a feed for carbon-paper and a feed for ordinary paper for drawing the papers over a platen to coöperate with the points, substantially as described.

63. A facsimile-telegraph comprising a disk rotating on an axis, a set of recording-points on the disk, magnets having armatures for operating the recording-points, and a paper-feed in a plane perpendicular to the axis for coöperating with the points substantially as described.

64. A facsimile-telegraph comprising a disk rotating on an axis carrying a series of transmitting-points, a metallic platen in a plane perpendicular to the axis, a set of springs connected to a rod and means for turning the rod to press the springs against the platen for conveying current to the transmitting-paper, substantially as described.

65. A facsimile-telegraph comprising transmitting-points and receiving-points, each mounted to rotate about an axis, paper-feeds in planes perpendicular to these axes, a single main line connecting them, means for sending electrical currents of one kind for writing purposes and means for sending currents of another kind for synchronizing purposes.

66. A facsimile-telegraph comprising a disk mounted to rotate about an axis, a double series of transmitting-points thereon each controlling a single main line, a source of electrical energy and means for throwing this source to one or the other set of the points in rapid alternation, and thereby sending pulses corresponding to one or other series of transmitting-points onto the line.

67. A facsimile-telegraph comprising a rotating disk, a double series of transmitting-points thereon each controlling a single main line and a pair of brushes bearing on break-wheels having their insulations in a staggered relation for supplying current to one or other of the sets of points in rapid alternation.

68. A facsimile-telegraph comprising a rotating disk mounted to rotate about an axis, a double series of transmitting-points thereon, another disk mounted to rotate about an axis, a double series of recording-points thereon, a single main line, a source of energy at the transmitting-station, means for throwing the source respectively to one or other sets of transmitting-points in rapid alternation and means at the receiving-station for operating the sets of recording-points alternating in synchronism therewith.

69. A facsimile-telegraph comprising a disk mounted to rotate about an axis, a double series of transmitting-points thereon, two commutators having their plates connecting respectively to the two sets of points, brushes bearing on these commutators connecting to other brushes bearing on break-wheels having their insulations in a staggered relation, and an electrical connection from the break-wheels to the transmitting-points completing the circuit.

70. A facsimile-telegraph comprising transmitting-points and receiving-points each mounted to rotate about an axis, paper-feeds in planes perpendicular to these axes, a single main line connecting them, an electric motor for driving the respective points, means for sending electrical currents of one kind for writing purposes and means for sending electrical currents of another kind for synchronizing the motor.

71. A facsimile-telegraph comprising transmitting and receiving points, each mounted to rotate about an axis, paper-feeds in planes perpendicular to these axes, a single main line connecting them, a unison de-

vice controlled by an electromagnet, a local circuit, for this magnet, a high-resistance relay controlling the local circuit, and means for sending a prolonged high-tension current over the line to operate this relay to bring the transmitter and receiver into unison.

72. A facsimile-telegraph comprising a disk rotating on an axis, a double series of receiving-points mounted on said disk, operating means for said receiving-points, two commutators connected symmetrically to the said operating means, a double series of transmitting-points, two commutators connected symmetrically to said series of transmitting-points paper-feeds in planes perpendicular to the two series of points and coöperating respectively therewith, a single main line, and means for throwing either one or other series of points into coöperative relation with the line in rapid alternation.

73. A facsimile-telegraph comprising a disk rotating on an axis, a series of receiving-points mounted on said disk, operating means for said receiving-points, a commutator on the axis connected to the means for operating the receiving-points, a series of transmitting-points, a commutator connected to the transmitting-points and paper-feeds in planes perpendicular to the two series of points for coöperating respectively therewith.

709,159. ORTHO-SULFONATED TOLUYLIC ALDEHYDE AND PROCESS OF MAKING SAME. JOSEPH KOETSCHET, St. Fons, near Lyons, France, assignor to Société Chimique des Usines du Rhône, anciennement Gillard, P. Monnet et Cartier, Lyons, France, a Corporation of France. Filed June 14, 1901. Serial No. 65,042. (No specimens.)

Claims.—1. The manufacture of ortho-sulfonated meta-toluylic aldehyde by reacting upon meta-toluylic aldehyde with sulfonating agents.

2. The manufacture of ortho-sulfonated meta-toluylic aldehyde by reacting upon meta-toluylic aldehyde with sulfuric acid containing sixty per cent. anhydride at a relatively low temperature.

3. As a new article of manufacture, ortho-sulfonated toluylic aldehyde obtained by the sulfonation of meta-toluylic aldehyde and having the composition $C_8H_8SO_4$, being an acid crystalline substance very soluble in water and combining with alkalies or alkali earths to form neutral salts also soluble in water and which when the sodium salt is acted upon by phosphorous pentachlorid affords a chlorin derivative insoluble in water, which derivative can be recrystallized from alcohol and melts at about 109° centigrade.

709,160. GREEN DYE AND PROCESS OF MAKING SAME. JOSEPH KOETSCHET, St. Fons, near Lyons, France, assignor to Société Chimique des Usines du Rhône, anciennement Gillard, P. Monnet et Cartier, Lyons, France, a Corporation of France. Filed June 18, 1901. Serial No. 65,050. (No specimens.)

Claims.—1. The manufacture of a coloring-matter by condensing ortho-sulfo-meta-toluylic aldehyde with an aromatic amin and oxidizing the leuco product.

2. The manufacture of a coloring-matter by condensing ortho-sulfo-meta-toluylic aldehyde with a substituted aromatic amin and oxidizing the leuco product.

3. The manufacture of a coloring-matter by condensing ortho-sulfo-meta-toluylic aldehyde with an alkylated aromatic amin and oxidizing the leuco product.

4. The manufacture of a coloring-matter by condensing ortho-sulfo-meta-toluylic aldehyde with a dimethylated aromatic amin and oxidizing the leuco product.

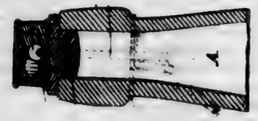
5. The manufacture of a coloring-matter by condensing ortho-sulfo-meta-toluylic aldehyde with dimethyl anilin and oxidizing the leuco product.

6. As a new product, a coloring-matter being the oxidized leuco condensation product of one molecule of ortho-sulfo-meta-toluylic aldehyde and two molecules of aromatic amin, and having the composition $C_7H_6(SO_3H)COH(X)_2$, where X indicates an aromatic amin radical, and which coloring-matter is soluble in water and dyes wool and silk bright-green to greenish-blue shades fast to alkalies.

7. As a new product, a coloring-matter being the oxidized leuco condensation product of one molecule of ortho-sulfo-meta-toluylic aldehyde and two molecules of a substituted aromatic amin, and having the composition $C_7H_6(SO_3H)COH(X)_2$ where X indicates a substituted aromatic amin radical, and which coloring-matter is soluble in water and dyes wool and silk bright-green to greenish-blue shades fast to alkalies.

709,161. BOTTLE-STOPPER. ISAIAH KOSCHERAK, New York, N. Y. Filed Jan. 16, 1902. Serial No. 90,622. (No model.)

Claim.—1. The combination, with a bottle-neck provided with a wire neck-band, of a U-shaped lever, a bail or yoke, a stopper the head of which is provided with a recess and a transverse groove in the inner end of said recess, and a sheet-metal cap fitting over the head of the stopper and provided with recesses at diametrically opposite points for the bail or yoke, substantially as set forth.



2. The combination, with a bottle-neck provided with a wire neck-band, of a U-shaped lever, a bail or yoke, a stopper having its head provided with a recess extending inwardly from one side and terminating in a diametrical groove, and a sheet-metal cap fitting over said head and provided with a fillet at its upper edge and upwardly-extending recesses at diametrically opposite points, substantially as set forth.

709,162. BOTTLE-STOPPER. ISAIAH KOSCHERAK, New York, N. Y. Filed Jan. 29, 1902. Serial No. 91,737. (No model.)

Claim.—1. In a bottle-stopper, a porcelain head or knob, the shank of which is provided with an elastic gasket, and a metallic covering-cap applied to the lower shouldered end of the head or knob, said cap having a rim tightly secured against the lower portion of the gasket, substantially as set forth.

2. In a bottle-stopper, a porcelain head or knob, provided with a rubber gasket, and a sheet-metal covering-cap at the shouldered lower end of the head, said covering-cap being provided with an outwardly-flaring rim fitting tightly around the gasket, so as to retain the same firmly in position on the head, substantially as set forth.

709,168. BOWLING-ALLEY. HENRY B. LAMB, New York, N. Y., assignor of one-half to Bowling Ball Company, New York, N. Y., a Corporation of New York. Filed Jan. 27, 1902. Serial No. 91,322. (No model.)

Claim.—1. In a bowling-alley, a runway extending lengthwise of the alley and having an inclined portion at its rear end and a separate transverse runway extending across the alley, arranged to permit the ball to drop therefrom onto the incline of the longitudinal runway, substantially as set forth.

2. In a bowling-alley, a runway extending lengthwise of the alley and having an inclined portion at its rear end and a substantially hori-

zontal portion leading therefrom to its front end and a separate transverse runway located across the rear end of the alley and arranged to permit the ball to drop therefrom onto the inclined portion of the longitudinal runway, substantially as set forth.

3. In a bowling-alley, a runway extending lengthwise of the alley and having an inclined portion at its rear end, a separate transverse runway located across the rear end of the alley and arranged to permit the ball to drop therefrom onto the inclined portion of the longitudinal runway and a stop arranged in position to cause the ball to drop onto the said longitudinal runway, substantially as set forth.

4. In a bowling-alley, a longitudinal runway, a branch runway leading laterally therefrom at the front end of the alley and a separate transverse runway located across the rear end of the alley and arranged to permit the ball to drop therefrom onto the longitudinal runway, substantially as set forth.

709,164. **ASEPTIC SPUTUM-RECEPTACLE AND HOLDER.** CATHERINE M. LAUGHLIN, Philadelphia, N. J. Filed June 27, 1901. Serial No. 66,215. (No model.)

Claim.—1. A sputum-holder composed of a bag formed from a sheet of flexible waterproof material and provided with means for securing it to a garment, the top of the bag being provided at the back with a closing-flap and at the front with a button-stud with which said flap may be connected, and an upper flap portion formed by an extension of the front top portion of the bag and adapted to be turned backwardly and downwardly into the bag, substantially as shown and described.

2. In a device of the class described, the combination with a bag formed of flexible waterproofed material provided with flaps 19 and 19' and with securing-tangs 16 and 17, of a securing button or stud carried by the same adapted to receive and secure in place the flap 19, an outer pocket or bag carried by the first-mentioned bag, and adapted to receive a plurality of sputum-receptacles, substantially as shown and described.

709,165. **CUSPIDOR.** ALEXANDER LINDSAY, Wellsville, Ohio. Filed Dec. 7, 1901. Serial No. 85,044. (No model.)

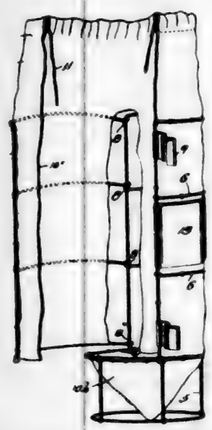
Claim.—1. A cuspidor comprising a bowl having a receiver arranged thereon, the upper end of which projects above the said bowl and having its lower end contracted and slotted, the said lower end terminating in a flaring portion arranged below the said slots, substantially as shown and described.

2. A cuspidor comprising a bowl having a funnel-shaped receiver fixed thereon, the lower edge of which is open and having slots radiating from the said open end, and an inverted-funnel-shaped section projecting from the lower end of the receiver and formed integral therewith, the said section being arranged within the bowl, substantially as shown and described.

709,166. **BANANA-SHIPPING CRATE.** NICHOLS LOMBARDO, Mason City, Iowa. Filed Mar. 17, 1902. Serial No. 98,579. (No model.)

Claim.—1. In a shipping-crate, a framework supported at one end, and consisting of two semicylindrical sections removably united longitudinally, a fabric envelop inclosed by said framework and having foldable ends and divided longitudinally, substantially as described.

2. In a shipping-crate, a framework formed of two semicylindrical sections removably united longitudinally, a fabric envelop inclosed by said sections and with foldable ends and divided longitudinally and with a longitudinal flap covering said division, substantially as described.



3. In a shipping-crate, a frame formed of a cylindrical end portion adapted to receive a portion of the contents and having a semicylindrical extension, and a semicylindrical portion removably engaging said cylindrical portion and semicylindrical extension, substantially as described.

4. In a shipping-crate, a framework formed of a cylindrical end portion adapted to receive a portion of the contents and having a semicylindrical extension, and a semicylindrical portion removably engaging said cylindrical portion and semicylindrical extension, and a fabric envelop inclosed by said framework, substantially as described.

5. In a shipping-crate, a frame formed of a cylindrical end portion having a semicylindrical extension, and a semicylindrical portion removably engaging said cylindrical portion and said semicylindrical extension, a fabric envelop inclosed by said framework with a conical extension at one end and foldable at the other end, substantially as described.

6. In a shipping-crate, a framework formed of a cylindrical end portion having a semicylindrical extension, and a semicylindrical portion engaging said cylindrical portion and semicylindrical extension, a fabric envelop inclosed by said framework having a longitudinal division on one side and provided with a flap adapted to form a closure to said division, substantially as described.

7. In a shipping-crate, a framework formed of a cylindrical end portion adapted to receive a portion of the contents and having a semicylindrical extension and a semicylindrical portion engaging said cylindrical portion and semicylindrical portion by a hinged joint on one side and yieldable catches on the other side, substantially as described.

8. In a shipping-crate, a framework formed of a cylindrical end portion having a semicylindrical extension and a semicylindrical portion removably engaging said cylindrical portion and semicylindrical extension, and a fabric envelop inclosed by said framework and having a conical extension at one end and foldable at the other end and with a longitudinal division between said ends, substantially as described.

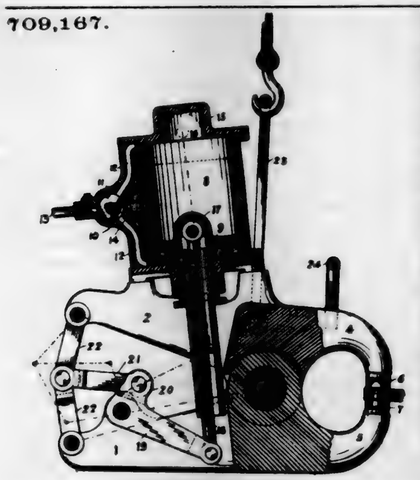
9. In a shipping-crate a framework formed of two semicylindrical sections longitudinally united, a fabric envelop inclosed by said framework, and a name-plate upon said framework secured by bending the edges of said plate upon adjacent wires of the framework thereby bracing the latter, substantially as described.

709,167. **RIVETING-MACHINE.** GEORGE E. MARTIN, Philadelphia, Pa., assignor to the Pedrick and Ayer Company, Philadelphia, Pa. Filed Dec. 21, 1901. Serial No. 86,732. (No model.)

Claim.—1. In combination with the vibrating arms of a riveting-machine, a power cylinder and piston located upon one arm thereof and a bell-crank lever mounted upon the opposite arm, the long arm of the lever connecting with the power-piston rod and the short arm with a toggle-lever mechanism for vibrating the arms as set forth.

2. In combination with the vibrating arms of a riveting-machine, a power cylinder and piston located at an inclination to the axis of the movement of said arms, a bell-crank lever having its long arm connected to the power-piston rod, and its short arm with a toggle-lever device connected to the respective riveting-arms for vibrating the same, as set forth.

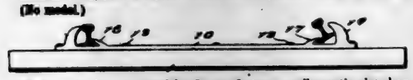
709,167.



709,168. **TROLLEY.** FRANK A. MERRICK, Johnstown, Pa., assignor, by mesne assignments, to Westinghouse Electric and Manufacturing Company, Pittsburg, Pa., a Corporation of Pennsylvania. Original application filed Sept. 14, 1899, Serial No. 730,437. Divided and this application filed Dec. 30, 1899. Serial No. 742,127. (No model.)

Claim.—The combination with a trolley harp and a wheel journaled therein, of an upwardly-pressing spring-arm secured to the harp within the fork thereof, and a contact-shoe at the upper end of said arm fitted to and contacting with the under side of the laterally-extending hub of said wheel, said shoe having an elongated longitudinal bearing on said hub, between the dished face of the wheel and the fork-arm, and guarded by its position from the action of stray arcs.

709,169. **RAILROAD-TIE PLATE.** THOMAS R. MOODIE and WILLIAM H. BUHL, Hartland, Me. Filed June 27, 1902. Serial No. 113,446. (No model.)



Claim.—1. As a new article of manufacture, a railway-tie plate having clips conforming to and adapted to engage the adjacent edges of the tie-flanges of the opposite rails, and with longer clips adapted to engage the outer edges of the heads of the opposite rails relatively near their upper surfaces, substantially as described.

2. As a new article of manufacture, a railway-tie plate having clips conforming to and adapted to engage the adjacent edges of the tie-flanges of the opposite rails, and with longer clips adapted to engage the outer sides of the heads of the opposite rails relatively near their upper surfaces, said longer clips curving outwardly between their extremities, whereby means are provided for the insertion and removal of the rails, substantially as described.

3. As a new article of manufacture, a railway-tie plate provided with clips conforming to and adapted to engage the adjacent edges of the tie-flanges and the vertical webs of the opposite rails, and with longer clips adapted to engage the outer sides of the heads of the opposite rails relatively near their upper surfaces, substantially as described.

4. As a new article of manufacture, a railway-tie plate having a clip conforming to and adapted to engage the inner edge of the tie-flange of the rail, and with a longer clip adapted to engage the outer side of the head of the rail relatively near its upper surface, substantially as described.

5. As a new article of manufacture, a railway-tie plate having a clip conforming to and adapted to engage the inner edge of the tie-flange and the vertical web of the rail, and with a longer clip adapted to engage the outer side of the head of the rail relatively near its upper surface, substantially as described.

6. As a new article of manufacture, a railway-tie plate having a clip conforming to and adapted to engage the inner edge of the tie-flange, and with a longer clip adapted to engage the outer side of the head of the rail relatively near its upper surface, said longer clip curving outwardly between its extremities, whereby means are provided for the insertion and removal of the rail, substantially as described.

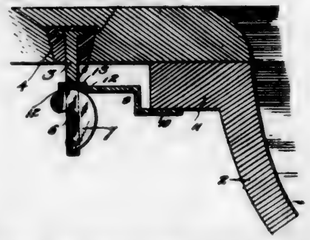
7. As a new article of manufacture, a railway-tie plate having clips conforming to and adapted to engage the adjacent edges of the tie-flanges of the opposite rails, and with longer clips adapted to engage the outer edges of the heads of the opposite rails relatively near their upper surfaces, a supporting-tie beneath said plate, and means for securing said plate to said tie, substantially as described.

8. In railway construction, the rails spaced apart and connected at their adjacent ends by railway-rail joints, spaced ties transversely connecting said rails, tie-plates engaging the under sides of said rails transversely and adjacent to said joints, said tie-plates having clips conforming to and adapted to engage the adjacent edges of the tie-flanges of said rails, and with longer clips adapted to engage the outer sides of the heads of the opposite rails relatively near their upper surfaces, substantially as described.

9. As a new article of manufacture, a railway-tie plate having a clip integral therewith and conforming to and adapted to engage the inner edge of the tie-flange of the rail, and with a longer clip integral therewith and adapted to engage the outer side of the head of the rail relatively near its upper surface, substantially as described.

10. The combination of a railway-tie, spaced rails transversely engaging said tie, clips extending above said tie and conforming to and adapted to engage the inner edges of the tie-flanges of the rails, and clips extending above said ties and adapted to engage the outer surfaces of the heads of the rails, substantially as described.

709,170. **BASIN-CLAMP.** JOHN O. NOBLE, Trenton, N. J. Filed Mar. 3, 1902. Serial No. 96,451. (No model.)



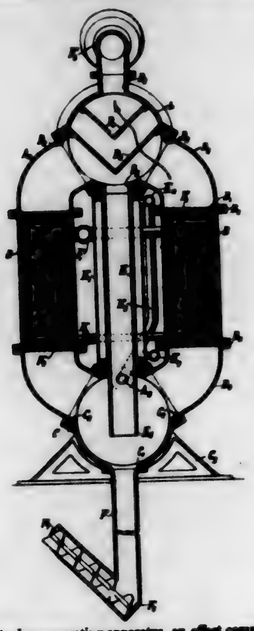
Claim.—A basin-clamp comprising a slotted post adapted to be secured to the slab or shelf of a basin, a cam-lever pivoted in the lower end of the post and adapted to swing into said slot, and a clamping-jaw having an aperture through which the post projects and a groove formed in its lower side contiguous to said aperture to receive the edge of the cam-lever and lock the clamping-jaw against rotation upon the post, substantially as set forth.

709,171. **FOLDING TABLE.** WILLIAM O. NUSBAUMER, Sheboygan, Wis. Filed Apr. 3, 1902. Serial No. 101,262. (No model.)

Claim.—A table of the kind described, comprising in combination a post or standard slotted at its upper and lower ends, the detachable legs adapted to fit into the slots at the lower end of the post or standard, the detachable supporting-arms adapted to fit into the slots at the upper end of the post or standard, the top or cover comprising the central piece, and the side pieces or leaves hinged thereto, said leaves or side pieces

having a depending valance or cornice, loops or bails carried by the said side pieces upon their under face, the angular locking-plates carried by the supporting-arms, and a spring-catch secured to the under side of the top piece and adjacent to one of the loops, said catch being adapted to permit one of the arms to pass beneath it in the direction of the loop, but resisting movement of the top piece or arm relative to each other in the opposite direction, substantially as described.

709,172. VACUUM EVAPORATING APPARATUS. CHARLES CONWAY, Brooklyn, N. Y. Filed Dec. 4, 1901. Serial No. 84,611. (No model.)



Claim.—1. In evaporating apparatus, an effect comprising a series of similar sections each of said sections being provided with flanges to readily assemble the same to form said effect, each of said sections comprising a vapor-chamber, a liquor-chamber, a vertical downtake connecting said vapor-chamber and said liquor-chamber and extending nearly to the bottom of said liquor-chamber, two batteries of vertical heating-tubes arranged adjacent said downtake on either side of the same, flanged connections connecting said heating-tubes with said vapor-chamber and said liquor-chamber to enable said heating-tubes to be readily removed from said chambers, a vacuum-leg connected with said liquor-chamber substantially in line with said downtake, a boot at the lower end of said vacuum-leg, a screw conveyer communicating with said boot, said liquor-chamber being formed adjacent said vacuum-leg with a flared hole to direct material into said vacuum-leg, a jacket surrounding said downtake and connections to feed the liquor into said jacket to cool said downtake and to feed said liquor from said jacket into said liquor-chamber.

2. In evaporating apparatus, a sectional effect comprising a series of similar sections bolted together by connecting-flanges formed on said sections, each one of said sections comprising a vapor-chamber, a liquor-chamber, a vertical downtake connecting said vapor chamber and said liquor-chamber and two batteries of heating-tubes arranged on either side of said downtake and connected to said liquor-chamber and said vapor-chamber to form a sectional effect which may be readily varied in capacity by varying the number of sections in said effect.

3. In evaporating apparatus, an effect comprising a series of similar sections provided with flanges to readily assemble said sections, each of said sections comprising a vapor-chamber having baffle-plates, a liquor-chamber and a vertical downtake connecting said vapor-chamber with said liquor-chamber and extending nearly to the bottom of said liquor-chamber, batteries of tubes mounted adjacent said downtake and connected to said liquor-chamber and said vapor-chamber, said sections when assembled having the liquor-chambers and vapor-chambers in communication to form common liquor and vaper chambers.

4. In evaporating apparatus, an effect comprising a series of similar sections, said sections being provided with opposing flanges on the vapor and liquor chambers of said sections to be bolted together to readily connect said sections together, each of said sections comprising a vapor-chamber, a liquor-chamber, a vertical downtake connecting said chambers and two batteries of heating-tubes arranged on either side of said downtake and connected to said liquor-chamber and said vaper-chamber.

5. In evaporating apparatus, an effect comprising a series of similar sections, said sections being provided with opposing flanges on the vaper and liquor chambers of said sections to be bolted together to readily connect said sections and form an effect having a common vaper and liquor chamber extending the whole length of the same, each of said sections comprising a vapor-chamber having baffle-plates arranged therein, a liquor-chamber, a vertical downtake connecting said chambers and two batteries of heating-tubes arranged on either side of said downtake and connected to said liquor-chamber and said vapor-chamber.

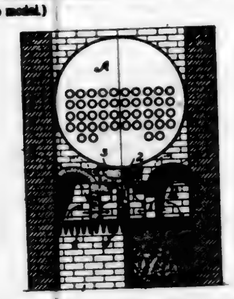
6. In evaporating apparatus, an effect comprising a vapor-chamber, a liquor-chamber provided with a vacuum-leg, a vertical downtake connecting said vapor-chamber and said liquor-chamber and extending nearly to the bottom of said liquor-chamber and substantially in line with said vacuum-leg, batteries of heating-tubes connected to said liquor-chamber and said vapor-chamber, a jacket surrounding said downtake and connections by which liquor fed to said effect enters said jacket to cool the liquor in said downtake and is fed from said jacket into said liquor-chamber.

7. In evaporating apparatus, an effect comprising a vapor-chamber, a liquor-chamber, a vertical downtake connecting said vapor-chamber and said liquor-chamber and extending nearly to the bottom of said liquor-chamber, batteries of vertical heating-tubes arranged adjacent said downtake and communicating with said vapor-chamber and said liquor-chamber, a vacuum-leg connected to said liquor-chamber and substantially in line with said downtake, means to remove material from said vacuum-leg, a jacket surrounding said downtake and means to secure a circulation of fluid in said jacket to cool said downtake.

8. In evaporating apparatus, an effect comprising a vapor-chamber, a liquor-chamber, batteries of heating-tubes communicating with said vapor-chamber and said liquor-chamber, a vertical downtake communicating with said vapor-chamber and said liquor-chamber, a jacket around said downtake, means to supply fluid to said jacket to cool the liquor in said downtake and means to remove precipitated material from said liquor-chamber.

9. In evaporating apparatus, an effect comprising a vapor-chamber, a liquor-chamber, heating-tubes connected to said vapor-chamber and said liquor-chamber, a downtake connected to said vapor-chamber and said liquor-chamber, a jacket surrounding said downtake and means to cause a circulation of fluid in said jacket to cool said downtake.

709,173. STEAM-BOILER FURNACE. ORIL D. ORVIS, New York, N. Y. Filed Mar. 11, 1901. Renewed July 29, 1902. Serial No. 117,532. (No model.)



Claim.—1. In a furnace, the combination with the fire-chamber and the grate, of retorts located beyond the grate opening into the fire-chamber above the grate and provided with lateral apertures for the discharge of the products of combustion, and a longitudinal wall intermediate of said retorts and having apertures corresponding with those of the retorts, substantially as described.

2. In a furnace, the combination with the fire-chamber and the grate, of retorts located beyond the grate opening into the fire-chamber above the grate and provided with lateral apertures for the discharge of the products of combustion, and a longitudinal wall intermediate of said retorts and having apertures corresponding with those of the retorts but located at a higher level, substantially as described.

3. In a steam-boiler furnace, the combination with the fire-chamber and the grate, of retorts located beyond the grate opening into the fire-chamber above the grate and provided with lateral apertures for the discharge of the products of combustion, a longitudinal wall intermediate of said retorts and having apertures corresponding with those of the retorts, and a rear wall located within the combustion-chamber and provided with a passage or passages arranged in proximity to the boiler, substantially as described.

4. In a steam-boiler furnace, the combination with the fire-chamber and the grate, of retorts located beyond the grate opening into the fire-chamber above the grate and provided with lateral apertures for the discharge of the products of combustion, a longitudinal wall intermediate of said retorts and having apertures corresponding with those of the retorts, and a rear wall located within the combustion-chamber and provided with a passage or passages arranged concentric with the boiler in proximity to the same, substantially as described.

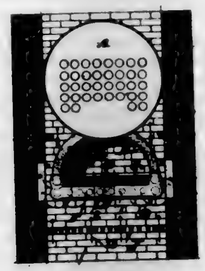
5. In a steam-boiler furnace, the combination with the fire-chamber and the grate, of retorts located beyond the grate opening into the fire-chamber above the grate and provided with lateral apertures for the discharge of the products of combustion, a longitudinal wall intermediate of said retorts and having apertures corresponding with those of the retorts, a rear wall located within the combustion-chamber and provided with a passage or passages arranged in proximity to the boiler, and means extending through said wall for introducing air to the combustion-chamber, substantially as described.

6. In a steam-boiler furnace, the combination with the fire-chamber and the grate, of retorts located beyond the grate opening into the fire-chamber above the grate and provided with lateral apertures for the discharge of the products of combustion, and a longitudinal wall intermediate of said retorts having apertures corresponding with those of the retorts and provided with a deflecting-head in proximity to the bottom of the boiler, substantially as described.

7. In a steam-boiler furnace, the combination with the fire-chamber and the grate, of retorts located beyond the grate opening into the fire-chamber above the grate and provided with lateral apertures for the discharge of the products of combustion, and a longitudinal wall intermediate of said retorts having apertures corresponding with those of the retorts and provided with a deflecting-head or deflector in proximity to the bottom of the boiler; and said retorts being provided with inwardly-projecting deflectors above their lateral apertures, substantially as described.

8. In a steam-boiler furnace, the combination with the fire-chamber and the grate, of retorts located beyond the grate opening into the fire-chamber above the grate and provided with lateral apertures for the discharge of the products of combustion, a longitudinal wall intermediate of said retorts and having apertures corresponding with those of the retorts, a rear wall located within the combustion-chamber and provided with a passage or passages arranged in proximity to the boiler, and with a cleaning-opening, substantially as described.

709,174. COMBINATION DRAFT-FURNACE. ORIL D. ORVIS, New York, N. Y. Filed May 13, 1901. Renewed July 29, 1902. Serial No. 117,534. (No model.)



Claim.—1. In a combination draft-furnace, the combination with a water-grate, of a fire-chamber located above said grate and including part of the boiler-surface, and means for establishing a circulation of water through the grate; said grate having lateral exits for the products of combustion, downward exits for the products of combustion, and rear exits for the products of combustion; all said parts being arranged to cause a commingling of the gases, substantially as described.

2. In a combination draft-furnace, the combination with a water-grate, of a fire-chamber located above said grate and including part of the boiler-surface, and means for establishing a circulation of water through the grate; said grate having lateral exits for the products of combustion,

downward exits for the products of combustion, rear exits for the products of combustion, a lower grate adapted to receive the droppings from the first grate, and a rear and upward exit for the products of combustion from said grate; all said parts being arranged to cause a commingling of the gases from the water-grate and the lower grate, substantially as described.

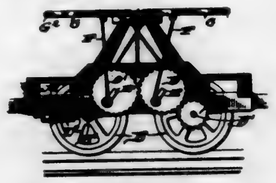
3. In a combination draft-furnace, the combination with a water-grate, of a fire-chamber located above said grate, and means for establishing a circulation of water through the grate; said grate having lateral exits for the products of combustion, downward exits for the products of combustion, and rear exits for the products of combustion; all said parts being arranged to cause a commingling of the gases, substantially as described.

4. In a combination draft-furnace, the combination with a water-grate, of a fire-chamber located above said grate, and means for establishing a circulation of water through the grate; said grate having lateral exits for the products of combustion, downward exits for the products of combustion, rear exits for the products of combustion, a lower grate adapted to receive the droppings from the first grate, and a rear and upward exit for the products of combustion from said grate; all said parts being arranged to cause a commingling of the gases from the water-grate and the lower grate, substantially as described.

5. In a furnace, the combination with a fire-chamber having a water-grate, of converging arches extending from said grate and abutting against the boiler and exposing part of the boiler to radiant heat, combined with means for establishing a circulation of water through the grate, a lower grate adapted to receive the droppings from the first grate, a bridge-wall, and a wall closing the rear of the arches, all arranged to cause a commingling of the gases from the water-grate and the lower grate between the arches and the bridge-wall, substantially as described.

6. In a furnace, the combination with a fire-chamber having a water-grate opening laterally and furnace-walls having formed therein on each side of and adjacent to the grate a series of combustion-chambers into which the products of combustion from the grate pass in their rearward passage under the influence of the draft, substantially as described.

709,175. HAND-CAR. JOHN R. ROACH, Oaks, Ind. Filed June 14, 1902. Serial No. 111,740. (No model.)



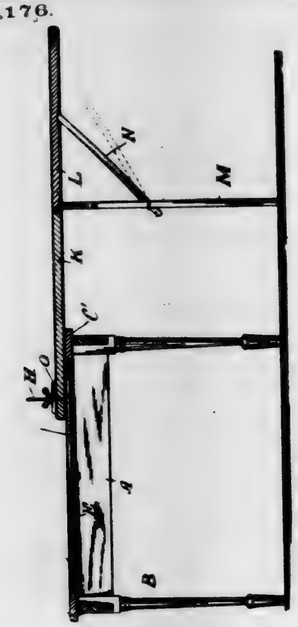
Claim.—1. In a hand-car the combination with the main frame, wheels and axles, said main frame having a central opening, of the crank-shafts arranged in said opening, the gears mounted upon said crank-shafts and meshing with each other, a gear mounted upon one of the axles and meshing with one of the gears mounted upon the crank-shaft, the supporting-frames arranged upon opposite sides of the central opening and main frame, and hand-levers pivotally mounted upon said supporting-frames, and the pitmen pivotally connecting the said levers with their respective crank-shafts, substantially as specified.

2. In a hand-car, the combination with a suitable platform cut away in the center, a frame above said central opening, levers bifurcated at both ends, cross-pieces terminating in trunnions secured in the bifurcated portions of the inner ends of the levers, said cross-pieces being journaled in the frame, hand-bars secured in the outer bifurcated ends of the levers, downwardly-projecting lugs secured to each lever adjacent the inner bifurcated portion, shafts mounted below said central opening having crooked portions, pitman-rods pivoted between the lugs and connected to the ends of the shafts respectively, and means for communicating the motion of said rods, and shafts to the car.

709,176. COMBINATION TABLE AND IRONING BOARD. PHILIPP ROTHENBERGER, New York, N. Y., assignor to Frederick Ruth, New York, N. Y. Filed Nov. 27, 1901. Serial No. 83,986. (No model.)

Claim.—The combination of a table having a portion of its top revolvable, a folding ironing-board attached by a sliding axis to the revolvable portion of the table-top, and a folding supporting-leg attached to the board, said folding portions being capable in their extended positions of horizontal motion about the sliding axis, substantially as described.

709,176.



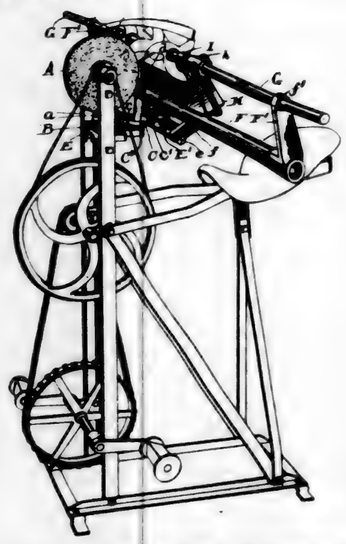
said notch and adapted to hold said guide in any desired position with reference to said arm; substantially as described.

4. In a device of the class described, the combination with a suitable supporting-arm, of a guide consisting of a flat plate, a notched rearwardly-extending lug and two forwardly-projecting lugs upon the edges of said flattened plate, said lugs also forming semicircular projections from one end of said flattened plate and suitable means for adjustably supporting said guide upon said supporting-arm; substantially as described.

5. In a device of the class described, the combination with a supporting-arm, of a guide consisting of a flat plate, two forwardly-projecting lugs upon the edges of said plate, said lugs also forming curved projections on one end of said plate, and means for adjusting the position of said guide, substantially as described.

6. In a device of the class described, the combination with a suitable supporting-arm, of a guide consisting of a flat plate, two forwardly-projecting lugs upon the edges of said plate, means for angularly adjusting said guide upon said arm, and means for permitting said guide to be moved in all directions, substantially as described.

709,178. TOOL HOLDER AND GUIDE FOR GRINDSTONES. SILAS C. SCHOFIELD, Freeport, Ill. Filed Jan. 30, 1902. Serial No. 91,534. (No model.)



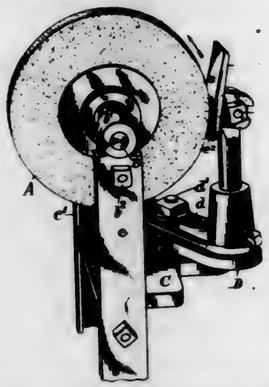
Claim.—1. The combination with a suitable grindstone and frame, of a frame pivotally connected to the supporting-frame of said grindstone, a suitable longitudinally-movable yoked shaft journaled in said frame, suitable means for supporting a lawn-mower cutter within said yoke in line with said shaft, and a suitable tool-guide adapted to fix the position of the blades of said cutter with reference to said grindstone; substantially as described.

2. In a device of the class described, the combination with a suitably-journaled, pivotally-swung frame, of two shafts, G, journaled in said frame, a yoke spanning the gap between the inner ends of said shafts, suitable means for adjusting space between the inner ends of said shafts and suitable means for holding an ordinary lawn-mower cutter in place between the inner ends of said shafts; substantially as described.

3. In a device of the class described, the combination with two shafts arranged in line and having a gap between them, of removable conically-socketed caps adapted to fit over the ends of said shafts and center a third shaft; substantially as described.

4. A tool guide and holder consisting of the plate, E, adapted to be clamped to the supporting-base of a grindstone, a tool-guide proper adapted to be adjustably clamped with reference to said grindstone, a frame pivotally connected to said plate, E, said frame consisting of a bar, F, upright journaled arms, F', thereon, two shafts, G, supported by said arms and having a gap between their inner ends, and a yoke, H, spanning said gap, and means for supporting a lawn-mower cutter between the inner ends of said shafts; substantially as described.

709,177. TOOL-GUIDE FOR GRINDSTONES. SILAS C. SCHOFIELD, Freeport, Ill. Filed Jan. 30, 1902. Serial No. 91,533. (No model.)

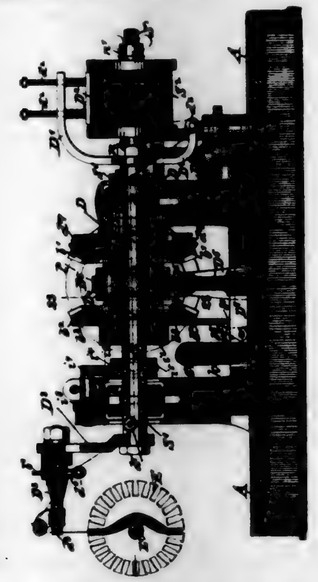


Claim.—1. In a device of the class described, the combination with a suitable supporting-arm, of a guide consisting of a flat plate supported by said arm, means for angularly adjusting said flat plate upon said arm, and means for altering the position of said guide in all directions, substantially as described.

2. In a device of the class described, the combination with a suitable supporting-arm, of a guide consisting of a flat plate, two forwardly-projecting lugs upon the edges of said plate and means for adjusting the position of said guide, substantially as described.

3. In a device of the class described, the combination with a slotted base and a grindstone rotatably journaled above the same, of a slotted plate upon said base, a bolt passing through the slots in said plate and said base, an arm extending upward from said plate, a flattened upper portion to said arm, a guide having a notched rearwardly-extending lug, and a suitable clamping-bolt passing through said flattened portion and

709,179. MACHINE FOR WINDING DRUM-ARMATURES. HENRY SCHULS, New York, N. Y. Filed Sept. 17, 1900. Renewed Feb. 20, 1902. Serial No. 94,924. (No model.)



Claim.—1. The combination, with means for supporting an armature-core, of a winding-crank, means for feeding the coil-forming wire to said crank, and means for rotating said crank, substantially as set forth.

2. The combination, with means for supporting an armature-core, of a winding-crank supported at right angles to the shaft of an armature-core supported by said means, means for rotating said winding-crank so that its end moves in a vertical longitudinal plane around the armature-core, and means for feeding the coil-forming wire from the crank to the core, substantially as set forth.

3. The combination, with means for intermittently rotating an armature-core on its axis, of a rotary winding-crank, and means for feeding the coil-forming wire to said crank, substantially as set forth.

4. The combination, with means for intermittently rotating an armature-core on its axis, of a rotary winding-crank, means for feeding the coil-forming wire to said crank, and mechanism for reciprocating the winding-crank twice for each rotation of the crank for clearing the shaft of the armature-core, substantially as set forth.

5. The combination, with means for intermittently rotating an armature-core on its axis, of a rotary winding-crank, means for feeding the coil-forming wire to said crank, means for reversing the motion of the crank after a full coil is wound, and a loop-forming mechanism placed in the path of the wire on reversing the motion of the winding-crank, substantially as set forth.

6. The combination, with means for supporting an armature-core, of a coil-winding crank, a hollow shaft for the same, means for guiding the coil-forming wire through said shaft to the end of the crank, means for imparting rotary motion to the shaft of the winding-crank, means for reversing the motion of the winding-crank when a full coil is wound, and a loop-forming mechanism adapted to engage the wire when the motion of the crank is reversed so as to form a loop at the end of each coil, substantially as set forth.

7. In a machine for winding drum-armatures, the combination of a winding-crank, means for intermittently rotating an armature-core on its axis so as to present a new set of core-grooves to the winding-crank, means for feeding the wire to said winding-crank, means for rotating said crank, means for intermittently reversing the motion of the winding-crank, a loop-forming mechanism, and means for intermittently actuating the same so as to form a loop at the end of each coil, substantially as set forth.

8. In a machine for winding drum-armatures, the combination of stationary and adjustable centers for the shaft of an armature-core, a cylinder for supporting the adjustable center, means for connecting said cylinder with an armature-shaft supported in said centers, means for longitudinally adjusting the cylinder, a coil-winding mechanism, and a pawl-and-ratchet mechanism for intermittently actuating the cylinder so as to turn the armature-core on its axis for presenting a new set of grooves to the action of the winding mechanism, substantially as set forth.

9. In a machine for winding drum-armatures, the combination, with a driving-shaft, of a second shaft supported at right angles thereto, a bevel gear-wheel at the end of the main driving-shaft, intermeshing bevel gear-wheels mounted loosely on the second shaft, a clutch device for moving the bevel gear-wheel on the main driving-shaft into mesh with either one of the transmitting bevel gear-wheels, a worm-gear transmission operated by one of the bevel-gears, a fulcrumed lever actuated intermittently by said worm-gear transmission, a slide-bar connected with said fulcrumed lever and adapted for shifting the clutch so as to cause it to mesh with one or the other bevel gear-wheel for reversing the motion of the second shaft, and a coil-winding crank at the end of the second shaft, substantially as set forth.

10. In a machine for winding drum-armatures, the combination, with a coil-winding crank, of a longitudinally-guided and spring-actuated shaft for said crank, means for rotating said shaft, a stationary cam, and a collar on the shaft provided with antifriction-rollers that are placed twice in contact with the stationary cam for each rotation of said shaft so as to impart thereby twice longitudinally-reciprocating motion to the winding-crank during each rotation of the same, substantially as set forth.

11. In a machine for winding drum-armatures, the combination of a coil-winding crank, a rotary shaft to which said winding-crank is applied, a sleeve surrounding said tubular shaft, a helical spring interposed between said sleeve and shaft, a collar on said shaft provided with antifriction-rollers at diametrically opposite points, a stationary cam for engaging said rollers twice at each rotation of the shaft so as to produce the reciprocation of the shaft and winding-finger of the shaft twice during each rotation, substantially as set forth.

12. In a machine for winding drum-armatures, the combination of a coil-winding crank, a tubular shaft to one end of which said crank is applied, a wire-spool supported at the opposite end of said tubular shaft, guide-rollers for the wire located in the tubular shaft and on the winding-crank, a pair of guide-rollers at the end of the winding-crank, and means for imparting rotary motion to the shaft of the winding-crank, substantially as set forth.

13. In a machine for winding drum-armatures, the combination, with means for supporting the armature-core, of a rotary coil-winding crank, an intermittently-oscillating loop-forming finger, a guide-arm for said finger, and means for shifting said guide-arm and oscillating the finger after a full coil is wound on the armature-core, substantially as set forth.

14. In a machine for winding drum-armatures, the combination of means for supporting an armature-core, a coil-winding crank, a rotary shaft to which the winding-crank is applied, means for imparting rotary motion to said shaft in one direction, reversing mechanism for reversing the motion of the winding-crank after a coil is wound, a loop-forming finger located above the armature, a guide-arm for supporting the loop-forming finger, and means for actuating the arm and finger when the motion of the winding-crank is reversed so as to form a wire loop at the end of each coil, substantially as set forth.

15. In a machine for winding drum-armatures, the combination, with a rotary coil-winding crank provided with guide-rollers and a spring-actuated tension-roller for the wire to be wound, of a releasing-lever actuated by the shank of said tension-roller, and a stop-motion operated by said releasing-lever and connected by intermediate lever mechanism with a clutch on the main shaft, so as to arrest the motion of the machine on the breakage of the wire, substantially as set forth.

16. In a machine for winding drum-armatures, the combination of means for supporting an armature-core, a pawl-and-ratchet mechanism for intermittently turning an armature-core supported thereby, a winding mechanism for winding the coils on the armature-core, and a stop-motion for arresting the motion of the machine when all the coils are wound on the armature, substantially as set forth.

17. In a machine for winding drum-armatures, a loop-forming mechanism consisting of a curved guide-arm above the armature, an oscillating loop-forming finger supported on said guide-arm, and means for moving the finger into the path of the wire for forming the loop in connection with the end of the guide-arm, substantially as set forth.

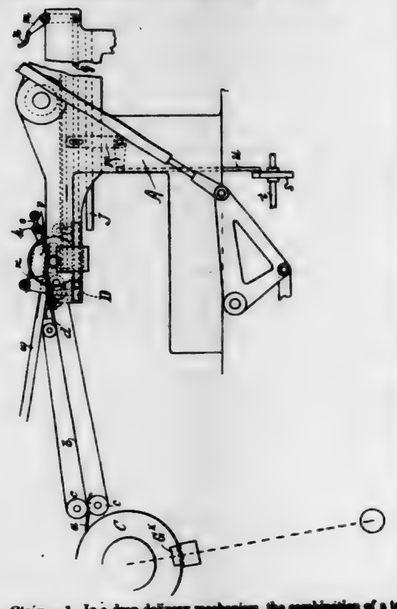
18. In a machine for winding drum-armatures, a loop-forming mechanism actuated after each coil is wound and consisting of a curved guide-arm extending over the armature-core, and loop-forming finger pivoted to said guide-arm, means for oscillating the finger for shedding the loop of the coil last formed, and means for returning the finger into the path of the wire after the succeeding coil is formed for forming the new loop in connection with the end of the guide-arm, substantially as set forth.

19. In a machine for winding drum-armatures, a loop-forming mechanism actuated after each coil is wound and consisting of a curved guide-arm extending over the armature-core, a loop-forming finger pivoted to said guide arm, means for oscillating the finger for shedding the loop of

the preceding coil, means for returning the finger into the path of the wire after the succeeding coil is wound, for forming the loop over the finger and the end of the guide-arm, and means for shifting the guide-arm finger, and loop for clearing the next pair of armature-grooves for winding the next coil, substantially as set forth.

20. In a machine for winding drum-armatures, the combination, with means for intermittently rotating an armature-core, of a coil-winding mechanism, means for reversing said coil-winding mechanism after each coil is wound, a loop-forming mechanism actuated during the reversing of the coil-winding mechanism, and a stop device for the reversing mechanism for controlling the reverse motion of the winding mechanism until the loop is formed, substantially as set forth.

709,180. DELIVERY MECHANISM. WALTER SCOTT, Plainfield, N. J. Filed Apr. 27, 1901. Serial No. 57,738. (No model.)



Claim.—1. In a drop-delivery mechanism, the combination of a to-and-fro-moving carriage, an extensible collapsible sheet-supporter operated thereby, a feed-board from which slip-sheets may be fed, and means underneath said board for feeding printed sheets onto said supporter underneath the slip-sheets, substantially as described.

2. In a drop-delivery mechanism, the combination of a to-and-fro-moving carriage, upper and lower gripper members thereon, a feed-board at the receiving end of said delivery mechanism from which slip-sheets may be fed to said grippers, and means underneath said board for feeding printed sheets to said grippers underneath the slip-sheets, whereby slip and printed sheets are gripped together at their heads and are associated as said grippers draw them out, substantially as described.

3. In a drop-delivery mechanism, the combination of a to-and-fro-moving carriage, fixed lower and movable upper gripper members thereon, a feed-board at the receiving end of said mechanism from which slip-sheets may be fed to said grippers, gages for said slip-sheets, and means underneath said board for feeding printed sheets to said grippers underneath said slip-sheets, substantially as described.

4. In a drop-delivery mechanism, the combination of a to-and-fro-moving carriage, upper and lower gripper members thereon, an extensible collapsible sheet-supporter operated by said carriage a feed-board from which slip-sheets may be fed, and means underneath said board for feeding sheets onto said supporter and to said grippers underneath the slip-sheets, substantially as described.

5. In a drop-delivery mechanism, the combination of a to-and-fro-moving carriage, fixed lower and movable upper grippers thereon, an extensible collapsible sheet supporter, a feed-board for slip-sheets, and means underneath said board for feeding printed sheets onto said supporter and to said grippers.

6. The combination with an impression-cylinder delivering sheets at its front, of a feed-board from which slip sheets are fed onto the printed sheets, the slip and the printed sheets moving in the same direction, and the slip-sheets subsiding upon the printed sheets as the latter are moved outward, and a delivery apparatus adapted to deliver associated sheets together on the receiving-board.

7. In a printing-press, the combination of an impression-cylinder delivering sheets at its front, a feed-board placed in front of said cylinder above the path of the printed sheets and from which slip-sheets may be fed to the sheet-path, both printed and slip sheets moving in the same direction, and the slip-sheets subsiding upon the printed sheets as the latter are moved outward, and a reciprocating delivery apparatus adapted to lay associated sheets on the receiving-board.

8. In a printing-press, the combination of an impression-cylinder delivering sheets at its upper front side, a feed-board placed above the path of the printed sheets, and sheet-supporting fingers at the lower end of said board for preventing the slip-sheets from resting on the printed sheets until the front ends of both meet at a common point.

9. In a printing-press, the combination of an impression-cylinder delivering sheets at its upper front side, a feed-board placed above the path of the printed sheets, sheet-supports at the lower end of said board for preventing the slip-sheet from resting on the printed sheet until both meet at a common point, and a reciprocating delivery mechanism adapted to deliver both sheets simultaneously.

10. In a printing-press, the combination of an impression-cylinder delivering sheets at its upper front side, a feed-board placed above the path of the printed sheets and from which slip-sheets may be fed, feed-gages to which the slip-sheets are fed so as to deliver them at the same point at which the printed sheets are delivered to the delivery mechanism, and said delivery mechanism for delivering said sheets flat on a receiving-board.

11. In a printing-press, the combination of an impression-cylinder receiving sheets at its upper side and delivering them at its front side into a sheet-path, a feed-board arranged above said path and from which slip-sheets may be fed in register with the front end of and associated with the printed sheets, and a reciprocating delivery mechanism adapted to deliver the associated sheets on a receiving-board.

12. In a stop-cylinder printing-press, the combination of an impression-cylinder delivering the printed sheets in front thereof, a feed-board from which slip-sheets may be fed to a point where the front edges of the printed sheets stop, said sheets being associated at such point, and a reciprocating delivery apparatus adapted to seize the associated sheets and draw them over the receiving-table.

13. In a stop-cylinder printing-press, the combination of an impression-cylinder delivering the printed sheets at its front side, a feed-board from which slip-sheets may be fed to a point where the front edges of the printed sheets stop, the slip and the printed sheets moving in the same direction, and the slip-sheets subsiding upon the printed sheets as the latter are moved outward, and a delivery mechanism provided with grippers for seizing the associated slip and printed sheets and drawing them out over a receiving-board.

14. In a stop-cylinder printing-press, the combination with an impression-cylinder delivering the printed sheets at its front, a feed-board from which slip-sheets may be fed to a point where the front edges of the printed sheets stop, said sheets being associated at such point, and a reciprocating delivery mechanism having a sheet-support, of a receiving table or board.

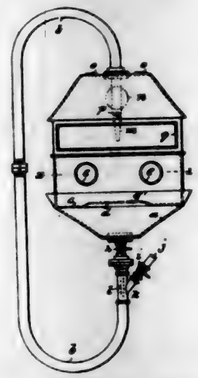
15. In a stop-cylinder printing-press, the combination of an impression-cylinder delivering the printed sheets at its front, a feed-board from which slip-sheets may be fed to a point where the front edges of the printed sheets stop, said sheets being associated at such point, a reciprocating delivery mechanism provided with grippers and with a sheet-support, said grippers seizing the heads of the associated sheets, and a receiving table or board.

16. In a stop-cylinder printing-press, the combination of an impression-cylinder delivering the printed sheets into a path in front thereof, the sheet stopping simultaneously with the cylinder, a feed-board from which slip-sheets may be fed to overlie the printed sheets from the front edges thereof, and a reciprocating delivery mechanism adapted to seize both sheets while in or near a state of rest and to deliver them onto a receiving board or table.

17. The combination of a reciprocating delivery having grippers which close to seize sheets and open to release them, a feed-board from which sheets may be fed to gages, the gages, and cam-operated means which simultaneously lower the gages and open said grippers.

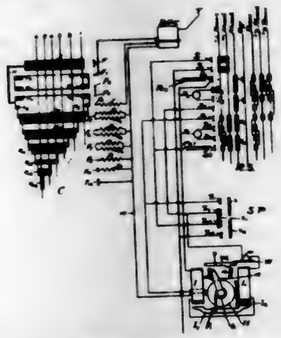
709,181. SAND-BLAST APPARATUS. THEODORE A. RIPPEL, Newark, N. J. Filed Apr. 18, 1902. Serial No. 103,051. (No model.)

Claim.—1. In a sand-blast apparatus, comprising a casing, with the lower portion formed as a hopper for the abrasive material used; a valve to govern the flow of such abrasive material to an inner ejector-nozzle; and a pipe governed by a valve to convey an air-blast to such ejector; said pipe being attached at an angle downward so that the blast it carries may impinge upon and control the lower parts of such inner ejector-nozzle, and thus draw the abrasive material with it and force it through a fixed metallic tube connected thereto and adapted to carry it from the ejector at the bottom to a detachably-exchangeable blast-nozzle at the top of said casing, which nozzle extends downwardly therein; substantially as shown and described and for the purposes set forth.



2. In a sand-blast apparatus, having its lower portion formed as a hopper for the abrasive material; the combination of an outlet-valve to govern the flow from such hopper, with an ejector, the inner tube of which extends to, and is beveled at right angles with an air-pressure inlet also governed by a valve; and a curved fixed metallic tube terminating in a detachable nozzle, connecting said ejector with the central top of such apparatus to convey the abrasive blast thereto; and a horizontal wire screen extending across the lower portion of the apparatus having a central sheet-metal shield which serves both as a rest for the articles to be operated upon and to protect the said hopper from the disturbing force of the said abrasive blast; substantially as shown and described, and as and for the purposes set forth.

709,182. CONTROLLER FOR ELECTRIC MOTORS. EMMETT W. SPELL, Johnstown, Pa., assignor, by mesne assignments, to Westinghouse Electric and Manufacturing Company, Pittsburg, Pa., a Corporation of Pennsylvania. Filed June 10, 1901. Serial No. 63,940. (No model.)



Claim.—1. In controlling mechanism for electric motors, the combination of a rheostatic switch, a mechanically-independent series-parallel switch, actuating means for the last-named switch operated by current derived from one of the motors temporarily acting as a generator for that purpose, and restraining means for said series-parallel switch controlled by the rheostatic switch.

2. In controlling mechanism for electric motors, the combination of a rheostatic switch having an open-circuit position, a separate series-parallel switch, a magnet or magnets for actuating said series-parallel switch connected in shunt with one of the motor-armatures, and means for preventing effective action of said magnet or magnets so long as the motor-circuit remains unbroken by the rheostatic switch, and means for utilizing such action to move the series-parallel switch from its series to its parallel position when the rheostatic switch is moved across its open-circuit position.

3. In controlling mechanism for electric motors, the combination of a rheostatic switch, having an open-circuit position, a separate series-parallel switch, a magnet or magnets for actuating said series-parallel switch connected in shunt with one of the motor-armatures, and means for preventing effective action of said magnet or magnets so long as the motor-circuit remains unbroken by the rheostatic switch, and means for utilizing such action to move the series-parallel switch from its series to its parallel position when the rheostatic switch is moved across its open-circuit position, together with suitable means, as a spring, for returning the series-parallel switch to series position when the rheostatic switch is brought to rest at its open-circuit position.

4. In controlling mechanism for electric motors, the combination of a manually-operated rheostatic switch having an open-circuit position, a separate series-parallel switch, means for automatically actuating said series-parallel switch in one direction by a movement of the rheostatic switch across its open-circuit position, and means for automatically actuating it in the opposite direction when the rheostatic switch is rested at its open-circuit position.

5. In controlling mechanism for electric motors, the combination of a rheostatic switch, a separate series-parallel switch, means for automatically actuating said series-parallel switch controlled by the movement of the rheostatic switch, and means for restraining such actuating means except under certain conditions, such restraining means being also controlled by the movement of the rheostatic switch.

6. In controlling mechanism for electric motors, the combination of a rheostatic switch having an open-circuit position, a separate series-parallel switch, means for automatically actuating said series-parallel switch controlled by the movement of the rheostatic switch, and electromagnetic restraining means for the series-parallel switch having its coil included in the main motor-circuit.

7. In controlling mechanism for electric motors, the combination of a rheostatic switch, having an open-circuit position, a separate series-parallel switch, an electromagnet having its coil or coils connected in shunt with an armature of one of the motors, an operative connection between the armature of said magnet and the series-parallel switch, and means for restraining the movement of the series-parallel switch except when the circuit is opened at the rheostatic switch.

8. In controlling mechanism for electric motors, the combination with a switch for connecting motors, or motor groups, in both series and parallel relation, of an electromagnet having one or more coils in shunt to one of the motor-armatures, a mechanical connection between the armature of said magnet and the movable member of said switch for moving the switch in one direction, a spring for actuating the switch in the opposite direction, and means whereby said magnet is effective only when the motor-circuit is opened and its coil or coils are energized by current generated by said armature turning in the residual field of the motor.

9. In controlling mechanism for electric motors, the combination with a series-parallel switch, and electromagnetic means for actuating the same, of a coil adjacent to said switch and included in the main circuit to the motors, pole-pieces exterior to said coil, and an arm of magnetic material attached to the movable member of said switch and extending between said pole-pieces, said arm forming a part of the magnetic circuit from the coil through said pole-pieces.

10. In controlling mechanism for electric motors, the combination with a series-parallel switch, and an electromagnet for actuating the said switch, having its coil or coils arranged to be connected in shunt with a motor-armature, of a coil connected in the main circuit to the motors, a pair of pole-pieces adjacent to the said coil, an arm connected to the movable member of said switch and extending between the said pole-pieces, said arm forming a part of the magnetic circuit from the coil to the pole-pieces, and an auxiliary switch arranged to close the shunt circuit of the magnet coil or coils at predetermined times.

11. In controlling mechanism for electric motors, the combination with a series-parallel switch, an electromagnet for actuating the same, having its coil or coils arranged to be connected in shunt with a motor-armature, and an auxiliary switch for effecting such connection, of a coil connected in the main circuit to the motors, a pair of pole-pieces adjacent to the said coil, and an arm connected to the movable member of the said switch and extending between the said pole-pieces, said arm forming a part of the magnetic circuit from the coil to the pole-pieces, and also arranged to operate the said auxiliary switch.

12. In controlling mechanism for electric motors, the combination of a rheostatic switch, having an open-circuit position, a separate series-

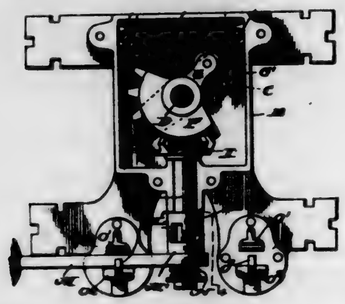
parallel switch, an electromagnet for actuating the said switch, said magnet having its coil or coils included in a shunt around one of the motor-armatures, and means whereby said magnet is effectually energized only when the motor-circuit is broken and the said armature is turning in a residual field of the motor, said rheostatic switch having an open-circuiting position which can be reached by movement of said switch in either direction, whereby the same set of movable switch-contacts are used for rheostatic control for both series and multiple relations of the motors.

13. In mechanism for the control of electric motors, a rheostatic switch having a compound blow-out coil, one part of which is always in series with the motors, and the other part of which is placed in series with the first part at the time the said switch is moved to its off position.

14. In mechanism for the control of electric motors, a rheostatic switch arranged to successively connect a number of resistance-coils in multiple in the motor-circuit, and to remove the same, of a blow-out coil therefor composed of two members, one of which is always in series with the motors, and the other of which is connected in series with a resistance-coil, and contacts in said switch for placing the last-named member of the blow-out coil and also the said resistance-coil in series with the motors as the switch is moved to its off position.

15. In mechanism for the control of electric motors, a rheostatic switch having a main group of contacts for controlling resistance in various ways to the motor-circuit, a secondary group of short contacts arranged to insert additional resistance in series in the motor-circuit just previous to breaking such circuit, and connections leading from the supply-conductor to each of said groups.

709,183. SWITCH-OPERATING DEVICE. JOSEPH STUPAR and FREDERICK STUPAR, Chicago, Ill. Filed Jan. 4, 1902. Serial No. 88,600. (No model.)



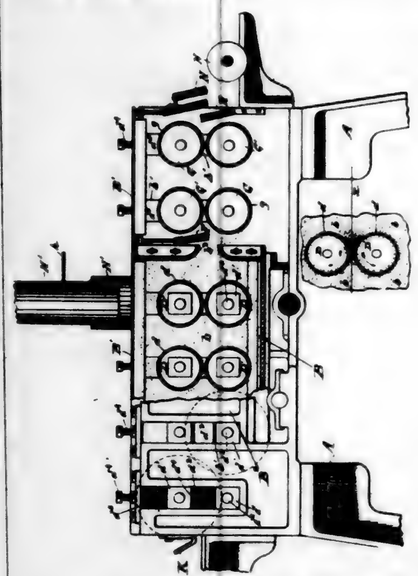
Claim.—1. In a switch-operating device, the combination with an operating-bar, a crank-arm to which said bar is connected, of the shaft carrying said crank-arm, an operating-lever, means for connecting the operating-lever with the shaft a shaft upon which the said operating-lever is loosely mounted, gearing connecting the said shaft carrying the lever, and the shaft carrying the crank-arm, all arranged and adapted to operate substantially as shown and described.

2. In a switch-operating device the combination with the operating-lever carrying a clutch-collar, of the horizontal shaft also provided with the clutch-collar and provided with a spring for throwing the said collars into engagement, a pinion carried by the horizontal shaft, a toothed segment adapted to engage the pinion, a vertical shaft carrying the said segment, said shaft carrying a signal at its upper end, and a crank-arm at its lower end, said crank-arm being adapted for engagement with the switch-bar, substantially as described.

3. In a switch-operating device, the combination with the switch-bar and crank-arm, of the vertical shaft to which the crank-arm is attached, the toothed segment mounted upon the vertical shaft and having the finger carrying a roller, a spring against which the rollers bears, a horizontal shaft carrying a pinion at one end, and a clutch-collar adjacent to the opposite ends an operating-lever loosely mounted upon the said horizontal shaft and provided with a clutch-collar adapted for engagement with the collar upon the shaft, and a spring for forcing the said collars into engagement, substantially as set forth.

4. In a switch-operating device, a lever-locking mechanism comprising a guide member, and the housing, a locking-catch pivoted in the said housing and provided with a shoulder at its lower end, a spring-actuated arm arranged within the housing and adapted to engage the said shoulder end of the catch, and a rotary hub adapted to engage the said spring-actuated arm for the purpose of disengaging the same and releasing the lever, substantially as set forth.

709,184. TIN-PLATE-CLEANING MACHINE. JOHN C. TALIAFERRO and CHARLES M. REYNARD, Baltimore, Md. Filed Nov. 29, 1901. Serial No. 83,986. (No model.)



Claim.—1. In a tin-plate-cleaning machine, the combination with a box or receptacle containing a mass or body of bran or cleaning material, and having slots or openings at its ends for the sheets to pass through, of cleaning-rolls revolving together in pairs in the body of cleaning material, with a space between the rolls of each pair, and carrying on their surfaces layers of bran or cleaning material in contact with the sheets passing between them and operating to feed and force the sheets forward by the agency of the cleaning material itself, substantially as specified.

2. The combination with a box or receptacle containing a mass or body of cleaning material, of a pair of separated rolls revolving in said body or mass and operating to force the sheets through said body or mass by the agency of the cleaning material itself, substantially as specified.

3. The combination with a box or receptacle containing a mass or body of cleaning material, of a pair of separated rolls, said rolls having different surface speeds, revolving in said body or mass and operating to force the sheets through said body or mass by the agency of the cleaning material itself, substantially as specified.

4. The combination with a receptacle containing a mass or body of cleaning material, of a series of pairs of separated rolls having fibrous coverings revolving in said body or mass and feeding or forcing the sheets through said body or mass through the agency of the cleaning material itself between the rolls and the sheets passing between them, substantially as specified.

5. The combination with a receptacle containing a mass or body of cleaning material of a series of pairs of separated rolls having fibrous coverings revolving in said body or mass and feeding or forcing the sheets through said body or mass through the agency of the cleaning material itself between the rolls and the sheets passing between them, a feed or supply pipe for delivering the cleaning material to said box or receptacle, and a discharge pipe or hopper for the cleaning material, substantially as specified.

6. The combination with a receptacle containing a mass or body of cleaning material, of a series of pairs of separated rolls revolving in said body or mass and feeding or forcing the sheets through said body or mass through the agency of the cleaning material itself between the rolls and the sheets passing between them, and dusting or polishing rolls, substantially as specified.

7. The combination with a tinning mechanism feed or discharge chute down which hot, freshly-tinned sheets pass, of a receptacle containing a body of bran or cleaning material into which the hot sheets pass directly from said feed or discharge chute, rolls revolving in pairs in said cleaning material and operating to feed or force the sheets through the same, the hot sheets heating the cleaning material and the cleaning material covering the sheets and causing them to retain their heat during the cleaning operation, substantially as specified.

8. The combination with a tinning mechanism feed or discharge chute down which hot, freshly-tinned sheets pass, of a receptacle containing a body of bran or cleaning material into which the hot sheets pass directly from said feed or discharge chute, rolls revolving in pairs in said cleaning material and operating to feed or force the sheets through the same, the hot sheets heating the cleaning material and the cleaning material covering the sheets and causing them to retain their heat during the cleaning operation, the rolls of each pair being at a distance apart, and means for driving the rolls at different speeds, substantially as specified.

9. In a tin-plate-cleaning machine, the combination with a bran-holding box, of a series of pairs of rolls revolving and enveloped in the body of bran and between which the sheets pass, substantially as specified.

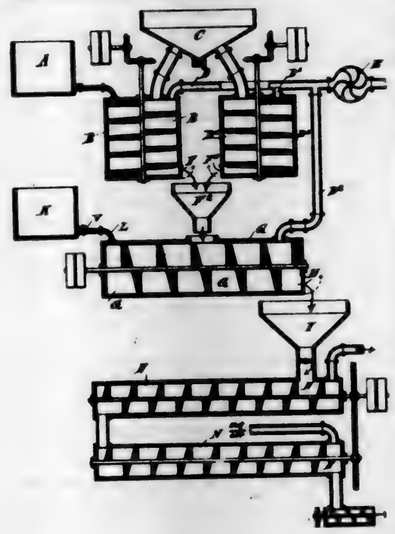
10. In a tin-plate-cleaning machine, the combination with a bran-holding box, of pairs of fast and slow cleaning-rolls revolving in the body of cleaning material, substantially as specified.

11. The combination with a bran-box having opposite sides furnished with vertical slots or ways to receive the boxes or journals of the roll-shafts, of cleaning-rolls revolving therein and having boxes or journals fitting in said slots or ways, substantially as specified.

12. The combination with a bran-box having opposite sides furnished with vertical slots or ways to receive the boxes or journals of the roll-shafts, of cleaning-rolls revolving therein and having boxes or journals fitting in said slots or ways and springs interposed between the boxes of the rolls, substantially as specified.

13. In a tin-plate-cleaning machine, the combination with a box or receptacle containing a mass or body of bran or cleaning material, having slots or openings at its ends for the sheets to pass through, of cleaning-rolls revolving together in pairs in the body of the cleaning material, with a space between the rolls of each pair, carrying on their surfaces layers of the bran or cleaning material in contact with the sheets passing between them, and a brush at the exit-slot in said box for the sheets to prevent the cleaning material issuing too rapidly at the exit-slot, substantially as specified.

709,185. PROCESS OF MAKING FERTILIZERS. BRUNO TERNE, Philadelphia, Pa. Filed May 7, 1902. Serial No. 106,355. (No specimens.)



Claim.—The process herein described of making fertilizers, which consists in treating a phosphate-containing substance with sulfuric acid for rendering the same more fully soluble, simultaneously agitating the mass and adding slowly to the same a concentrated ammoniacal liquor and drawing off the resulting fumes, forcing a current of dry heated air through the mass and simultaneously agitating the same, and finally grinding and pulverizing the mass for use, substantially as set forth.

709,186. BLUE DYE AND PROCESS OF MAKING SAME. ARTHUR WEINBERG and FELIX KLIEGMANN, Frankfort-on-the-Main, Germany, assignors to Leopold Cassella & Co., Frankfort-on-the-Main, Germany. Filed Dec. 31, 1901. Serial No. 87,957. (Specimens.)

Claim.—1. The process of producing blue cotton dyestuffs of the herein-described constitution which consists in diazotizing one molecule of amido acetnaphtalid sulfo-acid, combining successively with two molecules of Cleve acid, diazotizing again and finally combining with one molecule of 2 amido 5 naphthol 7 sulfonic acid substantially as described.

2. The blue cotton dyestuff of the constitution mentioned above which is a dark-blue or bronzy powder easily soluble in water with a bright blue color, being precipitated by addition of hydrochloric acid, dissolving with a blackish-blue shade in concentrated sulfuric acid, separating from such solution by addition of water and dyeing unmordanted cotton indigo-blue shades fast to light substantially as described.

709,187. YELLOW ACRIDIN DYE AND PROCESS OF MAKING SAME. ARTHUR WEINBERG, Frankfort-on-the-Main, Germany, assignor to Leopold Cassella & Co., Frankfort-on-the-Main, Germany. Filed Jan. 14, 1902. Serial No. 89,793. (Specimens.)

Claim.—1. The process of producing new acridin dyestuffs by heating acridin compounds of the formula $C_{13}H_{11}N.(NX)_2$ where X means hydrogens or alcoyls, or the corresponding base derivatives, together with aromatic amins and formaldehyde substantially as described.

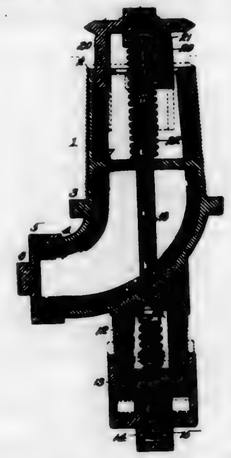
2. As a new article of manufacture the coloring-matter which can be obtained by the condensation of acridin yellow, formaldehyde and aromatic amins, and which dissolves in water with a yellow shade, in alcohol with a yellow shade showing a green fluorescence, in diluted mineral acids with an orange shade, and which dyes tanned cotton fast yellow shades substantially as described.

709,188. WALL-FINISH AND PROCESS OF MAKING SAME. GEORGE W. WOSSKA, St. Louis, Mo. Filed Apr. 28, 1902. Serial No. 105,006. (No specimens.)

Claim.—1. The process of manufacturing a lusterless non-peeling wall-finish which consists of the following steps: soaking four pounds of gum-tragacanth in water for twenty-four hours, then boiling the same for one hour, straining the resultant solution, mixing it with two thousand pounds of pure raw pulverized marble, drying and pulverizing the mixture thus formed, and adding alum and glue in the proportions specified, substantially as and for the purposes set forth.

2. A composition of matter constituting an improved wall-finish, consisting of the following materials in substantially the described proportions, by weight: pure raw pulverized marble, two thousand parts; gum-tragacanth, four parts; glue, eighty parts; and alum twenty parts.

709,189. FAUCET OR TAP. LEO WOLF, Kansas City, Mo. Filed Mar. 29, 1902. Serial No. 100,008. (No model.)



Claim.—1. A tap or faucet, comprising a tubular plug, having a valve-seat at one end and terminating in an offsetting arm or nozzle at

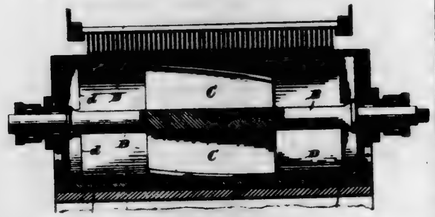
the other, and provided with a tubular threaded arm in axial alinement with the tubular plug valve-seat, a longitudinally-extending rod arranged centrally of the tubular threaded arm and provided with a valve at one end and a thread at the other, the thread running oppositely to that of the tubular arm, and a threaded cap engaging said threaded arm and provided also with a thread engaging that of the valve-rod, so that when turned longitudinal movement shall be imparted to the rod.

2. A tap or faucet, comprising a tubular plug having a valve-seat at one end and terminating in an offsetting arm or nozzle at the other, and provided internally with a centrally-apertured cross-bar, and externally at the opposite end from said valve-seat with a hole and a second valve-seat, a rod extending through said bar and said hole and provided at one end with a valve to engage the first-named seat, and with a second valve to engage the external valve-seat, and means, carried by the plug for imparting longitudinal movement to said rod so as to simultaneously move said valves toward and from their respective seats.

3. A tap or faucet, comprising a tubular plug having a valve-seat at one end and terminating in an offsetting arm or nozzle at the other, and provided internally with a centrally-apertured cross-bar, and externally at the opposite end from said valve-seat with a hole and a second valve-seat, a rod extending through said bar and said hole and provided at one end with a valve to engage the first-named seat, and with a second valve to engage the external valve-seat, and a spring to hold said rod with its last-named valve yieldingly against said external seat.

4. A tap or faucet, comprising a tubular plug having a valve-seat at one end and terminating in an offsetting arm or nozzle at the other, and provided internally with a centrally-apertured cross-bar, and externally at the opposite end from said valve-seat with a hole and a second valve-seat, a rod extending through said bar and said hole and provided at one end with a valve to engage the first-named seat, and with a second valve to engage the external valve-seat, a spring to hold said rod with its last-named valve yieldingly against said external seat, and means, carried by the plug for withdrawing said rod and reseating the first-named valve against the resistance of said spring.

709,190. DIPPING-ROLL FOR MATCH-MACHINES. JACOB P. WEIMER, Akron, Ohio, assignor to the Diamond Match Company, New York, N. Y., a Corporation of Illinois. Filed Jan. 17, 1902. Serial No. 90,173. (No model.)



Claim.—1. The combination of a composition vat or receptacle, a hollow dipping-roll, and means within the roll for agitating the composition, substantially as and for the purpose described.

2. The combination of a composition vat or receptacle, a hollow dipping-roll, and means for causing movement of the composition through the roll, substantially as and for the purpose described.

3. The combination of a composition vat or receptacle, a hollow dipping-roll, having passages between its interior and exterior, and means for causing circulation of the composition into, through and out of the roll, substantially as and for the purpose described.

4. The combination of a composition vat or receptacle, a hollow dipping-roll, having passages between its interior and exterior, and means within the roll for causing circulation of the composition, substantially as and for the purpose described.

5. The combination of a composition vat or receptacle, a hollow roll, and spiral arms therein, substantially as and for the purpose described.

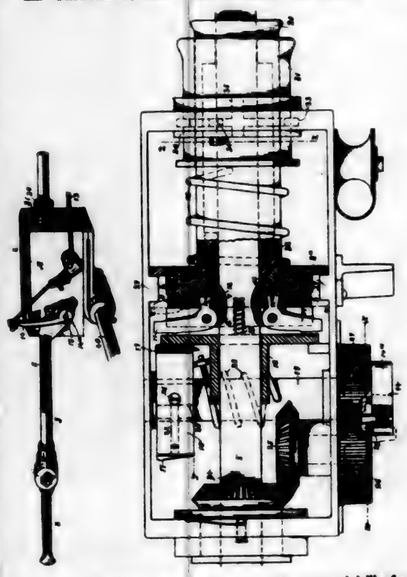
6. The combination of a composition vat or receptacle, a hollow roll, a shaft, and spiral arms between the shaft and roll, substantially as and for the purpose described.

7. The combination of a composition vat or receptacle, a hollow roll having passages at its ends, a shaft, and spiral arms between the shaft and roll, substantially as and for the purpose described.

8. The combination of a composition vat or receptacle, and a hollow roll whose ends have projecting lugs between which are spaces for the passage of composition, substantially as and for the purpose described.

9. The combination of a composition vat or receptacle, a hollow roll whose ends have projecting lugs between which are spaces for the passage of composition, and means for causing composition to pass through the roll, substantially as and for the purpose described.

709,191. ROCK-DRILL. RUSSELL AVERY, Sausalito, Cal., assignor to Avery Drill Company, San Francisco, Cal., a Corporation of California. Filed Dec. 21, 1901. Serial No. 86,850. (No model.)



Claim.—1. The combination in a manually-operated drill, of a casing and a bevel-gear located within the casing through which the drill-bar is guided and slidable, a second bevel-gear mounted upon a transverse shaft engaging the first-named gear, a lever-arm exterior to the casing with connections whereby the gears and drill may be turned by the movement of the lever, a cord having one end connected with the outer end of the lever and the opposite end with the person of the hammer-wielder whereby the drill is turned at each backward swing of the body, and a spring by which the lever is returned to its normal position when released.

2. The combination in a drill of a casing and a bevel-gear through which the drill-bar is guided and slidable, a transverse shaft carrying a bevel-gear engaging the first-named and a spur-gear upon the outer end, a second transverse shaft having a spur-gear upon its outer end engaging the spur-gear of the first-named shaft, an exterior lever, a cord connecting its outer end with a means to reciprocate it, means connecting the inner end of the lever with the second shaft whereby said shaft is turned by a forward movement of the lever, and a spring by which the lever and shaft are returned to their normal position when released.

3. The combination in a drill of a casing, a drill-bar guided and movable therethrough, bevel-gears through which movement is transmitted to turn the drill, a transverse shaft in the casing, a lever-arm fixed to the outer end of the shaft through which movement is transmitted to turn the shaft, a clamping device adapted to grip the drill-bar, a cam carried by and turnable with the shaft by which said clamp grips and retracts the drill-bar at the first part of the turning of the shaft and gears and pawl-and-ratchet mechanism by which the movement of the shaft is subsequently transmitted to turn the drill.

4. The combination in a drill of a casing through which the drill-bar is guided and slidable, bevel-gears by which the drill is turnable, a clamping mechanism by which the drill-bar is engaged and retracted previous to turning, said mechanism consisting of a transverse shaft carrying the clamp-actuating cam, a lever fixed upon the outer end of the shaft through which movement is transmitted, a gear and internal ratchet loosely turnable upon the shaft, a spring-pressed pawl-pin carried by the lever and movable therewith so that the drill is retracted before the pawl engages the ratchet, and a second gear through which motion is transmitted from the first one to turn the drill.

5. The combination in a drill of a casing, a drill-bar guided and slidable therethrough, means for retracting the drill previous to turning, consisting of teeth or serrations upon the drill-bar, pawls adapted to engage said teeth, means by which said pawls are forced into engagement consisting of a revolvable cam and disk through which movement is transmitted, a shaft by which the cam is carried, a lever-arm fixed to the outer end of the shaft, connections between said lever-arm whereby it is moved, and the shaft and cam partially rotated, and the spring connected with the shaft by which the parts are returned to their normal position.

6. The combination in a drill of a casing, a drill the bar of which is guided and slidable therethrough, teeth or serrations formed upon the drill-bar, pawls and a carrier within which they are movable, levers engaging said pawls, a cam mounted upon a shaft and turnable therewith, a disk slidable upon the drill-bar against which disk the cam acts and through which the pawl-levers are actuated, and the pawl caused to grip the drill-bar and the latter is retracted.

7. The combination in a drill of a casing, a drill, the bar of which is guided and slidable within the casing, a gripping mechanism consisting of pawls and levers by which they are caused to grip the drill-bar, a cam mounted upon a revolvable shaft through which cam the movement is transmitted to actuate the pawl-levers, a shaft through which motion is transmitted to the cam, said shaft having ratchet-teeth and turnable loosely in one direction within the cam, a spring-pressed pawl carried by the cam and engaged by the teeth of the shaft when turned to advance the cam, and a spring by which the shaft is turned backwardly when impelling pressure is removed.

8. In a drill, a casing, a drill, the bar of which is guided and slidable therein, gripping pawls and levers by which they are forced into contact with the drill-bar, a cam mounted upon a transverse revolvable shaft, and by which the pawl-levers are actuated, pawl-and-ratchet connections between the cam and the shaft upon which it is mounted whereby the cam is advanced when the shaft is turned in one direction and a spring by which the shaft is returned within the cam when the turning pressure is relieved.

9. In a drill, a casing, a drill the bar of which is guided and slidable within the casing, mechanism by which the drill-bar is first retracted and subsequently turned, said mechanism consisting of pawls and a cam by which the pawls are caused to grip and retract the drill-bar, a shaft upon which the cam is carried, a spur-gear loosely mounted upon the shaft having a ratchet-wheel formable in unison with it, a lever-arm fixed upon the shaft through which power is transmitted to turn it, a spring-pressed pawl carried by the lever and normally out of operative contact with the ratchet-teeth whereby the shaft and cam are moved before the pawl engages the ratchet, a second spur-gear engaged by the first mounted upon a shaft within the casing, and bevel-gears through which motion is transmitted to turn the drill-bar when the pawl has engaged with the ratchet, and a spring surrounding the first-named shaft whereby the shaft and parts carried thereby are returned to their normal position after the pull upon the lever has been released.

10. In a drill, a casing, a drill the bar of which is guided and slidable therein, an oscillating lever and a transverse shaft to which it is fixed, a cam and gripping-pawls actuated thereby to first retract the drill, spur and bevel gears carried thereby through which motion is transmitted from the shaft to subsequently turn the drill and a spring acting against the pawl-carriers whereby the drill is forced against the surface to be operated on when released from its pawls.

11. In a drill, the casing, a drill, the bar of which is guided and slidable within the casing, gripping mechanism by which the drill-bar is retracted, and bevel-gears by which it is subsequently turned, a lever, a shaft to which it is connected, and a cam and pawl-and-ratchet mechanism actuated by said shaft to retract and turn the drill successively, a sleeve extending through the rear of the casing and connected with the pawl-carrier, a second sleeve surrounding the first one and itself movable through the end of the casing, a spiral spring surrounding the first sleeve, with one end pressing against the pawl-carrier and the other against the inner end of the outer sleeve, an annular groove in the casing, a lug carried by the outer sleeve, a channel by which it may be moved to engage the groove or the face of the sleeve in front thereof to regulate the tension of the spring.

12. The combination in a drill of a casing and a bevel-gear through which the drill-bar is guided and slidable, a transverse shaft carrying a bevel-gear engaging the first named, and a spur-gear upon the outer end, a second transverse shaft having a spur-gear upon its outer end engaging the spur-gear of the first-named shaft, an exterior lever, a cord, one end of which is connected to the outer end of the lever, and the other end with a means by which it may be periodically reciprocated between the drill-impelling blows, means connecting the inner end of the lever with the second shaft, whereby said shaft is turned by a forward movement of the lever, and a spring by which the lever and shaft are returned to their normal position when released.

709,192. SHOVEL-SUPPORT. JAMES BAKER, Carroll, Nebr. Filed Nov. 12, 1901. Serial No. 82,000. (No model.)

Claim.—1. The combination with a shovel, of a support therefor, and an elastic connection between the shovel and support, the said connection being rotatable and also longitudinally slidable on the said support.

2. The combination with a shovel, of a support therefor, and a spring interposed between the shovel and support and connected at opposite ends therewith.

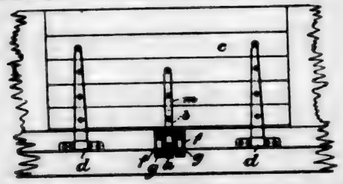
3. The combination with a shovel, of an overhead supporting-rod, and a spring connected at one end to the shovel and having its opposite end connected with the supporting-rod so as to be capable of a sliding movement thereon.

4. The combination with a shovel, and a clevis applied thereto, of an overhead supporting-rod, and a spring connecting between the clevis and supporting-rod capable of a sliding movement on said rod.

5. The combination with a shovel, and a clevis applied thereto and provided with a series of openings, of an overhead supporting-rod, and a spring having a sliding connection with said rod, and an adjustable connection with the clevis.

6. The combination with a shovel, of a support therefor comprising a standard, a reversible crane-arm connected with said standard, a support carried by said crane arm and a yielding connection between the shovel and said support.

709,198. DOOR FOR RAILWAY-WAGONS OR THE LIKE. FRED BAINES, Sheffield, England. Filed Dec. 13, 1901. Serial No. 85,746. (No model.)



Claim.—1. The combination of a door for railway-wagons and the like, mounted vertically on a horizontal pivot and adapted to open downward to a horizontal position, with means for balancing the weight of the door when opened downward and limiting its downward motion.

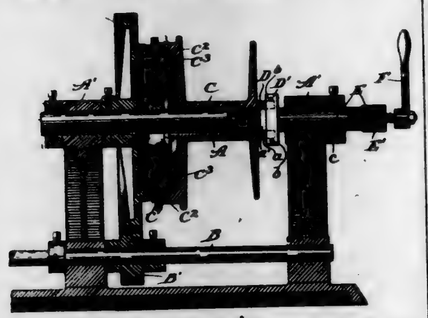
2. The combination of a door for railway-wagons and the like, mounted vertically on a horizontal pivot and adapted to open downward into a horizontal position, with means capable of adjustment for balancing the weight of the door when opened downward and limiting its downward motion.

3. The combination of a door for railway-wagons and the like, mounted vertically on a horizontal pivot and adapted to open downward into a horizontal position, with a spring for balancing the weight of the door when opened downward and limiting its downward motion.

4. The combination of a door for railway-wagons and the like, mount-

ed vertically on a horizontal pivot and adapted to open downward into a horizontal position, with a spring for balancing the weight of the door when opened downward and limiting its downward motion, and means for adjusting the tension of the spring, substantially as described.

709,194. FRICTION-CLUTCH. GEORGE M. BENNETT, Kenosha, Wis., assignor of one-half to Thomas Forgham, Kenosha, Wis. Filed July 13, 1901. Serial No. 68,196. (No model.)

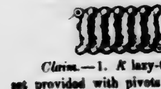


Claim.—1. The combination of a driving member and a driven member, one of said members being provided with a cone and the other with a bell for receiving said cone, a sectional collar loosely supported between said bell and cone and means for shifting one of said first-named members to press the sectional collar into engagement with the other member to produce frictional engagement between said collar and both said members, substantially as described.

2. In a friction-clutch, the combination of a driving member and a driven member, one of said members being provided with a cone and the other with a bell for receiving said cone, a peripheral channel being provided between said cone and bell, blocks of friction material loosely supported within said channel, and means for shifting one of said members to produce frictional engagement, substantially as described.

3. In a friction-clutch, the combination of a driving member and a driven member, one of said members being shiftable, a loose collar comprising blocks of friction material supported between said first-named members, and means for shifting said shiftable member, thereby to produce friction between both said first-named members and said sectional collar, for the purpose set forth.

709,195. BAND FOR BRACELETS, &c., AND METHOD OF MANUFACTURING SAME. THOMAS S. BENNETT, Providence, R. I. Filed Dec. 23, 1900. Serial No. 41,236. (No model.)



Claim.—1. *R* lazy-tongs band composed of two sets of arms, one set provided with pivots and the other with means for the reception of said pivots, the said pivot-bearing arms each comprising a plate having suitable pivots secured thereto, and a recessed body within which said pivot-bearing plate is secured, substantially as and for the purpose set forth.

2. A lazy-tongs band composed of two sets of arms, one set provided with pivots and the other with means for the reception of said pivots, the said pivot-bearing arms each comprising a plate having suitable pivots secured thereto, and a body-piece formed of stamped-up sheet metal, the said pivot-bearing plate being placed within the body-piece with the edges of the latter bent inwardly to secure said plate in place, substantially as and for the purpose set forth.

3. A lazy-tongs band composed of pairs of pivoted arms, the front one of each of which pairs comprises a recessed body and a plate provided with pivots and placed within the recess of said body with the pivots projecting from the rear face thereof, and the rear arm of said pair comprising a recessed body having the outer face thereof perforated to receive the pivots projecting from the said front arm and provided upon the interior with a suitable plate for receiving and holding the said pivots, substantially as and for the purpose set forth.

4. A lazy-tongs band composed of pairs of arms pivoted to each other at or near their centers and having the ends thereof pivoted to the corresponding ends of the adjacent pair of arms, each of the said pairs of arms comprising, first, a front arm comprising a recessed body and a plate provided with a central pivot and a second plate having a pivot at each end thereof, said plates being set within said body with the pivots thereof projecting from the rear face of said arm, and, second, a rear arm comprising a body recessed upon the rear face thereof and having its outer face provided with perforations for receiving the three pivots projecting from the said front arm, and a plate secured within the recess of said rear arm for receiving and holding each of said pivots, substantially as and for the purpose set forth.

5. A lazy-tongs band composed of pairs of arms pivoted to each other at or near their centers and having the ends thereof pivoted to the corresponding ends of the adjacent pair of arms, each of the said pairs of arms comprising, first, a front arm comprising a recessed body and a plate provided with a central pivot and a second plate having a pivot at each end thereof, said plates being set within said body with the pivots thereof projecting from the rear face of said arm, and, second, a rear arm comprising a body recessed upon the rear face thereof and having its outer face provided with perforations for receiving the three pivots projecting from the said front arm, and a plate secured within the recess of said rear arm for receiving and holding each of said pivots, and, third, a spring interposed between the two said arms and projecting into each of them and normally tending to close the arms on the central pivot on each other, substantially as and for the purpose set forth.

6. A lazy-tongs band composed of pairs of arms pivoted to each other at or near their centers and having the ends thereof pivoted to the corresponding ends of the adjacent pair of arms, each of the said pairs of arms comprising, first, a front arm comprising a recessed body and a plate provided with a central pivot and a second plate having a pivot at each end thereof, said plates being set within said body with the pivots thereof projecting from the rear face of said arm, and, second, a rear arm comprising a body recessed upon the rear face thereof and having its outer face provided with perforations for receiving the three pivots projecting from the said front arm, and a plate secured within the recess of said rear arm for receiving and holding each of said pivots, and, third, a coiled spring surrounding said central pivot and having one end thereof projecting into the interior of the front arm and the other end projecting into the interior of the rear arm and acting to normally close the arms on each other on the central pivot, substantially as and for the purpose set forth.

7. A lazy-tongs band composed of pairs of arms pivoted to each other at or near their centers and having the ends thereof pivoted to the corresponding ends of the adjacent pair of arms, each of the said pairs of arms comprising, first, a front arm comprising a body recessed upon its rear face, and a plate provided with a central pivot and placed within the recess of said body together with a second plate provided with a central perforation for the central pivot of the first plate to project through and having a pivot projecting from each end thereof and also placed within said recess and secured therein so that the three said pivots project rearwardly from the said front arm, and, second, a rear arm comprising a body recessed upon its rear side and formed upon its outer face with a central perforation for receiving the central pivot of its fellow-arm and end perforations for receiving the end pivots of the front arms of the next adjacent pair of arms, and a plate fixed within the recess of said rear arm for receiving and holding the said pivots, substantially as and for the purpose set forth.

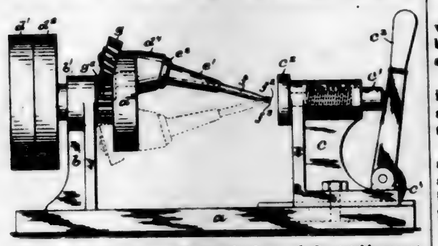
8. A lazy-tongs band composed of pairs of arms pivoted to each other at or near their centers and having the ends thereof pivoted to the corresponding ends of the adjacent pair of arms, each of the said pairs of arms comprising, first, a front arm comprising a body recessed upon its rear face, and a plate provided with a central pivot and placed within the recess of said body together with a second plate provided with a central perforation for the central pivot of the first plate to project through and having a pivot projecting from each end thereof and also placed within said recess and secured therein so that the three said pivots project rearwardly from the said front arm, and, second, a rear arm comprising a body recessed upon its rear side and formed upon its outer face with a central perforation for receiving the central pivot of its fellow arm and end perforations for receiving the end pivots of the front arms of the next adjacent pairs of arms, and a plate fixed within the recess of said rear arm for receiving and holding the said pivots, and a backing-plate secured over the recess of said rear arm to close and conceal the same, substantially as and for the purpose set forth.

9. A lazy-tongs band composed of sets of pairs of pivoted arms, each of the said pairs of arms comprising, first, a front arm consisting in a recessed body *a*, and a plate *b* provided with a rearwardly-projecting central pivot *c* and set within said recess, another plate *d* provided with a central perforation *d'* through which the said central pivot *c* projects and each plate provided at its ends with rearwardly-projecting pivots *c'*, the said plate *d* being set within the recess of the body *a* and the edges of the latter bent over upon the same, and, second, a rear arm comprising a recessed body *f*, having the outer face thereof formed with a central opening *f'* for receiving the central pivot *c* of the front arm and also formed with end perforations for receiving the end pivots *c'* of the next adjacent pair of arms, and a plate *h*, secured within the recess of said rear arm for receiving and holding the said pivots *c* and *c'*, substantially as and for the purpose set forth.

10. A lazy-tongs band composed of sets of pairs of pivoted arms, each of the said pairs of arms comprising, first, a front arm comprising a recessed body *a*, and a plate *b*, provided with a rearwardly-projecting central pivot *c*, and set within said recess, another plate *d* provided with a central perforation *d'* through which the said central pivot *c* projects and each plate provided at its ends with rearwardly-projecting pivots *c'*, the said plate *d* being set within the recess of the body *a* and the edges of the latter bent over upon the same, and, second, a rear arm comprising a recessed body *f*, having the outer face thereof formed with a central opening *f'* for receiving the central pivot *c* of the front arm and also formed with end perforations for receiving the end pivots *c'* of the next adjacent pair of arms, and a plate *h*, secured within the recess of said rear arm for receiving and holding the said pivots *c* and *c'*, and a backing-plate *i*, placed over the recess of the body *f*, for closing the same, substantially as and for the purpose set forth.

11. A lazy-tongs band composed of sets of pairs of pivoted arms, each of the said pairs of arms comprising, first, a front arm consisting in a recessed body *a*, and a plate *b*, provided with a rearwardly-projecting central pivot *c* and set within said recess, another plate *d* provided with a central perforation *d'* through which the said central pivot *c* projects and each plate provided at its ends with rearwardly-projecting pivots *c'*, the said plate *d* being set within the recess of the body *a* and the edges of the latter bent over upon the same, and, second, a rear arm comprising a recessed body *f*, having the outer face thereof formed with a central opening *f'* for receiving the central pivot *c* of the front arm and also formed with end perforations for receiving the end pivots *c'* of the next adjacent pair of arms, and a plate *h*, secured within the recess of said rear arm for receiving and holding the said pivots *c* and *c'*, and, third, a coiled spring *e* surrounding the central pivot *c* and having one end *e'* thereof projecting into the said front arm and engaging a fixed point therein and the other end e^2 projecting into the rear arm and engaging a fixed point therein the said spring tending to normally close the pair of arms on each other on the central pivot, substantially as and for the purpose set forth.

709,196. TUBULAR-RIVET-SETTING MACHINE. THOMAS S. BENNETT, Attleboro, Mass., assignor to The D. F. Briggs Company, Attleboro, Mass. Filed Feb. 24, 1902. Serial No. 95,203. (No model.)



Claim.—1. In a rivet-setting mechanism, a shaft rotatably mounted in bearings, a head formed integral with or secured to the shaft, means for rotating the shaft, a bearing set at an angle and formed integral with the head, a tool-holder in the bearing, and means for rotating the bearing around the tool-holder and retarding or holding the tool-holder from rotating on its own axis.

2. In a rivet-setting mechanism, a shaft rotatably secured in bearings, a head secured to the shaft, means for rotating the shaft, a bearing set at an angle in the head and offset from the center of the shaft, a tool-holder shaft in the bearing, a tool-holder on the shaft, a riveting-tool secured in the tool-holder, and gearing connecting the tool-holder shaft with a fixed gear to retard or hold the tool-holder shaft from rotating.

3. In a rivet-setting mechanism, a head rotatably secured in bearings, a riveting-tool set at an angle in and offset from the center of the head, means for rotating the head, and gearing connecting the riveting-tool with a fixed gear to retard or hold the riveting-tool from rotating.

4. In a rivet-setting mechanism, a head formed integral with or secured to a shaft rotatably mounted in bearings, a riveting-tool set at an angle in the head and having a face set at right angle to the axis of the tool, and means for rotating the head to give to the face of the riveting tool a continuous rocking motion, as described.

5. In a rivet-setting mechanism, a shaft rotatably mounted in a bearing, a head secured to the shaft, a gear fixed to the bearing intermediate the head and the bearing and surrounding the shaft, a bearing in the head offset from the center of the shaft and set at an angle to the shaft, a tool-holder in the bearing, a riveting-tool secured in the holder having a face at right angle to its axis and a cone-shaped point projecting from its face, a skew-gear secured to the end of the tool-holder, an intermediate gear pivotally secured to the head connecting the skew-gear with the fixed gear for retarding or holding the riveting-tool from rotating, means for forcing the face of the riveting-tool against the tubular end of the rivet, and means for rotating the riveting mechanism to give to the face of the riveting-tool a continuous rocking motion to force or roll the tubular end of the rivet over and upon the article to be riveted, as described.

6. In a tubular or semitubular riveting machine, the base *a*, the head-stock *b* secured to the base, the tail-stock *b* adjustably secured to the base, the spring-pressed plunger *c* with the end c^3 in the tail-stock and on a line with the riveting-tool, the lever c^5 pivotally held in position to operate on the plunger *c'* by the stop c^4 to force the rivet against the face of the riveting-tool, the shaft *d* having its bearing *b'* in the head-stock *b* and carrying the fast pulley *d'* and the loose pulley d^2 on its outer end, and the head d^3 on its inner end, the bearing d^4 set at an angle in the head, the tool-holder shaft *e* in the bearing d^4, the tool-holder *e'* secured to the shaft *e* and having the shoulder e^3 shaped on its inner face to run on a circle of balls e^4, the cup-shaped depression or raceway e^5 in the end of the bearing d^4 forming a ball-bearing to take the thrust of the riveting-tool, the tapered hole e^6 for frictionally securing the tapered end *f'* of the riveting-tool *f* to the tool-holder, the cone-shaped point f^2 to slightly expand the tubular end of the rivet, and the flange or face f^3 to roll or force the end of the rivet over and upon the article to be riveted, the skew-gear *g* on the shaft *e*, the intermediate gear *g'* pivotally secured to the head d^3 by the stud g^2, and the fixed gear g^3 secured to the bearing *b'* and surrounding the shaft *d*, as and for the purpose described.

709,197. DETONATING DEVICE. JAMES H. BEVINGTON, Cleveland, Ohio. Filed Aug 29, 1901. Serial No. 73,673. (No model.)

Claim.—1. A detonating-head formed in two sections and provided with a series of radially-disposed barrels and discharge-openings in the bottom section into the inner portions of said barrels, the inner ends of said barrels being closed by a wall, substantially as described.

2. A sectional detonating-head comprising two equal sections having a plurality of radiating barrels between them, a head constructed to attach a handle and provided with a stem extending through said sections and constructed to hold them together, substantially as described.

3. As a new article of manufacture, a circular detonating-head with a flat bottom and a series of barrels therein open at its periphery and about its center and bottom, and a handle having a stem with a smooth base portion and a threaded outer portion on which said head is separably supported, substantially as described.

709,198. PETROLEUM INCANDESCENT-LIGHT BURNER. MAX BRAMSON, Warsaw, Russia, assignor to Henry F. Vogel, St. Louis, Mo. Filed June 24, 1901. Serial No. 65,310. (No model.)

Claim.—1. In a burner, the combination with a mantle and the wick-tube, of a detachable member supported upon the upper end of the

wick-tube and having an air-mixing chamber, inlets to said chamber for cold air and for hot air and an outlet for the mixed air communicating with the interior of the mantle.

2. In a burner of the class described, the combination with a chimney, a wick-tube, and a mantle, of a pair of apertured caps forming a detachable member, which is supported upon the upper end of the wick-tube, and has an air-mixing chamber receiving fresh and heated air, one of said caps being provided with apertures through which the air passes from said mixing-chamber to the interior of said mantle.

3. In a burner, the combination with a mantle and the wick-tube, of a detachable member supported upon the upper end of the wick-tube and having an air-mixing chamber, inlets to said chamber for cold air and for hot air and an outlet for the mixed air communicating with the interior of the mantle, and a copper ring supported above the wick-tube.

4. In a burner of the class described, the combination of an outer wick-tube, an inner wick-tube of less height than said outer tube, a cone fitting over said outer tube and having an annular flange arranged to project over a wick positioned between said tubes, and a mantle; said cone being provided with apertures for the admission of air therewith, substantially as described.

5. In a burner of the class described, the combination of an outer wick-tube, an inner wick-tube of less height than said outer tube, a cone fitted to said outer wick-tube, a flange on the interior of said cone arranged to project over the wick positioned between said wick-tubes, a cone-cap mounted on said cone, and a mantle; said cone and cone-cap being provided with apertures for the admission of air to the interior of the mantle, substantially as described.

6. In a burner of the class described, the combination of an outer wick-tube, an inner wick-tube of less height than said outer tube, an apertured cone fitting over said outer wick-tube, an annular flange on the interior of said cone arranged to project over the upper end of the wick positioned between said wick-tubes, a cone-cap provided with apertures in its wall and in its upper end, and a mantle, substantially as described.

7. In a burner of the class described, the combination of an outer wick-tube, an inner wick-tube of less height than said outer tube, an air-distributer positioned within said inner tube, an apertured cone fitting over said outer wick-tube, an annular flange on the interior of said cone arranged to project over the upper end of the wick positioned between said wick-tubes, an apertured cone-cap surmounting said cone, and a mantle, substantially as described.

8. In a burner of the class described, the combination of an outer wick-tube, an inner wick-tube of less height than said outer tube, an apertured cone fitting over said outer wick-tube, an annular flange within said cone and arranged to project over the end of the wick positioned between said wick-tubes, an apertured cone-cap mounted on said cone, and an air-distributer positioned within said wick-tubes, a ring of material of greater heat conductivity than the burner surmounting the upper end of the wick-tubes, and a mantle, substantially as described.

9. The combination with a mantle, of a burner having air-inlets leading to the interior of the mantle, and an air-heating device composed of copper and located adjacent to said inlets and heating the air as it passes into the mantle.

10. The combination of a mantle, and a burner having an air-mixing chamber, the side walls of which extend to the top of the burner, an inlet to said chamber for cold air, an inlet to said chamber for conducting the hot air around said mantle into the mixing-chamber, and an outlet for mixed air communicating with the interior of the mantle between the burner and the inner face of the mantle.

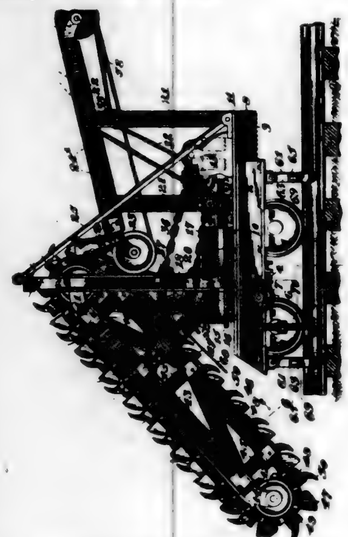
709,199. PORTABLE MECHANICAL LOADER AND DIGGER. GLENN C. BROWN, Birmingham, Ala. Filed Nov. 30, 1901. Serial No. 84,190. (No model.)

Claim.—1. In a portable mechanical loader and digger, the combination with the trucks of body portion, a sliding base secured on said body portion, a revolving plate secured on said sliding base, bucket-carrying apparatus supported on said revolving plate, belt-carrying apparatus supported on said sliding base, and a motor, substantially as described.

2. In a portable mechanical loader and digger, the combination with the trucks, of a body portion secured thereon, a sliding base carried on said body portion, racks formed on said sliding base, pinions carried in said body portion to mesh with said racks, a revolving plate carried on said sliding base, bucket-carrying apparatus supported on said revolving plate, belt-carrying apparatus and a motor carried on said sliding base substantially as described.

3. In a portable mechanical loader and digger, the combination with a body portion of track-clamps and jacks secured thereto, a sliding base carried thereon, a revolving plate secured on said sliding base, bucket-carrying apparatus supported on said revolving plate, belt-carrying apparatus and a motor supported on said sliding base, substantially as described.

4. In a portable mechanical loader the combination of I-beams forming the body portion, rail-clamps and jacks secured thereto, smaller I-beams, a sliding base carried thereon, rollers supporting said smaller I-beams and sliding base, racks formed on said smaller I-beams, pinions carried in said body portion to mesh with said racks, a hand-wheel adapted to turn said pinions, and move said sliding base, bucket-carrying apparatus supported on said sliding base, belt-carrying apparatus and a motor supported on said sliding base, substantially as described.



5. In a portable mechanical loader the combination of the body portion, a sliding base carried thereon, a foot-plate secured to said sliding base a revolving plate pivotally mounted on said foot-plate, bucket-carrying apparatus supported on said revolving plate, means for revolving said plate and bucket-carrying apparatus, belt-carrying apparatus and a motor supported on said sliding base, substantially as described.

6. In a portable mechanical loader and digger, the combination of a body portion, a sliding base carried thereon a foot-plate secured on said sliding base, a revolving plate pivotally mounted on said foot-plate, rollers adapted to support said revolving plate, a rearwardly-extending arm secured to said revolving plate, means for swinging said arm in either direction, bucket-carrying apparatus supported on said revolving base, belt-carrying apparatus and a motor supported on said sliding base, substantially as described.

7. In a portable mechanical loader and digger, the combination of a body portion, a sliding base carried thereon, a foot-plate secured on said sliding base, a revolving plate pivotally mounted on said foot-plate, rollers adapted to support said revolving base, a rearwardly-extending slotted arm secured to said revolving plate, a nut loosely carried in said slot, a threaded bolt passing through said nut, means for turning said bolt, bucket-carrying apparatus supported on said revolving plate, belt-carrying apparatus and a motor supported on said sliding base, substantially as described.

8. In a portable mechanical loader and digger, the combination of a base, a revolving plate supported thereon, uprights carried on said revolving plate, braces for said uprights, bucket-carrying apparatus supported by said uprights, belt-carrying apparatus and a motor supported on said base, substantially as described.

9. In a portable mechanical loader and digger, the combination of a base, a revolving plate supported thereon, uprights carried on said revolving plate, upwardly and forwardly inclined supports carried on said revolving plate, bucket-carrying apparatus pivoted to said uprights and adapted to be supported by said upwardly and forwardly inclined supports, belt-carrying apparatus and a motor supported on said base, substantially as described.

10. In a portable mechanical loader and digger, the combination of a base, a revolving plate mounted thereon, uprights supported on said revolving plate upwardly and forwardly inclined bucket-carrier supports carried on said revolving plate, bucket-carrying apparatus pivoted to said uprights, adjusting means carried on said upwardly and forwardly inclined

bucket-carrier supports, brace-rods extending from said base to the tops of said uprights, belt-carrying apparatus and a motor supported on said base, substantially as described.

11. In a portable mechanical loader and digger, the combination of a base, a revolving plate mounted thereon, uprights supported on said revolving plate, bucket-carrying apparatus pivoted to said uprights, chain sprocket-wheels and chain-guide sheaves carried on said uprights, belt-carrying apparatus and a motor supported on said base, substantially as described.

12. In a portable mechanical loader and digger, the combination of a base, a revolving plate mounted thereon, uprights carried on said revolving plate bucket-carrying apparatus pivoted to said uprights, a connecting-piece uniting said uprights at their tops, brace-rods extending from said base to a point above said connecting-piece, a connecting-rod uniting said brace-rods, a pin connecting said connecting-piece and connecting-rod directly over the pivotal point of said revolving plate, belt-carrying apparatus and a motor supported on said base, substantially as described.

13. In a portable mechanical loader and digger, the combination of a base, a revolving plate carried thereon, uprights secured to said revolving plate, upwardly and forwardly inclined supports secured to said revolving plate, a connecting-piece uniting said supports, means for raising and lowering said connecting-piece, bucket-carrying apparatus supported on said connecting-piece, belt-carrying apparatus and a motor supported on said base, substantially as described.

14. In a portable mechanical loader and digger, the combination of a base, a revolving plate carried thereon, uprights secured to said revolving plate, upwardly and forwardly inclined supports secured to said revolving plate, a connecting-piece uniting said supports at their tops means for raising said connecting-piece in position, a U-shaped piece secured to said connecting-piece, bucket-carrying apparatus adapted to be supported in said U-shaped piece belt-carrying apparatus and a motor supported on said base, substantially as described.

15. In a portable mechanical loader and digger, the combination of a base, belt-carrying apparatus and a motor supported thereon, a revolving plate mounted thereon, uprights and supports secured to said revolving plate, bucket-carrying apparatus carried by said uprights and supports, and comprising channels, sprocket-hangers secured to the ends thereof, chain-sprockets carried by said hangers, a bucket-chain carried on said sprockets, buckets carried on said chain, and means for raising or lowering said buckets and carrying apparatus, substantially as described.

16. In a portable mechanical loader and digger, the combination with a base and bucket-carrying apparatus of uprights secured to said base, chain-guide sheaves secured in the after uprights, a belt-carrier frame secured to said uprights, belt-drums carried at the ends of said frame, a belt carried on said drums, means for adjusting said belt, means for raising and lowering said frame, and means for driving said belt, substantially as described.

17. In a portable mechanical loader and digger, the combination with a base, and bucket-carrying apparatus of uprights carried on said base, a belt-carrier frame supported on said uprights, belt-drums carried at the ends of said frame, a belt-carrier on said drums, means for adjusting said belt, means for raising and lowering said frame, chain-guide sheaves journaled in the after uprights means for adjusting said chain-sheaves, and means for driving the belt, substantially as described.

709,200. COMBINATION NETHER GARMENT. MINNIE R. BUCKLEY, St. Louis, Mo. Filed Mar. 5, 1902. Serial No. 96,810. (No model.)

Claim.—1. In a garment of the character described, a main garment portion, a corset-cover permanently connected therewith, both of which terminate at their upper portion in a single set of shoulder-straps connected to said main garment and said corset-cover; substantially as described.

2. In a garment of the character described, a main garment portion, and a corset-cover secured thereto at the back and for a portion only of the front, said corset-cover terminating in integral flap portions separable from said main garment from the termination of the connection between said main garment and corset-cover to the free ends of said flaps; substantially as described.

3. In a garment of the character indicated, a main garment portion, shoulder-straps thereon, and a corset-cover permanently connected to said main garment portion and provided with integral flaps which, at the front of said main garment portion, detached and movable away from said main garment portion; substantially as described.

4. In a garment of the character indicated, a main garment portion, a corset-cover secured thereto along the upper rear edge and for a short distance in advance of the arm-holes along the upper front edge, flaps upon said corset-cover extending toward each other beyond the line at which said corset-cover and main garment portion are secured together at the front, and a single set of shoulder-straps; substantially as described.

709,201. BOTTLE-CLOSURE. WILLIAM J. BYCRAFT, Newton, Ind. Ter. Filed Dec. 11, 1901. Serial No. 85,467. (No model.)

Claim.—In combination with a bottle having an annular shoulder formed with and around the neck thereof, and also an annular groove formed in and around the neck between the mouth and the shoulder, said neck of the bottle also provided with a notch formed within the annular groove, a cap composed of brittle substance adapted to fit over the neck of the bottle, said cap provided with notches formed upon the interior thereof, said notches adapted to register with the annular groove in the neck of the bottle, said cap provided with a beveled surface formed upon the interior lower edge of the same, a ring adapted to lie within the annular groove of the neck, portions of said ring punched outward to form springs, said springs adapted to lie within the notches upon the interior of the cap, and the free ends of said springs adapted to prevent the cap from being rotated in either direction, a projection formed with said ring and extending into the notch within the annular groove upon the neck of the bottle, as and for the purpose specified.

709,202. SAFETY-STOP FOR CONVEYERS. PIERCE B. CLARKE, New York, N. Y. Filed Jan. 4, 1901. Serial No. 42,120. (No model.)

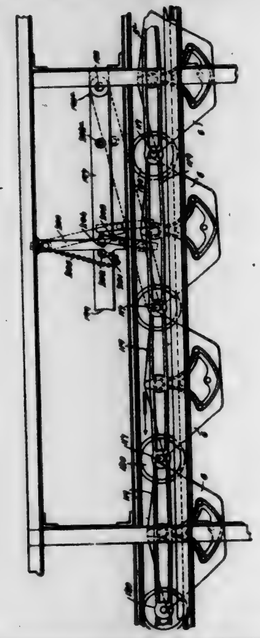
Claim.—1. In a device of the class described, the combination with an endless conveyer, of a stop arranged to lock the conveyer against backward movement, a support for holding the stop normally out of engagement with the conveyer, and a tripping device adapted to release the stop and arranged to be operated by the backward movement of the conveyer, substantially as described.

2. In a device of the class described, the combination with an endless conveyer, of a safety-stop arranged to engage the endless conveyer to lock the same against backward movement, said stop being located above the conveyer and normally held out of engagement with the same, and means operated by the backward movement of the conveyer for causing the safety-stop to engage the same, substantially as described.

3. In a device of the class described, the combination with an endless conveyer, of a movable frame arranged to engage the endless conveyer to lock the same against backward movement, a support for holding the frame normally out of engagement with the conveyer, and a tripping device for releasing the frame, substantially as described.

4. In a device of the class described, the combination with an end-

less conveyer, of a safety-stop located above and adapted to fall into engagement with the endless conveyer to lock the same against backward movement, means for supporting the safety-stop for holding the same normally out of engagement with the endless conveyer, and a tripping device arranged to release the safety-stop, substantially as described.



5. In a device of the class described, the combination with an endless conveyer, of a safety-stop located above and adapted to engage the endless conveyer to lock the same against backward movement, a support for holding the safety-stop normally elevated, and a tripping-lever mounted on the support and arranged in the path of the endless conveyer and adapted to be operated by the backward movement of the same, whereby the support is withdrawn from the safety-stop, substantially as described.

6. In a device of the class described, the combination with a conveyer, of a safety-stop located above and adapted to drop into engagement with the said conveyer, flexible connections for limiting the movement of the safety-stop to hold the same in proper position for engaging the conveyer, a support for holding the safety-stop normally in an elevated position, and a tripping-lever for releasing the safety-stop, substantially as described.

7. In a device of the class described, the combination with a conveyer, of a safety-stop located above and adapted to engage the conveyer, a support for holding the safety-stop normally out of engagement with the conveyer, said support being movable and provided with a projection, and a tripping-lever fulcrumed between its ends on the support and arranged to be carried into engagement with the said projection by the backward movement of the conveyer, whereby the support is withdrawn from the safety-stop, substantially as described.

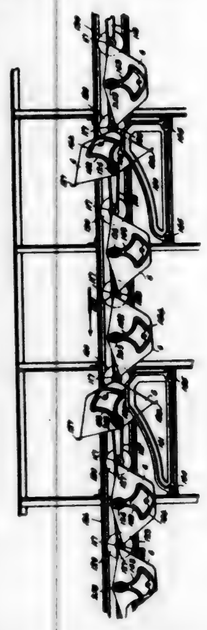
8. In a device of the class described, the combination with a conveyer, of a safety-stop adapted to engage the conveyer, a support for holding the safety-stop normally out of engagement with the conveyer, and a tripping-lever fulcrumed between its ends and having one of its arms arranged within the path of the conveyer, its other arm being arranged to engage the support, whereby the safety-stop will be released when the conveyer moves backward, substantially as described.

9. In a device of the class described, the combination with a conveyer, of a safety-stop consisting of an approximately rectangular frame hinged at one end and adapted to engage the conveyer, a movable hanger or support having a cast and arranged to receive the safety-stop, and a lever fulcrumed between its ends on the hanger or support and having one end arranged in the path of the conveyer, the other end of the lever being adapted to engage the support, substantially as and for the purpose described.

10. In a device of the class described, the combination with a conveyer, of a safety-stop consisting of an approximately rectangular frame hinged at one end at a point above the conveyer and adapted to swing downward to engage the said conveyer to lock the same against backward movement, and means for supporting and tripping the safety-stop, substantially as described.

11. In a device of the class described, the combination with a conveyer, of a safety-stop hinged at one end above the conveyer and provided with side bars and having a connecting-rod, a movable support provided with a cast arranged to receive the said rod, whereby the safety-stop is normally held out of engagement with the conveyer, a flexible connection for limiting the downward movement of the safety-stop, and a tripping-lever pivoted between its ends on the support and having one end arranged in the path of the conveyer its other end being adapted to engage the support and being swung away from the same by the forward movement of the conveyer and toward the support by the backward movement of the conveyer, substantially as and for the purpose described.

709,208. BUCKET FOR ENDLESS CONVEYERS. PIERRE B. CLARKE, New York, N. Y. Filed Jan. 28, 1901. Serial No. 44,782. (No model.)



Claim.—1. A conveyer having pivoted buckets and provided at intervals with cams of different widths, projecting laterally from the buckets different distances, combined with dumping-blocks located different distances from the center of the conveyer and adapted to be engaged by the said cams, whereby the conveyer is adapted to discharge at several points, substantially as described.

2. In a conveyer, the combination with dumping-blocks, of pivoted buckets provided with cams projecting laterally from the buckets different distances and arranged to be engaged by the said dumping-blocks, whereby the conveyer will discharge at different points, substantially as described.

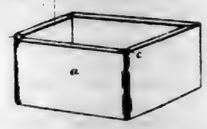
3. The combination with dumping-blocks, of pivoted buckets provided with cams 162 and 163 extending laterally from the buckets, the cams 162 being provided with lateral projections extending beyond the cams 163, substantially as and for the purpose described.

4. The combination of a conveyer having pivoted buckets provided at their sides with cams 162 and 163, the cam 162 being provided with lateral extensions or enlargements and the front and rear dumping-blocks located at different distances from the center of the conveyer, the front set of dumping-blocks being arranged in the paths of the extensions or enlargements and the other dumping-blocks being arranged to be engaged by the cams 163, substantially as described.

5. In a conveyer, the combination of the inner links provided with openings, the buckets provided at opposite sides with pivots or trunnions having reduced outer ends to fit the openings of the inner links and provided with longitudinal bores, a fastening device passing through the longitudinal bore, and a plate secured by the fastening device to the outer end of each of the pivots or trunnions and arranged to engage the inner links, substantially as described.

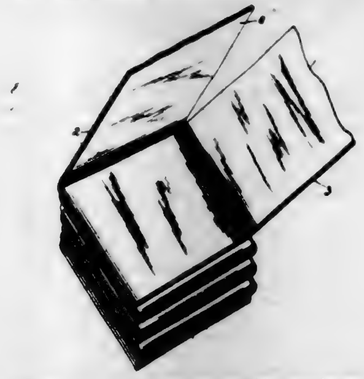
6. The combination of the inner and outer links, transverse shafts connecting the inner and outer links, pivoted buckets provided with hollow trunnions having reduced ends receiving the inner links, and fastening devices passing through the hollow trunnions and through the inner links and securing the buckets to the latter, substantially as described.

709,204. WOOD-BENDING. SPENCER CLARK, Northville, Mich., assignor to Archie Morris and Charles Walters, Northville, Mich. Filed Jan. 6, 1902. Serial No. 88,461. (No model.)



Claim.—A bent corner structure comprising a piece of wood formed with one or more recesses having a thin outer wall, and a corner-strip in said recess rounded on the side thereof adjacent to said wall, said piece bent about the curved side of the corner-piece, said wall thickened and reinforced adjacent to the corners of said recess, and said corner-strip correspondingly cut away adjacent to the reinforced portions of said wall.

709,205. ELECTRIC CONDENSER AND METHOD OF MAKING SAME. HENRY P. CLAUSEN, Chicago, Ill., assignor to American Electric Telephone Company, a Corporation of New Jersey. Filed Apr. 6, 1901. Serial No. 54,607. (No model.)



Claim.—1. An electric condenser comprising superimposed plates of suitable metal and dielectric arranged in two series, the said plates or sheets of each series being flexibly connected together, and the said sheets or strips when in place presenting flexible connections on all four sides of the condenser, whereby the superimposed plates or sheets of metal and dielectric of which the condenser is composed can be drawn apart without disconnecting the plates or sheets of one series from the plates or sheets of the other series, substantially as described.

2. An electric condenser composed of suitable sheets or plates of metal and dielectric, the said dielectric being in the form of two strips of suitable material arranged crosswise and folded back and forth alternately upon each other, the superimposed sheets or plates thus arranged presenting flexible connections on all four sides of the condenser, whereby the condenser plates or sheets may be drawn apart without disconnecting them from each other, substantially as described.

3. An electric condenser composed of superimposed sheets or plates of suitable metal and dielectric, the said metal sheets or plates being in the form of two strips arranged crosswise of each other and folded back and forth alternately in such manner as to present bends or flexible connections on all four sides of the condenser, substantially as and for the purpose set forth.

4. An electric condenser composed of superimposed sheets or plates of suitable metal and dielectric, the said sheets or plates being so folded and arranged as to present a plurality of bends or flexible connections on all four sides of the condenser, whereby the condenser can be extended for the purpose of exposing the surfaces of said sheets or plates, substantially as described.

5. The method of making electric condensers, which consists in combining suitable sheets or strips of metal and paper, arranging said sheets or strips crosswise and folding them back and forth alternately upon each other, so as to provide a condenser composed of superimposed plates or sheets of metal and dielectric so connected and arranged as to present a plurality of bends or flexible connections on all four sides of the condenser, suitably compressing this mass or bundle of sheet material, and then suitably treating the same with paraffin, substantially as described.

6. The method of making electric condensers, which consists in suitably preparing and combining sheets or strips of suitable metal and dielectric, arranging these said strips or sheets of metal and dielectric crosswise of each other, folding the said strips or sheets alternately back and forth upon each other, thereby causing the same to present a plurality of bends or flexible connections on all four sides of the condenser, and then suitably compressing or otherwise treating this mass or bundle of sheet material, substantially as described.

7. In an electric condenser, the combination with strips of metal at right angles and folded back and forth over each other alternately and forming the plates of the condenser, of a dielectric between the folds.

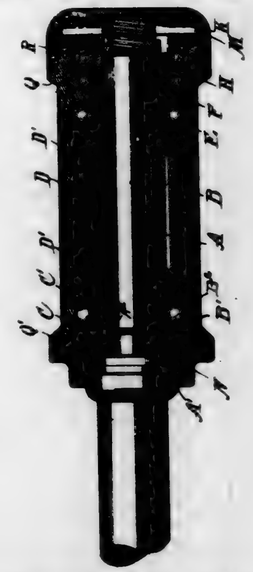
8. In an electric condenser, the combination with strips of metal at right angles to each other and folded back and forth alternately over each other to form superimposed layers, of a dielectric between the layers, and terminals for connecting with the plates.

9. A condenser, comprising continuous sheets or strips composed of tin-foil and paper, said sheets or strips being at right angles to each other and folded back and forth alternately over each other, the whole being compressed into a compact bundle.

10. A condenser composed of continuous strips of tin-foil and paper on both sides of the tin-foil, said strips being at right angles and folded back and forth alternately over each other, the whole being compressed into a compact mass, and boiled or soaked in paraffin or like substance.

11. In a condenser, two continuous strips composed of strips of paper with an interposed strip of tin-foil, said strips being at right angles to each other and folded back and forth alternately over each other, and terminals for the condenser comprising a metallic plate, as copper, placed next the tin-foil at one end of each strip.

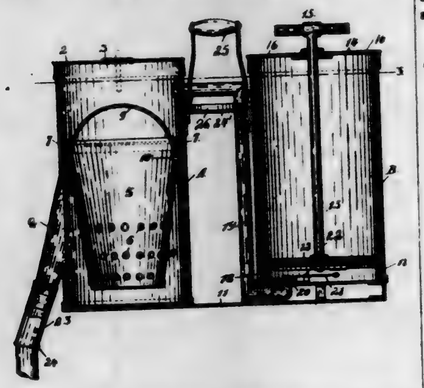
709,206. BALL-BEARING. HARLEY CORNWELL, Lakeview, Mich. Filed Oct. 9, 1901. Serial No. 78,114. (No model.)



Claim.—A ball-bearing for vehicles, comprising an axle having a shoulder A′ and a convexed shoulder A² adjacent thereto, combined with a sleeve B having a flanged end and a concaved shoulder B² in the wall

of its bore adjacent to said flange, said flange and conserved shoulder designed to contact with the shoulders A' and B' respectively, a hub having annular flanges D' which are flat on their outer faces, bearing-rings C and C' about said sleeve and interposed between one of said flanges D' and flange B', the bearing-ring E in contact with the outer of said flanges D', a bearing-ring F having its bore threaded a portion of its length and engaging the threads about the outer portion of the axle, the inner face of said bearing-ring F having a conceved bearing-shoulder, balls interposed between said bearing-rings, a threaded ring H also fitted on the threaded circumference of the axle and abutting against the outer face of said ring F, the inner end of the hub extending over said rings C C' and flange B', and dust-caps N and M with interiorly-threaded flanges fitted over threaded portions of the circumference of the hub at the ends thereof and abutting against shoulders thereon, as set forth.

709,207. **ANIMAL-EXTERMINATOR.** LORENZ H. CORBETT, Ballvidad, Cal. Filed Jan. 13, 1902. Serial No. 89,441. (No model.)



Claim.—1. The combination in an animal-exterminator of a generator-chamber having an internal ledge, a removable fire-pot having a bead to fit said ledge, and a handle by which the fire-pot may be removed from the chamber, an outlet from said generator and means for forcing a current of air through said generator.

2. The combination in an animal-exterminator of a generator-chamber, having a support on its inner wall, a removable perforated fire-pot suspended upon said support, and having a handle or bail by which it may be inserted into, and removed from, the chamber, a discharge-outlet from said generator, means by which air may be forced into the top of said generator and made to pass downwardly through said perforated pot.

3. The combination in an animal-exterminator of a generator having a ledge extending inward from its inner wall, a removable fire-pot fitting therein, and having a handle or bail by which it may be inserted into, and removed from, the chamber, said pot having a rim to engage said ledge and having tapered, perforated sides, said perforations forming the only channels of communication between the spaces in said chamber on either side of the bucket, means by which air is forced into the space above said bucket, and a discharge-outlet in the space below said bucket.

4. The combination in an animal-exterminator, of a generator, a perforated fire-pot fitting therein, an annular ledge on the interior of said generator engaging the said pot, and suspending the latter above the bottom of the generator, an air-pump and connections of said air-pump with the space in the generator above the bucket and a discharge-outlet intermediate of the sides of the pot and generator.

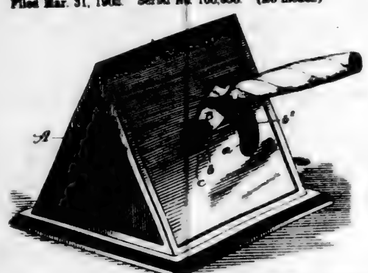
5. The combination in an animal-exterminator, of generator and pump cylinders arranged side by side, a single base to which they are both connected to form a rigid substantially unitary structure, a removable, perforated fire-pot fitting said generator-cylinder, and connections between said cylinders through which a current of air may be forced into the generator, and a discharge-outlet from the latter.

6. The combination in an animal-exterminator of generator and pump cylinders arranged side by side, means for rigidly connecting them to form substantially a unitary structure, said pump-cylinder having a plunger movable therein, valves in said plunger, a plunger-rod, a perforated cover through which said rod is slidable, air connections between the bottom of the pump-cylinder and the top of the generator-cylinder, a valve in said connections, a discharge-pipe entering said generator and movable jointed sections fitting the end of said pipe.

709,208. **CAR-WHEEL.** FREDERICK H. CRANDAL, Chicago, Ill., assignor of three-fifths to William B. Ewing and John A. Murphy, La Grange, Ill. Filed Feb. 6, 1902. Serial No. 92,890. (No model.)

Claim.—A wheel for railway-cars, the flange of which is provided with transverse ribs which extend inwardly from the periphery of the flange along the inner and outer faces of said flange, and which are made of greatest length at the periphery of the flange and of gradually lessening height or tapered at their end portions which so extend inwardly at the inner and outer faces of the flanges.

709,209. **CIGAR-CUTTER.** JOSEPH C. F. DICK, Belvidere, Ill. Filed Mar. 31, 1902. Serial No. 100,650. (No model.)



Claim.—1. A cigar-cutter comprising a vibratory part and a cutter arranged parallel to the plane of movement of the vibratory part, said vibratory part being provided with a cigar-receiving perforation the path of movement of which during the vibration of said part extends angularly across the cutting edge, and means for automatically bringing into use a new part of the cutting edge with each operation of the vibrating part, substantially as described.

2. A cigar-cutter comprising a slotted casing a swinging lever and a cutter arranged parallel to the plane of movement of said lever, the lever being provided at its free end with a cigar-receiving socket which extends through and works in the slot in the casing and the path of movement of which when the lever vibrates extends angularly across the cutting edge, substantially as described.

3. A cigar-cutter comprising a slotted casing a vibratory part and a cutting edge arranged parallel to the plane of movement of the vibratory part, said vibratory part being provided with a guard closing the slot in the casing and a cigar-receiving perforation the path of movement of which during the vibration of said part extends angularly across the cutting edge, substantially as described.

4. A cigar-cutter comprising an upright casing provided with a slot having closed ends, a pivoted lever normally held up, and a cutting-disk mounted upon an axis eccentric with respect to the axis of the lever, the lever being provided at its free end with a cigar-receiving socket working through said slot and located exterior to the cutting edge of the disk in the normal position of the lever but arranged to swing across said edge to sever the tip of an inserted cigar when the lever is oscillated, substantially as described.

5. A cigar-cutter comprising a vibratory part and a cutting-disk arranged parallel to the plane of movement of said vibratory part, the latter being provided with a cigar-receiving perforation the path of movement of which during the vibration of said part extends angularly past the cutting edge, and means operated by said vibratory part for giving intermittent rotary movement to the cutting-disk, substantially as described.

6. A cigar-cutter comprising a slotted casing, a vibratory part movable longitudinally of the slot in said casing, said vibratory part being provided with a cigar-receiving perforation, means for normally holding the vibrating part at one end of the slot, and a cutter within the casing with its cutting edge intersecting the path of movement of the cigar-receiving perforation, substantially as described.

7. A cigar-cutter comprising a slotted casing, a vibratory part movable longitudinally of the slot in said casing, said vibratory part being provided with a cigar-receiving perforation, a cutter within the casing with its cutting edge intersecting the path of movement of the cigar-receiving perforation, and means for moving the cutter to present new portions of its cutting edge to the cigar to be cut, substantially as described.

8. A cigar-cutter comprising a slotted casing, a vibratory part movable longitudinally of the slot in said casing, said vibratory part being provided with a cigar-receiving perforation, and a rotatable cutter within the casing with its cutting edge intersecting the path of movement of the cigar-receiving perforation, substantially as described.

9. A cigar-cutter comprising a slotted casing, a vibratory part movable longitudinally of the slot in said casing, said vibratory part being provided with a cigar-receiving perforation, a cutting-disk within the casing with its cutting edge intersecting the path of movement of the cigar-receiving perforation, and means for imparting rotary movement to said cutting-disk, substantially as described.

10. A cigar-cutter comprising a casing provided with a slot in one of its upright walls, a pivoted arm provided with a cigar-receiving socket swinging longitudinally of and working through the slot in said casing, and a cutter within the casing with its cutting edge intersecting the path of movement of the cigar-receiving socket, substantially as described.

11. A cigar-cutter comprising a slotted casing, a pivoted arm provided with a cigar-receiving perforation moving longitudinally of the slot in said casing as the pivot-arm is oscillated, and a cutting-disk within the casing arranged parallel to the pivoted arm and with its cutting edge intersecting the path of movement of the cigar-receiving perforation, substantially as described.

12. A cigar-cutter comprising a slotted casing, a pivoted arm provided with a cigar-receiving perforation moving longitudinally of the slot in said casing as the pivoted arm is oscillated, a cutting-disk within the casing arranged parallel to the pivoted arm and with its cutting edge intersecting the path of movement of the cigar-receiving perforation, and means for intermittingly rotating said cutting-disk, substantially as described.

13. A cigar-cutter comprising a slotted casing, a pivoted arm provided with a cigar-receiving perforation movable longitudinally of the slot in said casing as the pivoted arm is oscillated, a cutting-disk within the casing with its cutting edge intersecting the path of movement of the cigar-receiving perforation, a ratchet-wheel secured to said cutting-disk, and a ratchet-pawl connected to and movable with the pivoted arm for intermittingly rotating said cutting-disk, substantially as described.

14. A cigar-cutter comprising a slotted casing, a vibratory part movable up and down in the slot in said casing, said vibratory part being provided with a cigar-receiving perforation and a projecting finger-piece adjacent to said perforation by which the part may be vibrated, means for normally holding up said vibrating part, and a cutter within the casing with its cutting edge intersecting the path of movement of the cigar-receiving perforation, substantially as described.

15. A cigar-cutter comprising a slotted casing, a vibratory part movable up and down in the slot in said casing, said vibratory part being provided with a cigar-receiving perforation and a projecting finger adjacent to said perforation by which the part may be vibrated, means for normally holding up said vibrating part, a cutter within the casing with its cutting edge intersecting the path of movement of the cigar-receiving perforation, and means carried by the vibrating part for closing said slot while the vibratory part is at rest.

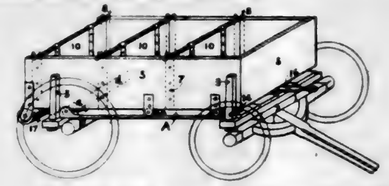
16. In a cigar-cutter, an upright casing provided with a slot in one of its walls, a cutter within the casing and in proximity to said slot, a part mounted on a wall of the casing adjacent to said slot and adapted to move up and down and carrying a cigar-receiving perforation coincident with said slot, this cigar-receiving perforation being adapted to cross the cutting edge when the movable part is depressed, and means for normally holding up the movable part.

17. In a cigar-cutter, an upright casing provided with a slot in one of its walls, a cutter within the casing and in proximity to said slot, a part mounted on a wall of the casing adjacent to said slot and adapted to move up and down and carrying a cigar-receiving perforation coincident with said slot, this cigar-receiving perforation being adapted to cross the cutting edge when the movable part is depressed, means for normally holding up the movable part, and a guard connected to the vibrating part and adapted to normally close said slot.

18. In a cigar-cutter, an upright stationary casing, a cutter carried thereby, a part mounted on a wall of the casing and adapted to move up and down and carrying a cigar-receiving perforation adapted on the downward movement of said part to cross said cutter edge and thereby sever the cigar-tip, and means for normally holding up said movable part.

709,210. **DUMPING-WAGON.** JOHN J. HAGEN, Oakland, Cal. Filed July 18, 1902. Serial No. 116,013. (No model.)

Claim.—1. The combination in a wagon, of a platform, a roller on the rear end thereof, a longitudinally-movable box resting on said roller and platform, forked bars carried on said box and engaging the stanchions of said wagon whereby the longitudinal movement of said box is limited, and connections of the inner ends of said forked bars with a lever whereby said bars may be operated in unison.



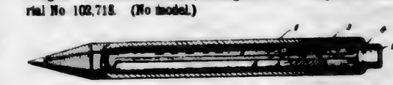
2. The combination in a wagon, of a platform, a fulcrum-roller, a box resting on said roller and platform, means including forked bars carried on the box and engaging the stanchions of the wagon, means for operating the forked bars, and a roller-bearing between the platform and box.

3. The combination in a dumping-wagon, of a platform, a box movable longitudinally on antifrictional bearings on said platform, slotted connections at the upper edge of the box and a door having a rod the ends of which are pivotally hung in said slotted connections, and locking means for said door including a vertically-reciprocable forked slide-bolt, and a lever pivoted on the door and engaging one end of said bolt.

4. In a wagon, a longitudinally-movable tilting box, transverse partitions and means whereby they are detachably hinged to the box, said partitions dividing the box into compartments, and independent locking means for each partition whereby any one or more of the partitions may be released without disturbing the others, substantially as described.

5. The combination in a wagon, of a box having double walls and bottom, U-shaped bands encircling the box between said wall and bottom sections, the ends of said bands slotted and projecting above the upper edge of the sides of the box, transverse rods supported at their ends in said slots, and doors hinged to said rods and movable in the space between the sides and bottom of the box and means for locking said doors.

709,211. **LIQUID-RECEPTACLE.** WALTER BLEAM, Chicago, Ill., assignor to Charles F. Cooke, Chicago, Ill. Filed Apr. 14, 1902. Serial No. 102,718. (No model.)



Claim.—1. In a device of the kind described, a case provided with a removable cap having an aperture formed therein, and a receptacle closely fitting within the case, in combination with a stopper for the receptacle adapted to be positioned within the case and cap, provided with an air-duct extending therethrough, a valve for the air-duct, a tube passing through the stopper, one end extending to a point near the bottom of the receptacle and the other to a point near the aperture in the cap, and a mouthpiece secured to the end of the tube and extending through the aperture.

2. In a device of the kind described, an inclosing case, provided with a cap adapted to be secured to the open end of the case and having an aperture 4, formed therein, in combination with a liquid-receptacle adapted to be positioned within the case and provided with a mouthpiece adapted to extend through the aperture 4 and a tube 8, extending from the mouthpiece to a point within the receptacle, substantially as described.

709,212. **PNEUMATIC PUMP.** RALPH W. ELLIOTT, Oakley, Cal. Filed Feb. 19, 1902. Serial No. 94,784. (No model.)

Claim.—1. The combination of vertical rigid air-inlet and water-outlet pipes, upper and lower horizontal guides extending between the said pipes and connected thereto at their ends, a tank, a rod extending vertically from said tank and slidably guided by said guides, a three-way valve in the air-inlet pipe communicating in one of its positions with the atmosphere, means actuated by said rod for operating the three-way valve, a rigid water-delivery pipe extending to the interior of the cylinder near the bottom thereof, a flexible pipe connection between said latter pipe and the vertical rigid water-outlet pipe, a flexible pipe connection between the air-inlet pipe and the upper end of the tank, and a check-valve in the water-delivery pipe, substantially as described.

2. In an apparatus of the character described, the combination of a tank having a valve-controlled opening in the bottom thereof to admit

water therein to, inflexible vertical compressed-air-inlet and water-outlet pipes, a rod attached to the tank, a guide for said rod flexibly carried upon said pipes, a pipe leading upward from the bottom of the cylinder for delivering the water to the water-outlet pipe, a flexible pipe connection between the two latter pipes, a flexible pipe connection between the top of the cylinder and the compressed-air-inlet pipe, and a three-way valve in said latter pipe opening in one position to the atmosphere and actuated by said rod in its vertical movement, substantially as described.

709,213. VEHICLE-AXLE. FRANCIS E. FISHER, Glen Arbor, Mich., assignor of one-half to Theodore C. H. Wegenarth, Chicago, Ill. Filed Dec. 5, 1901. Renewed Aug. 11, 1902. Serial No. 119,233. (No model.)

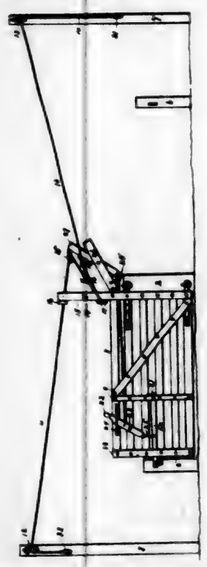
Claim.—1. A vehicle-axle comprising in combination, a fixed tubular housing having an enlarged circular outer end the periphery of which is offsetted to form a ball-race, a wheel-carrying arbor having a non-circular outer portion for engagement with a wheel-hub, a cylindrical body or bearing portion turning in the housing and an intermediate enlargement formed with an annular recess to constitute a companion ball-race, a series of interposed balls, and means for locking the parts against endwise disengagement, substantially as set forth.

2. A vehicle-axle comprising in combination, a fixed tubular housing having an enlarged circular outer end, a wheel-carrying arbor having a non-circular outer portion for engagement with a wheel-hub, a cylindrical body or bearing portion turning in the housing and an intermediate annular enlargement forming an end bearing, and means for locking the parts against endwise disengagement, the same comprising an annular groove in the bearing portion of the arbor, a semicircular block fitting said groove, and screw-bolt passing through the housing and engaging said block, substantially as set forth.

3. A vehicle-axle comprising in combination, a fixed tubular housing having an enlarged circular outer end, a wheel-carrying arbor having a non-circular outer portion for engagement with a wheel-hub, a cylindrical body or bearing portion turning in the housing and an intermediate annular enlargement forming an end bearing, and means for locking the parts against endwise disengagement, the same comprising an annular groove in the bearing portion of the arbor, a semicircular block fitting said groove and formed with a central tapering hole or cavity, and a screw-bolt passing through the housing and provided with a tapering point to engage the cavity of said block, substantially as set forth.

4. A vehicle-axle comprising in combination, a fixed tubular housing having an enlarged circular outer end, a filling-piece occupying the middle portion of the bore of such housing, a wheel-carrying arbor having a non-circular outer portion for engagement with a wheel-hub, a cylindrical body or bearing portion turning in the housing and an intermediate annular enlargement forming an end bearing, and means for locking the parts against endwise disengagement, substantially as set forth.

709,214. ROAD-GATE. ALEXANDER FRIESS, Elizabethtown, Ky., assignor of one-half to B. F. Collins, Elizabethtown, Ky. Filed Apr. 4, 1902. Serial No. 101,460. (No model.)



Claim.—1. In a road-gate, the combination of an upward extension of the hinge-stile and a rectangular, flat, line-deflecting frame the plane of which is vertical and at right angles to the plane of the gate secured on said upward extension, substantially as specified.

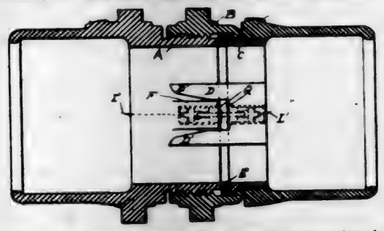
2. In a road-gate, the combination of an upright combined unlatching and gate-swinging lever, a rearwardly-extending bracket in which said combined unlatching and gate-swinging lever is housed and pivoted, and pulleys, adapted to receive operating-lines, secured to the upper end of said combined unlatching and gate-swinging lever, substantially as specified.

3. In a road-gate, the following combination: a line-deflecting frame on the upward extension of the hinge-stile, the two lines 10 and 11 attached one to each side of said line-deflecting frame, the upright unlatching and gate-swinging lever 27, the pulleys 14 and 15 secured near the upper end of said lever 27, the rearwardly-extending bracket 26, the wire 28 for transmitting motion from lever 27 to lever 22, the hasp latch lever 22 pivoted on bolt 23 on one of the upper rails of the gate, and the link 25 communicating between lever 22 and latch 20, all substantially as and for the purposes specified.

709,215. FENCE. GEORGE GOTTSLEBEN, Wapakoneta, Ohio. Filed May 4, 1901. Serial No. 58,702. (No model.)

Claim.—In a fence, the combination with a series of panels disposed at an angle to each other, each panel comprising uprights and horizontal rails connecting the uprights, of elongated links having parallel upper and lower members, one of said members being cut away at the center, each link having one member resting upon horizontal rails of adjacent panels and bearing against the uprights of said panels above the horizontal rails thereof, and the other member of the link disposed under said horizontal rails of adjacent panels and also bearing against the uprights of said panels below the point where the first-mentioned member of the link bears against the uprights.

709,216. ELECTRIC HOSE-COUPLING. MARION C. GOODWIN, Portland, Me. Filed Jan. 2, 1902. Serial No. 88,174. (No model.)



Claim.—1. An electric hose-coupling, in combination, male and female members, one provided with blocks, the other with posts, contact-points in said blocks and between said posts and means for surrounding said contact-points for preventing the grounding of an electric current.

2. In an electric hose-coupling, in combination, male and female members, the one provided with blocks, the other with tapering posts, the distance between said tapering posts at their bases being equal to the greatest width of the tapering block, contacts insulated from the couplings inserted in said blocks and between said posts and means for preventing moisture from reaching said contacts.

3. In an electric hose-coupling, in combination, male and female members, means for preventing said members from having any movement whatever one upon the other, contacts situated in each member and insulated therefrom and means for preventing moisture from reaching said contact-points.

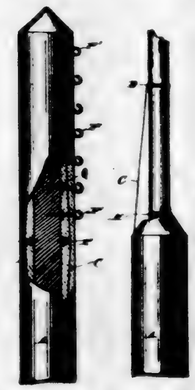
4. In an electric hose-coupling, in combination, male and female members provided respectively with means for preventing the slipping of one part upon the other when being set up, contacts in each of said members, said contacts being inclosed in a non-conductive cylinder, the head of said cylinder being provided with a raised rim.

5. In an electric hose-coupling, a contact consisting of a casing of non-conductive material, a cap on the upper end of said cylinder, a contact-rod running through said cap, a spring-contact attached to a conductor, in the bottom of said cylinder and means for bringing a flexible conductor into said casing so that an uninterrupted current may be maintained through said cylinder, said cap being provided with a rim on its outer edges.

6. In an electric hose-coupling, in combination, male and female members, a plurality of blocks in the one and plurality of double posts in the other, electrical contacts insulated from said members situated in said blocks and between said double posts, said contact having on its head a raised insulated rim.

7. In an electric hose-coupling, in combination, a male member with a plurality of blocks attached to the inner periphery thereof, a female member, a flange therein, a plurality of double posts attached thereto, electrical contacts in the blocks and between the double posts, the contact-points being surrounded by an insulated cap provided with a raised rim which rim is adapted to sink into a gasket resting on the flange in the female member when the members of the coupling are set up.

709,217. POST FOR FENCING OR OTHER PURPOSES. ROBERT H. GUTHRIE, South Dumfries, Canada. Filed Jan. 8, 1902. Serial No. 88,885. (No model.)



Claim.—1. In a fence-post, the combination of an outer casing of cement, a post embedded therein, truss-wires attached to said post and running lengthwise of the same from end to end thereof, a series of brackets secured to said post and extending out through said casing of cement, the outer ends of said brackets being provided with means whereby a fence may be attached thereto, substantially as described.

2. In a fence-post, the combination of an outer casing of cement, a post embedded therein, truss-wires attached to said post and running lengthwise of the same from end to end thereof, a series of brackets secured to said post and extending out through said casing of cement, the outer ends of said brackets being provided with hooks adapted to be closed when fencing-wires have been placed therein, substantially as described.

3. In a post for fencing or other purposes, the combination of an outer casing of cement, a post set therein, truss-wires attached to said post and running lengthwise of the same from the bottom upward, said casing of cement enveloping the lower portion of said post and the truss-wires attached, and extending upward to a point intermediate the ends of said post, all substantially as described.

4. In a post for fencing or other purposes, the combination of an outer casing of cement, a post set therein, truss-wires attached to said post and running lengthwise of the same from the bottom upward, said casing of cement enveloping the lower portion of said post and the truss-wires attached and extending upward to a point intermediate the ends of said post, said post having a groove about it circumferentially at the uppermost point reached by said casing of cement, said casing of cement covering said groove and entering into it for the purpose of producing a water-tight joint between said post and said casing of cement, substantially as described.

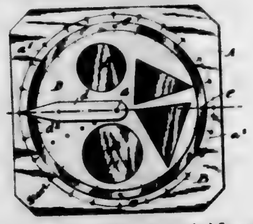
5. In a post for fencing or other purposes, the combination of an outer casing of cement, a post set therein, truss-wires attached to said post and running lengthwise of the same from the bottom upward, said casing of cement enveloping the lower portion of said post and the truss-wires attached, and extending upward to a point intermediate the ends of said post, the upper portion of said cement casing being protected by a covering of sheet metal, all substantially as described.

709,218. PROCESS OF MELTING NICKEL. HARRY L. HAAS, New York, N. Y., assignor to Baxter & Lovett & Loeb Company, New York, N. Y., a Corporation of New York. Filed Apr. 17, 1901. Serial No. 56,186. (No specimens.)

Claim.—1. The continuous process of melting and refining nickel containing carbon, consisting in subjecting a column of a mixture of nickel in granular form directly with fuel to heat generated from said fuel; passing large quantities of air under excessive pressure upwardly through the entire column of nickel and fuel, to assure a temperature above the melting-point of nickel, and to oxidize the carbon in the nickel; allowing the melting nickel to flow downwardly through the mass and in contact with the air, drawing off the melted nickel with more or less continuity below the column; and supplying fuel and granular nickel as necessary to the top of the column to maintain the temperature and to continue the process, substantially as described.

2. The continuous process of melting and refining nickel containing carbon, consisting in subjecting a column of a mixture of nickel in granular form directly with fuel to heat generated from said fuel; then passing large quantities of air under excessive pressure upwardly through the entire column of nickel and fuel, to assure a temperature above the melting-point of the nickel, and to oxidize the carbon in the nickel; allowing the melting nickel to flow downwardly through the mass and in contact with the air, and drawing off the melted nickel with more or less continuity below the column, substantially as described.

709,219. **DRAFTING DEVICE.** WILLIAM F. HOCHSTEIN, Jersey City, N. J., assignor of one-half to John H. Greif and Louis H. Greif, Jersey City, N. J. Filed Jan. 25, 1902. Serial No. 91,263. (No model.)



Claim.—1. A device for drafting geometrical figures, consisting of a base-plate provided with a center pin and pointed pins equidistant from said center pin, a rotary disk provided with a center opening and with openings of different sizes and shapes in the body of the disk, a pointer on said disk, and a graduated circle arranged on said base-plate beyond the edge of said disk, substantially as set forth.

2. A device for drafting geometrical figures, consisting of a base-plate provided with a center pin and a circle concentric with the axis of said pin, a rotary disk provided with a projecting index at one point of said disk and with openings of different sizes and shapes, and a plurality of pins projecting upwardly from said base-plate, substantially as set forth.

3. A device for drafting geometrical figures, consisting of a base-plate provided with a projecting center pin, a plurality of pins provided on the surface of said base-plate, a graduated circle concentric with the axis of the center pin, and a rotary disk provided with a pointer at one point of its circumference and with a number of openings of different sizes and shapes, substantially as set forth.

4. A device for drafting geometrical figures, consisting of a base-plate provided with a graduated circle, a centrally-guided disk provided with plotting-openings of different sizes and shapes, a pointer on said disk adapted to move with the disk along the graduated circle, and means for holding a sheet of paper stationary on the base-plate, substantially as set forth.

709,220. **METAL PLINTH-BLOCK.** JOHN J. HOULIHAN, Chicago, Ill. Filed Jan. 20, 1902. Serial No. 90,286. (No model.)

Claim.—The combination with a house-wall, a riser therein and a horizontal pipe which passes through an opening in the wall and is attached to the riser, of a hollow metal plinth-block which extends over the opening in the wall and is provided with a vertically-elongated slot through which the said horizontal pipe passes and with an inwardly-extending horizontal top flange and inwardly-extending vertical side flanges provided with marginal, laterally-extending attaching-flanges a movable plate mounted in the inner face of the plinth-block and provided with an aperture to receive said horizontal pipe said plate being adapted to slide freely in a vertical direction on the plinth-block so that it may rise and fall with the said pipe.

709,221. **FOLIO-HOLDER.** DAVID E. HUNTER, Cambridge, Mass., assignor to Library Bureau, Boston, Mass., a Corporation of Massachusetts. Filed Dec. 16, 1901. Serial No. 86,006. (No model.)

Claim.—1. The combination, in a drawer, of a hinged cover-board, and a securing device therefor consisting of a pawl, a rack therefor, a track, a pawl-shoe running in the track and adapted by contact therewith to hold the pawl away from the rack as the cover-board is closed, substantially as described.

2. The combination, in a drawer, of a hinged cover-board, and a securing device therefor consisting of a pawl, a rack therefor, a pawl-spring, normally urging the pawl toward the rack, a track, a pawl-shoe running in the track and adapted by contact therewith to hold the pawl away from the rack as the cover-board is closed, substantially as described.

3. The combination, in a drawer, of a hinged cover-board, and a securing device therefor consisting of a pawl loosely pivoted to the cover-board, a rack therefor, a track, a pawl-shoe running in the track, and adapted by contact therewith to hold the pawl away from the rack as the cover-board is closed, substantially as described.

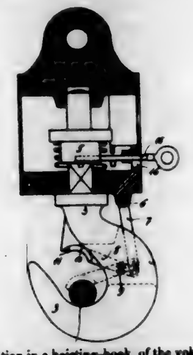
4. The combination, in a drawer, of a hinged cover-board, and a securing device therefor consisting of a pawl loosely pivoted to the cover-board, a rack therefor, a pawl-spring, normally urging the pawl toward the rack, a track, a pawl-shoe running in the track and adapted by contact therewith to hold the pawl away from the rack as the cover-board is closed, substantially as described.

5. The combination, in a folio-holder, of a cover-board, a hinge-plate thereon, articulately joined to a sliding block, said block perforated to slide on a rod, the rod, a clutch-block pendent from the sliding block upon a binding-screw, and located between the slide-rod and an incline formed upon the sliding block, substantially as described.

709,222. **HOISTING DEVICE.** PAUL JABLOSOWSKY, Hamburg, Germany. Filed Feb. 15, 1902. Serial No. 94,292. (No model.)

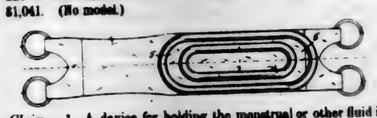
Claim.—1. The combination in a hoisting-hook, of the yoke, the spring-seated hook having a stop on its shank, the pivoted retaining-catch, and the link connecting the yoke and the heel end of said retaining-catch, whereby said catch is opened and closed by the rising and falling of the hook.

2. The combination in a hoisting-hook, of the yoke, the spring-seated hook, having a stop on its shank, the locking-latch with which said stop engages, when the hook is depressed, the retaining-catch pivoted to the hook and playing in a slot therethrough, and the link connecting the heel of said catch to the yoke.



3. The combination in a hoisting-hook, of the yoke, the spring-seated hook, the stop upon its shank, the locking-latch urged against said stop by a spring and engaging over its upper end when the hook is depressed, the registering apparatus arranged in such relation to the latch and to a keyhole that the latch may be released and the register operated by a key acting concurrently upon both, the retaining-catch pivoted to the hook, and the link connecting the heel of said catch to the yoke.

709,223. **CATAMENIAL BANDAGE.** JOHN F. JAMES and ROBERT M. KIPPEN, Melbourne, Canada. Filed Nov. 4, 1901. Serial No. 81,041. (No model.)



Claim.—1. A device for holding the menstrual or other fluid in the vagina, consisting of a base provided with two ribs consisting of pneumatic tubes, one rib shaped to press the external labia together and the other covering the remainder of the vulva and extending back on the perineum, substantially as and for the purpose set forth.

2. A device for holding the menstrual or other fluid in the vagina, consisting of a base provided with two concentric oval ribs forming an inner concavity and an annular surrounding concavity for the purposes described; in combination with means for securing the same in position on the body of the wearer, substantially as and for the purposes set forth.

709,224. **FENCE-POST.** WILLIAM B. JOHNSON, Van Wert, Ohio. Filed Apr. 19, 1902. Serial No. 103,782. (No model.)

Claim.—1. A post of plastic material provided with a support consisting of a continuous cable of twisted strands and composed of upright portions arranged at the sides and center of the post, the central upright portion being provided with horizontal arms formed by extending and twisting the strands of the cable and provided at their outer ends with eyes arranged on the exterior of the post, substantially as described.

2. A post of plastic material provided with a support consisting of a continuous cable and composed of upright center and corner portions and short connecting portions, substantially as described.

3. A post of plastic material provided with a support consisting of a continuous cable and composed of upright central and corner portions, a short diagonal connecting portion extending from the central upright portion to one of the corner portions, the approximately parallel top connecting portions arranged at the front and back of the post and connecting the upper ends of the upright corner portions, and the bottom connecting portion arranged at one side of the post and extending from the lower end of one of the front corner portions to the lower end of the adjacent rear corner portion, substantially as described.

4. A post of plastic material provided with a support consisting of a continuous cable of twisted strands of wire and composed of upright central and corner portions, the short diagonally-arranged connecting portion 6 extending from the central upright portion to one of the corner portions, the side connecting portion 10 arranged at one side of the post and extending from one corner portion to the adjacent corner portion, the parallel connecting portions 8 and 12, arranged at the front and back of the post and the arms extending from the central portion of the support and provided at their outer ends with eyes arranged on the exterior of the post, substantially as described.

709,225. **PAPER-RULING MACHINE.** WILLIAM H. JORDAN, Brooklyn, N. Y. Filed May 10, 1902. Serial No. 106,758. (No model.)

Claim.—1. In a ruling-machine, the combination with a horizontal feeding-belt, of a reciprocating pen-beam for producing wave-lines, a heater for drying the ink, a horizontal conveyer in alinement with the feeding-belt receiving the inked sheets from the feeding-belt and carrying same over the heater, a lay-boy, and a second conveyer for delivering the paper sheets to the lay-boy, substantially as set forth.

2. In a ruling-machine, the combination with a horizontal feeding-belt, of a reciprocating pen-beam for producing wave-lines, a heater for drying the ink, a horizontal string conveyer in alinement with the feed-

ing-belt receiving the inked sheets from the feeding-belt and carrying same over the heater, a lay-boy, and a second conveyer for delivering the paper sheets to the lay-boy, substantially as set forth.

3. In a ruling-machine, the combination with a feeding-belt, of a reciprocating pen-beam for producing wave-lines, a heater for drying the ink, a conveyer receiving the inked sheets from the feeding-belt and carrying same over the heater, a lay-boy, a second conveyer for delivering the paper sheets to the lay-boy, and a transferring-conveyer for dropping the paper sheets from the first conveyer to the second conveyer with the inked sides upward, substantially as set forth.

4. In a ruling-machine, the combination with a feeding-belt, of a reciprocating pen-beam for producing wave-lines, a heater for drying the ink, a string conveyer receiving the inked sheets from the feeding-belt and carrying same over the heater, a lay-boy, a second conveyer for delivering the paper sheets to the lay-boy, and a transferring-conveyer for dropping the paper sheets from the first conveyer to the second conveyer with the inked sides upward, substantially as set forth.

5. In a ruling-machine, the combination with a feeding-belt, of a reciprocating pen-beam for producing wave-lines, a lay-boy for receiving the inked sheets, a conveyer for delivering said sheets to the lay-boy, and a transferring device for dropping the sheets to said conveyer with the inked sides upward, substantially as set forth.

6. In a ruling-machine, the combination with a feeding-belt, of a reciprocating pen-beam for producing wave-lines, a lay-boy for receiving the inked sheets, a conveyer for delivering said sheets to the lay-boy, and a transferring device consisting of a divided conveyer which allows the sheets to sag and drop through to the first-named conveyer with the inked sides upward, substantially as set forth.

7. In a ruling-machine, the combination with a feeding-belt, of a reciprocating pen-beam for producing wave-lines, a lay-boy for receiving the inked sheets, a conveyer for delivering said sheets to the lay-boy, and a transferring device consisting of two string conveyers set at an angle to each other and presenting a wide opening through which the sheets sag and drop to the first-named conveyer with the inked sides upward, substantially as set forth.

8. In a ruling-machine, the combination with a feeding-belt, of a reciprocating pen-beam for producing wave-lines, a heater for drying the ink, a conveyer receiving the inked sheets from the feeding-belt and carrying same over the heater, a lay-boy, a second conveyer for delivering the paper sheets to the lay-boy, and a transferring device consisting of a divided conveyer which allows the sheets to sag and drop through to the second conveyer, with the inked sides upward, substantially as set forth.

9. In a ruling-machine, the combination with a feeding-belt, of a reciprocating pen-beam for producing wave-lines, a heater for drying the ink, a conveyer receiving the inked sheets from the feeding-belt and carrying same over the heater, a lay-boy, a second conveyer for delivering the paper sheets to the lay-boy, and a transferring device consisting of two string conveyers set at an angle to each other and presenting a wide opening through which the sheets sag and drop to the first-named conveyer with the inked sides upward, substantially as set forth.

10. In a paper-ruling machine, the combination with the paper feeding and ruling mechanism, the lay-boy, and the conveyer for delivering the ruled sheets to the lay-boy, of a transferring device consisting of a divided conveyer which allows the sheets to sag and drop through to said conveyer with the ruled sides upward, substantially as set forth.

11. In a paper-ruling machine, the combination with the paper feeding and ruling mechanism, the lay-boy, and the conveyer for delivering the ruled sheets to the lay-boy, of a transferring device consisting of two string conveyers set at an angle to each other and presenting a wide opening through which the sheets sag and drop to said conveyer with the ruled sides upward, substantially as set forth.

12. In a ruling-machine, the combination with several conveyers for the paper sheets, of a device for transferring the sheets from one conveyer to the other without turning the sheets over, consisting of two short conveyers separated so as to permit the sheets to sag in the middle and drop through, and an adjustable stop for checking the forward feed of the sheets on said conveyers, substantially as set forth.

13. In a ruling-machine, the combination with several conveyers for the paper sheets, of a device for transferring the sheets from one conveyer to the other without turning the sheets over, consisting of two short conveyers set at an angle to each other and presenting a wide opening so as to permit the sheets to sag in the middle and drop through, and an adjustable stop for checking the forward feed of the sheets on said conveyers, substantially as set forth.

14. In a ruling-machine, the combination with several conveyers for the paper sheets, of a device for transferring the sheets from one conveyer to the other without turning the sheets over, consisting of two short string conveyers traveling over two pairs of rollers set at an angle so as to present a V-shaped opening between them and permit the sheets to sag in the middle and to a greater extent at one end and drop through on a slant, and an adjustable stop for checking the forward feed of the sheets on said conveyer, substantially as set forth.

15. In a ruling-machine, the combination with the pen-beam, of a horizontally and vertically adjustable stationary bearing therefor at one end, a similarly-adjustable reciprocating bearing therefor at the other end, means for securing said pen-beam in its adjusted position both with respect to the paper to be ruled and to said reciprocating bearing, and means for imparting the reciprocating motion to said bearing, substantially as set forth.

16. In a ruling-machine, the combination with the pen-beam, of a horizontally and vertically adjustable stationary bearing therefor at one end, a similarly-adjustable reciprocating bearing therefor at the other end, means for securing said pen-beam in its adjusted position both with respect to the paper to be ruled and to said reciprocating bearing, an eccentric connected with said bearing, and a driving-gear for said eccentric whereby the reciprocating motion is imparted to said bearing, substantially as set forth.

17. In a ruling-machine, the combination with the paper-feeding mechanism and the conveyers, of two independently-reciprocating pen-beams for producing wave-lines, means for reciprocating said beams, and means for independently adjusting the movements of said beams, substantially as set forth.

18. In a ruling-machine, the combination with the paper-feeding mechanism and the conveyers, of two independently-reciprocating pen-beams for producing wave-lines, a stationary adjustable bearing for each of said beams, an adjustable reciprocating bearing for each beam, means for securing said beams in their adjusted positions both with respect to the paper and to said reciprocating bearings, and means for imparting the reciprocating motion to said bearings, substantially as set forth.

19. In a ruling-machine, the combination, with the paper-feeding mechanism and the conveyers, of two independently-reciprocating pen-beams for producing wave-lines, a horizontally and vertically adjustable stationary bearing for each of said beams, a similarly-adjustable reciprocating bearing for each beam, means for securing said beams in their adjusted positions both with respect to the paper and to said reciprocating bearings, and means for imparting the reciprocating motion to said bearings, substantially as set forth.

20. In a ruling-machine, the combination with the paper-feeding mechanism and the conveyers, of two reciprocating pen-beams for producing wave-lines, a stationary bearing for each of said beams, a reciprocating bearing for each beam, means for securing said beams in their adjusted positions and to said reciprocating bearings, an eccentric connected with each of said reciprocating bearings, and driving mechanism for said eccentrics, whereby the reciprocating motion is imparted to said bearings, substantially as set forth.

21. In a ruling-machine, the combination with the paper-feeding mechanism and the conveyers, of two reciprocating pen-beams for producing wave-lines, an adjustable stationary bearing for each of said beams, an adjustable reciprocating bearing for each beam, means for securing said beams in their adjusted positions and to said reciprocating bearings, an eccentric connected with each of said reciprocating bearings, and driving-mechanism for said eccentrics, whereby the reciprocating motion is imparted to said bearings, substantially as set forth.

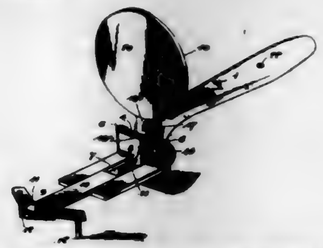
22. In a ruling-machine, the combination with the paper-feeding mechanism and the conveyers, of two reciprocating pen-beams for producing wave-lines, a stationary bearing for each of said beams, a reciprocating bearing for each beam, means for securing said beams in their adjusted positions and to said reciprocating bearings, driving mechanism for said eccentrics, whereby the reciprocating motion is imparted to said bearings, and means for varying the reciprocations of said beams, substantially as set forth.

709,226. BLACKING-BOX HOLDER. GEORGE A. JOY, Bar Harbor, Me. Filed Sept. 23, 1901. Serial No. 76,254. (No model.)

Claim.—1. A box-holder comprising a slotted handle, a cover hinged thereto and adapted to serve as a guard when raised, and a spring supported by the handle and operatively connected with the cover to maintain the latter in its lowered or raised positions, the end wall of the handle-slot forming a stop for limiting the opening movement of the cover, substantially as described.

2. A box-holder comprising a handle, a cover-carrying arm attached at a point intermediate of its length to said handle by a hinged joint, a cover or lid carried by said arm, and a leaf-spring attached to the handle and acting against the short end of said cover-arm, for the purpose described, substantially as set forth.

3. A box-holder comprising a slotted handle, an extensible box-clamp carried thereby, a cover-carrying arm pivoted to said handle at a point intermediate of its length, a cover carried by said arm, and a spring carried by the handle and operatively connected with said arm to maintain the cover in its lowered or raised position, the end wall of the handle-slot forming a stop for limiting the opening movement of the cover, substantially as specified.



4. The combination with a handle and a cover supported thereby, of a box-clamp attached to the handle for adjustment thereon toward or from the cover, substantially as described.

5. In a box-holder, the combination with a handle and a cover, of an extensible box-clamp adjustably fitted to the handle to be moved thereon toward or from the cover whereby the clamp may be adjusted to accommodate boxes which may vary in diameter and depth, substantially as described.

6. In a box-holder, the combination with a handle and a cover, of a two-part box-clamp having its members extensibly fitted together and with one member fitted adjustably to the handle, and a single clamping device by which the box-clamp may be firmly held in its adjusted position on the handle and its members extended or contracted as desired, substantially as described.

7. In a box-holder, the combination with a handle and a cover, of a two-part box-clamp having one member adjustably fitted to the handle, and a clamp for holding the box-clamp in its adjusted position on the handle, substantially as described.

8. In a box-holder, a box-clamp consisting of a T-shaped carrier-plate provided with a guideway and a clamping-plate slidably fitted in the guideway and provided with a box-engaging face, in combination with a handle to which the T-shaped carrier-plate of the box-clamp is fitted, and a clamping-screw connected to the handle and having an adjustable connection with the clamping-plate, substantially as described.

9. In a box-holder, the combination with a handle, of a hinged cover, and a box-clamp fitted to the handle for adjustment thereon toward or from the hinge of said cover, and means for firmly holding the box-clamp in its adjusted position on the handle, substantially as described.

10. In a box-holder, the combination of a handle provided with a slotted end piece, a two-part box-clamp having its members extensibly fitted together, and with one member slidably fitted to said end piece, a single screw fitted to the handle and adjustably connected with the extensible member of the box-clamp, and a cover pivoted to the handle above the limit of adjustment of the box-clamp thereon, substantially as described.

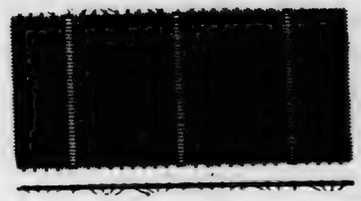
709,227. WOOL-WASHING MACHINE. JOHN KEEFE, San Francisco, Cal. Filed May 20, 1902. Serial No. 108,204. (No model.)

Claim.—1. The combination in a wool-washing machine of water-containing tanks, endless traveling inclined belts moving parallel and contiguous to each other, extending from the bottom of the receiving to the top of the discharge end of the tank, the uppermost belt having teeth or bars to engage and carry the wool between the two belts and having its upper end extending beyond the corresponding end of the lower belt to allow its teeth to shed the wool by gravity.

2. The combination in a wool-washing machine of water-containing tanks, endless traveling belts having their contiguous surfaces traveling in the same direction from the bottom of the receiving to the upper and discharge end of the tank, the uppermost belt having teeth or bars to engage and carry the wool forward, the drums of said uppermost belt being set in advance of those of the lower belt, whereby space is provided to receive the wool at the bottom and to allow the teeth or bars to shed the wool by gravity at the discharge end.

3. The combination in a wool-washing machine of water-containing tanks, endless traveling belts having their contiguous surfaces movable in the same direction from the bottom and receiving to the upper and discharge end of the tank, carriers fixed upon the uppermost belt, means whereby the wool is caused to pass between the belts at the receiving end and is discharged and disengaged therefrom at the upper end, said upper carrier having its discharge end in advance of the corresponding end of the lower carrier whereby the teeth or bars of said upper carrier shed the wool by gravity at a point beyond the discharge end of the lower carrier, transmitting-rollers upon which the wool is delivered, squeezing-rollers between which it is passed and pickers over which it is subsequently passed and from which it is delivered into the succeeding tank.

709,228. WIRE-CLOTH FOR PAPER-MACHINES. RUDOLF KROH, Jr., Golsern, Germany. Filed June 13, 1902. Serial No. 111,456. (No model.)



Claim.—A metallic wire or sieve for paper-making purposes into which wire or sieve metal strips are woven in longitudinal direction to form breadth of paper and between said strips metallic threads are woven in longitudinal direction to divide said breadth into small bands or ribbons.

709,229. DIAMOND-CUTTING TOOL. ROBERT MARY, Cincinnati, Ohio. Filed Apr. 26, 1902. Serial No. 104,767. (No model.)

Claim.—1. A diamond-cutter's dop having a circular recess or socket in the upper portion thereof, a rotatory disk within said socket carrying at a point other than its center the stem of said dop, substantially as set forth.

2. A diamond-cutter's dop having a circular recess or socket in the upper portion thereof, a rotatory disk within said socket carrying at a point other than its center the stem of said dop and means for securing said disk in place, substantially as set forth.

3. In a diamond-cutter's dop the combination of a socket in the upper portion thereof, a pivot fixed in the center of said socket parallel to the axis thereof, a disk or wheel revolving thereon carrying the stem of said dop, offsets diametrically opposite in the rim of said socket and a pin protruding from the circumference of said disk, substantially as set forth.

4. In a diamond-cutter's dop the combination of a socket in the upper portion thereof, a pivot fixed in the center of said socket parallel to the axis thereof, a disk or wheel revolving thereon carrying the stem of said dop, offsets diametricallly opposite in the rim of said socket and a pin protruding from the circumference of said disk, and a diamond-holder fixed to said dop by being screwed therein, substantially as set forth.

709,280. **VENTILATOR.** JAMES W. MAUS, Pacific Junction, Iowa. Filed June 14, 1900. Serial No. 20,311. (No model.)

Claim.—As a new article of manufacture, a window-sash ventilator comprising a box or casing 3 having open sides and inclined top and bottom walls adapted to extend entirely through an opening in a sash and rest flush with the inner and outer surfaces thereof, separable securing-flanges 4 adapted to engage with the edges of the top and bottom end end walls to hold the box from lateral movement, the edges of said flanges being level or flush with the inner surfaces of the box or casing to permit the free flow of water from the interior of the box, a foraminous shield 6 secured over the outer open side of the box by one of the flanges, a damper-plate 7 having longitudinally-alined pivot-pins or journals 8 arranged adjacent to the upper edge of the plate, there being perforations or recesses 9 formed in the end walls of the box for the reception of said pivot-pins, said damper being situated wholly within the box and when in closed position being inclined in the same direction but at a greater angle to the horizontal than the bottom wall of the casing and adapted to shed water, the lower edge of said damper when closed being in intimate contact with the lower wall of the casing to prevent the passage of water, an adjustable handle hinged to the damper and provided on its under side with a series of notches, and a keeper carried by the lower wall of the casing and adapted to engage in said notches, substantially as specified.

709,281. **MEASURING-MACHINE FOR ROLLED GOODS.** HENRY R. HEARN, Greeneville, Tenn., assignor of one-half to Jonathan Logan Wood, Greeneville, Tenn. Filed Oct. 29, 1901. Serial No. 80,389. (No model.)

Claim.—1. In a rolled-goods-measuring machine, the combination with a frame, of a winding device including a rotatable and endwise-adjustable operating-shaft having clamping-jaws to embrace one end of a bolt-board, and means for drawing the clamping-jaws together by an endwise adjustment of the shaft.

2. In a rolled-goods-measuring machine, the combination with a rotatable shaft mounted upon the frame and having a screw-threaded portion, and clamping-jaws, of an adjusting-nut fitted to the screw-threaded portion of the shaft and bearing against the frame, and means for drawing together the clamping-jaws by an endwise movement of the shaft under the action of the adjusting-nut.

3. In a rolled-goods-measuring machine, the combination with a frame, of a winding device embodying a rotatable endwise-shiftable shaft having diverged clamping-jaws at one end thereof, a head loosely fitted upon the shaft adjacent to the inner ends of the clamping-jaws, and means to adjust the shaft in an endwise direction to draw the jaws into frictional engagement with the opening in the head and thereby draw the jaws together.

4. In a rolled-goods-measuring machine, the combination with a frame, of a winding device embodying an endwise-adjustable and rotatable operating-shaft journaled in the frame, and provided at one end with divergent clamping-jaws, a head loosely mounted upon the jaw end of the shaft for frictional engagement with the jaws, and means for adjusting the shaft in an endwise direction to draw the head into engagement with the frame and to draw the jaws into frictional engagement with the opening in the head and thereby to draw the jaws together.

5. In a rolled-goods-measuring machine, the combination with a frame having an upright, of a winding device embodying a bearing carried by the upright and having an enlarged inner end, a rotatable and endwise-adjustable shaft mounted in the bearing and having a screw-threaded portion projected at the outer side of the upright, and divergent spring clamping-jaws at the inner end of the shaft and located at the inner side of the upright, means for rotating the shaft, a head loosely fitted to the inner end portion of the shaft, and an adjusting-nut fitted to the projected screw-threaded portion of the shaft and bearing against the outer side of the upright.

6. In a rolled-goods-measuring machine, the combination with a frame comprising a bottom and opposite uprights, one of which uprights is provided with a socket in its inner face, of a winding device comprising a rotatable and endwise-adjustable operating-shaft piercing the upright at the center of the socket therein and having its inner projected end provided with divergent clamping-jaws, a head slidably carried by the inner end of the shaft and adapted to be seated in the socket flush with the inner face of the upright, means for adjusting the shaft in an endwise direction to draw the clamping-jaws into frictional engagement with the head and thereby to draw the jaws together, an opposite rotatable head having clamping-jaws, and a bracket rotatably supporting the head and adjustable toward and away from the first-mentioned head.

7. In a rolled-goods-measuring machine, the combination with a frame embodying a base having a longitudinal groove formed in the upper face and at one side of the center thereof, and opposite end uprights, one of which uprights is provided with an opening registering with the adjacent end of the groove, of a receptacle to loosely contain a roll of goods located opposite the groove, a measuring-roll journaled in the upper portions of the uprights, an indicating device carried by one of the uprights and in operative relation to the measuring-roll, a feed-screw journaled in the groove of the base, a bracket inserted through the opening in one of the uprights and having a foot provided with a screw-threaded opening receiving the feed-screw, a rotatable head journaled upon the bracket, and provided with a pair of clamping-jaws, a rotatable endwise-adjustable winding-shaft piercing the other upright and having its outer projected end screw-threaded, divergent spring clamping jaws carried by the inner end of the shaft, a head slidably carried by the inner end of the shaft, an adjusting-nut fitted to the screw-threaded portion of the shaft and bearing against the outer side of the adjacent upright, the outer ends of the shaft and the feed-screw being made polygonal, and an operating-crank for detachable application to the polygonal ends of the winding-shaft and the feed-screw.

709,282. **CIRCUIT-BREAKER.** FRANK A. MERRICK, Johnstown, Pa., assignor, by mesne assignments, to Westinghouse Electric and Manufacturing Company, Pittsburg, Pa., a Corporation of Pennsylvania. Filed Mar. 21, 1900. Serial No. 9,537. (No model.)

Claim.—1. In a circuit-breaker, a chamber of insulating material, a fixed contact extending into said chamber through a wall thereof, a loosely-mounted shaft extending through said chamber and carrying a cooperating contact, a handle for manually actuating said shaft in one direction, a spring for actuating the shaft in an opposite direction, and an electromagnetically-controlled latch device for normally restraining the action of said spring, the magnet of said device having extended pole-pieces which embrace the said chamber to produce a magnetic field therein.

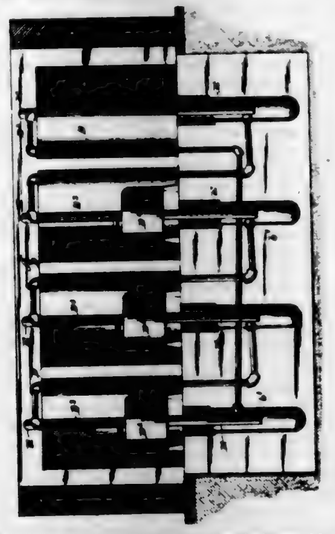
2. In a circuit-breaker, the combination of a fixed contact, a movable contact, a shaft to which the movable contact is fixedly secured, said shaft having two arms or projections thereon, a handle loosely sleeved on said shaft between the said arms or projections, and arranged upon movement to engage one or the other thereof, a spring interposed between the said handle and one of the arms or projections, a latch engaging the said handle, a spring for actuating said handle when the latch is released, and electromagnetic means for releasing said latch.

3. In a circuit-breaker, the combination of a pair of separable cooperative contacts, a shaft, a sleeve secured to said shaft and insulated therefrom, one of the contacts being fixedly secured to said sleeve, and a bearing in which said sleeve is journaled, said bearing forming a part of the circuit through the instrument.

4. In a circuit-breaker, the combination with a pair of separable cooperative contacts, of an inclosure therefor formed of insulating material, and having a separable portion closing its lower end, together with means for producing a magnetic field within said inclosure.

5. In a circuit-breaker, the combination with a pair of separable cooperative contacts, an inclosure of insulating material inclosing said contacts at the sides and underneath the same, and formed in separable upper and lower sections, and a shaft extending through the lower of said sections and carrying the same and also the movable contact.

709,283. **LIQUID DISTRIBUTING OR DOSING TANK AND MECHANISM.** SIDNEY W. MILLER, Chicago, Ill. Filed Jan. 6, 1902. Serial No. 88,514. (No model.)



Claim.—1. An apparatus for the purpose set forth comprising a liquid tank or receptacle, means acting severally to empty said tank or receptacle comprising siphons located therein, chambers associated with the siphons, and means controlled by the presence of liquid in said chambers, prior to the passage of said liquid through the siphons, for bringing said siphons into operation in a predetermined rotative order.

2. An apparatus for the purpose set forth comprising a tank or receptacle, a plurality of siphons acting severally to empty said tank, a series of chambers which are severally associated with said siphons and filled from the source supplying liquid to the tank, means operated by the filling of each chamber for transmitting pressure to the siphon associated with another chamber of the series to start the same into action, and means for emptying each chamber through the operation of its associated siphon.

3. An apparatus for the purpose set forth comprising a tank or receptacle, a plurality of siphons acting severally to empty said tank, a series of chambers which are severally associated with said siphons and filled from the source supplying liquid to the tank, means operated by the filling of each chamber for transmitting pressure to the siphon associated with another chamber of the series to start the same into action, and means for emptying each chamber through the operation of its associated siphon, the last chamber of the series being connected with the first siphon of the series whereby said siphons may be operated in a predetermined rotative order.

4. An apparatus for the purpose set forth comprising a tank or receptacle, a plurality of siphons acting severally to empty said tank, a series of chambers severally associated with said siphons and located in and filled from said tank, means operated by the filling of each chamber for transmitting pressure to the siphon associated with another chamber of the series and means for emptying each chamber through the operation of its associated siphon.

5. An apparatus for the purpose set forth comprising a tank or receptacle, a plurality of siphons in said tank acting severally to empty said tank, a series of chambers also in said tank which are severally associated with said siphons, means operated by the filling of each chamber for transferring pressure to the siphon associated with another chamber of the series to start the same into operation and means for emptying each chamber through the operation of its associated siphon.

6. An apparatus for the purpose set forth comprising a tank or receptacle, a plurality of siphons acting severally to empty said tank, and provided with trapped discharge ends, a series of chambers severally associated with said siphons, and filled from the source supplying liquid to the tank, a pipe communicating at one end with each siphon and sealed at its lowest part and having open communication at its other end with the chamber associated with one of the other siphons, and means for emptying each chamber through the operation of its associated siphon.

7. An apparatus for the purpose set forth comprising a tank or receptacle, a plurality of siphons acting severally to empty said tank and provided with trapped discharge ends, a series of chambers severally associated with said siphons and filled from the source supplying liquid to said tank, a downwardly-opening bell in each chamber, a pipe connected with each siphon and dipping into its associated chamber, and a pipe communicating at one end with each bell and at its other end with a siphon associated with another chamber of the series, said parts being constructed to empty the chambers below the sealing-levels of the bells.

8. An apparatus for the purpose set forth comprising a tank or receptacle, a plurality of siphons acting severally to empty said tank and provided with trapped discharge ends, a series of chambers severally associated with said siphons, and filled from the source supplying liquid to said tank, a downwardly-opening bell in each chamber, a pipe communicating at one end with each bell, and at its other end with a siphon associated with another chamber of the series, and means for emptying each chamber through the action of its associated siphon below the sealing-level of the bell therein.

9. An apparatus for the purpose set forth comprising a tank or receptacle, a plurality of siphons acting severally to empty said tank and provided with trapped discharge ends, a series of chambers severally associated with said siphons and filled from the source supplying liquid to said tank, a downwardly-opening bell in each chamber, a pipe connected with each siphon and dipping into its associated chamber, a pipe communicating at one end with each bell and at its other end with a siphon associated with another chamber of the series, and a vent-pipe communicating with each of the last-mentioned pipes above the bell thereof and extending downwardly with its lower open end above the lower end of said bell.

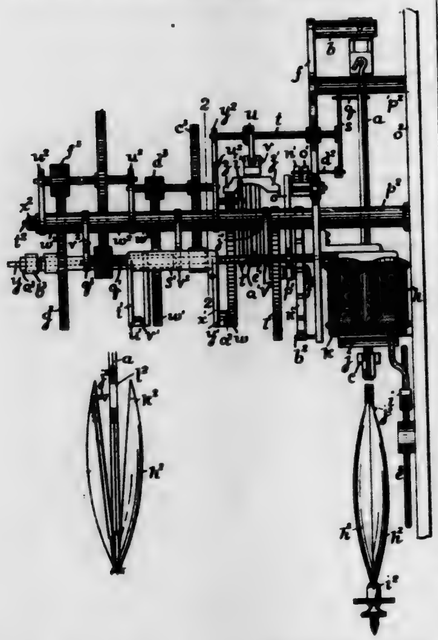
10. An apparatus for the purpose set forth comprising a tank or receptacle, a plurality of siphons acting severally to empty said tank and provided with trapped discharge ends, a series of chambers severally associated with said siphons and filled from the source supplying liquid to the tank, means operated by the filling of each chamber for transmitting pressure to the siphon associated with another chamber of the series, an emptying-pipe communicating at one end with each siphon and dipping into its associated chamber and means for maintaining said emptying-pipes constantly sealed.

11. An apparatus for the purpose set forth comprising a tank or receptacle, a plurality of siphons acting severally to empty said tank and provided with sealed discharge ends, a series of chambers which are severally associated with said siphons and filled from the source supplying liquid to said tank, a pipe communicating at one end with each siphon

and sealed at its lower part and communicating at its other end with the chamber associated with another one of the siphons, whereby the rise of liquid in said chamber communicates pressure through said pipe to said siphon, an emptying-pipe communicating with each of the siphons and dipping into its associated chamber for emptying the latter through said pipe and associated siphon, and means for maintaining constantly sealed the lower ends of said emptying-pipes.

12. An apparatus for the purpose set forth comprising a tank or receptacle, a plurality of siphons acting severally to empty said tank and provided with trapped discharge ends and also with blow-off traps communicating with said discharge ends, a series of chambers severally associated with said siphons and filled from the source supplying liquid to said tank, a downwardly-opening bell in each chamber, an emptying-pipe connected with each siphon and dipping into its associated chamber, and a pipe communicating at one end with each bell and at its other end with the blow-off pipe of a siphon associated with another chamber.

709,284. **ELECTRIC CLOCK.** CARL J. MOSSNER, Jersey City, N. J., assignor to Adam R. Schatz, Mount Vernon, N. Y. Filed May 26, 1897. Renewed Jan. 17, 1901. Serial No. 43,629. (No model.)



Claim.—1. The combination in a pendulum-actuating circuit of a circuit-closing lever, a pawl synchronously actuated by the pendulum for actuating said lever, and a pawl-carrying device whereon the pawl rests and reciprocates said device preventing engagement of said pawl with the lever while the impulses enable said pawl to reach said carrier, and permitting engagement when the pawl fails to reach thereto substantially as described.

2. The combination in a pendulum-actuating circuit, of a circuit-closing lever, a pawl synchronously actuated by the pendulum for actuating said lever, a pawl carrying device whereon the pawl rests and reciprocates said device preventing engagement of said pawl with said lever while the impulses enable said pawl to reach said carrier, and permitting engagement when the pawl fails to reach thereto, and a time-train-actuating pawl said pawl being an attachment of the pendulum-pawl carrier substantially as described.

3. The combination with the train-actuating mechanism, the pendulum and the pawl actuated by the pendulum, of a contact-lever adapted to be engaged by the pendulum-pawl when said pawl fails to catch the train-driving pawl, said contact-lever also adapted to actuate the train-pawl when not actuated by the pendulum-pawl substantially as described.

4. The combination in the pendulum-actuating circuit, of the hook-pawl actuated by the pendulum, time-train-actuating pawl-lever and pawl, actuated by said hook-pawl, the pawl-carrying device for releasing the train-actuating pawl, and means for periodically closing the circuit substantially as described.

5. The combination in the pendulum-actuating circuit, of the hook-pawl actuated by the pendulum, time-train-actuating pawl-lever and pawl actuated by said hook-pawl, pawl-carrying device for releasing the train-actuating pawl, the circuit-closing lever, and circuit-closing contact-springs substantially as described.

6. The combination in the pendulum-actuating circuit, of the hook-pawl actuated by the pendulum, contact-springs, pawl-lever having the pawl-engaging hook, the train-actuating pawl and the pawl-detaching rocker, contact-lever adapted to be engaged by the pawl when failing to reach the hook, and the circuit-closing pin of the contact-lever, substantially as described.

7. The combination in the pendulum-actuating circuit, of the hook-pawl actuated by the pendulum, contact-springs, pawl-lever having the engaging hook and the pawl-detaching rocker, contact-lever adapted to be engaged by the pawl when failing to reach the hook, circuit-closing pin of the contact-lever, said lever pivoted in the axis of the seconds-hand staff, and the pawl of the said pawl-lever engaging the seconds-hand wheel substantially as described.

8. The combination in the pendulum-actuating circuit, of the hook-pawl actuated by the pendulum, pawl-lever and pawl actuated by said hook-pawl for actuating the time-train and means actuated by said pendulum-actuated pawl for periodically closing the circuit, and means also actuated by said pawl to periodically actuate the striking-train substantially as described.

9. In an electric clock, the combination of the time-train, striking-train pawl adapted to actuate both trains in their due order of operation, and the hook-pawl actuated by the pendulum and actuating said train-actuating pawl substantially as described.

10. The combination in the pendulum-actuating circuit, of the hook-pawl actuated by the pendulum, means actuated by said pawl for periodically closing the circuit, and to actuate the time-train, and also to periodically actuate the striking-train said striking-train being periodically movable into and out of connection with the time-train-actuating device, and provided with means therefor substantially as described.

11. The combination in the hammer-actuating circuit, of the contact-springs, the lever actuated by the pendulum, circuit-closing piece in the extremity of said lever, the striking-wheel and its actuating-wheel on a movable support, means actuated by the seconds-hand wheel to close the circuit by movement of said striking-wheel support, and a pawl actuated by the pendulum adapted to actuate the striking-wheel periodically substantially as described.

12. The combination with the time-train in an electric clock, of the striking-train consisting of two wheels secured to the same axis and always moving together, and means to actuate said train periodically by the time-train-actuating pawl, said striking-train being periodically movable into and out of contact with the time-train actuating device substantially as described.

13. The combination with the time-train in an electric clock, of a striking-train that is movable out of its resting-place for striking, and means actuated by the time-train for so moving the striking-train, substantially as described.

14. In an electric clock the framework for supporting the trains consisting of two series of uniform arched pivot-supporting bridges placed in alternately upright and reversed relation and all mounted at their extremities on a supporting-pillar which serves alike for both series and is continuous through all the bridges with suitable spacing-collars, the time-indicating staffs being pivoted in one series of bridges, and back gear-pivots in the other series of bridges substantially as described.

15. The combination in the hammer-actuating circuit, of the contact-springs, stop-stud for the striking-wheel, said striking-wheel located on a movable support intermediately of the stud and contact-springs, means actuated by the seconds-hand wheel to close the circuit and release the striking-wheel from the stop-stud by movement of said striking-wheel support, and means actuated by the pendulum for periodically turning the striking-wheel substantially as described.

16. The combination in the hammer-actuating circuit, of the contact-springs, striking-wheel, and its actuating-wheel located on a movable support, and about in the axis of the seconds-hand staff, means actuated by the seconds-hand wheel to periodically close the circuit by movement of said striking-wheel support, and a pawl actuated by the pendulum, and adapted to operate the striking-wheel-actuating wheel when its support is moved for closing the circuit substantially as described.

17. The combination in the hammer-actuating circuit, of the contact-springs, striking-wheel and its actuating-wheel located on a movable support, and about in the axis of the seconds-hand staff, means actuated by the seconds-hand wheel to periodically close the circuit by movement of said striking-wheel support, and a pawl actuated by the pendulum and consisting of a branch of the seconds-hand-wheel-actuating pawl adapted to operate the striking-wheel-actuating wheel when its support is moved for closing the circuit substantially as described.

18. In an electric clock, the combination with independent electric actuating mechanisms for the time-train and the striking-train respectively, of independent impelling electric currents therefor, of equal electromotive force, and a resistance device in the circuit of the striking-train, whereby operation of the striking-train will cease through diminishing power of the battery prior to cessation of operation by the time-train substantially as described.

19. An electric clock-striking train provided with means adapted to terminate its action in advance of the termination of the action of the time-train said trains being actuated by independent circuits of equal tension, substantially as described.

20. In an electric clock having independent circuits and currents of equal tension for actuating the pendulum and striking mechanism respectively, the combination in the hammer-actuating circuit, of an electrical resistance adapted to terminate the action of the striking-train prior to the termination of the action of the time-train when the force of the currents diminishes substantially as described.

21. In a clock-pendulum the combination with the bar, and the bob-adjusting devices, of a bob that is detachable and attachable with the adjusting devices fixed to support the bob in its adjusted position, substantially as described.

22. In a clock-pendulum, the combination with the bar, and the bob-adjusting devices, of the bob constructed in two parts adapted to clamp on the bar attachably and detachably with the adjusting devices fixed to support the bob in its adjusted position and means to confine the clamped parts thereon substantially as described.

23. The combination in the striking apparatus, of the striking-wheel having the graduated notches in the periphery for controlling the number of strokes and being automatically movable periodically into and out of connection with its actuator, a support for maintaining it in connection with the actuating mechanism during the striking, contact devices of the hammer-actuating circuit, and means to close said contacts actuated by the means effecting connection of the striking-wheel with its actuating device substantially as described.

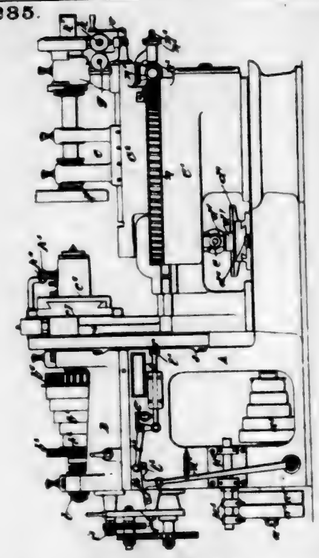
24. In a pendulum-actuating circuit, the combination with a going wheel; of a pendulum operatively connected with and normally imparting a step-by-step movement to said going wheel, the amplitude of range of movement of the pendulum gradually decreasing until the operative connection is broken; and means for automatically reviving the amplitude of range of movement of the pendulum, said means comprising an electric circuit; a circuit-closing mechanism normally inactive with the circuit broken and an actuating device for said mechanism normally forming a portion of the operative connection between the pendulum and going wheel, said device actuating said mechanism when the movement of the pendulum is insufficient to impart the step-by-step movement to the going wheel.

25. In a pendulum-actuating circuit, a pendulum; a going wheel operatively connected thereto; a circuit-closing mechanism; an actuating device for said mechanism forming a portion of the operative connection between the pendulum and going wheel; and a support for said device, said support forming a portion of said operative connection and normally preventing engagement between said device and mechanism while the amplitude of range of movement of the pendulum is sufficient to impart a step-by-step movement to the going wheel, and permitting such engagement when such range of movement is insufficient to actuate said going wheel, whereby the extreme amplitude of range of movement of the pendulum will be automatically revived.

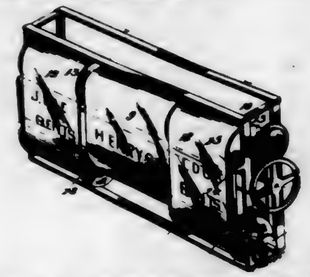
709,285. **MACHINE FOR CUTTING HELICOIDAL GEAR-TEETH.** LÉON F. A. MOUSSETTE, Paris, France. Filed Dec. 14, 1896. Serial No. 740,266. (No model.)

Claim.—In a machine for generating gear-teeth, the combination of a pivotally-mounted guide, a tool-slide reciprocable thereon carrying a cutting-tool, and means to reciprocate said slide on said guide, of an angularly-adjustable work-table, carrying a rotatable work-support, means to rotate said support including a worm-wheel mounted thereon, a train of gearing connecting said worm-wheel with the means for reciprocating the tool-slide, said train of gearing passing through the pivot of the angularly-adjustable work-table, so that its operation is not affected by any adjustment of the work-table, means operated by the aforesaid worm-wheel once in each revolution thereof to turn the guide of the tool-slide about its axis and to give an additional rotation to the blank-support, so that the tool will be fed into the blank in such a way as to generate the proper tooth-curve.

709,285.



709,286. **STREET-INDICATOR FOR RAILWAY-CARS.** CHARLES R. MORGAN, Portland, Oreg., assignor, by direct and mesne assignments, to Automatic Street Indicator Company, a Corporation. Filed Jan. 14, 1902. Serial No. 89,654. (No model.)



Claim.—1. In an indicator for street-cars and other public conveyances, a frame provided with the indicating mechanism and mounted to receive a limited sliding movement, actuating mechanism for imparting movement to the indicating mechanism, and means for sliding the said frame to disengage the actuating mechanism from the indicating mechanism for a proper setting or adjusting of the latter, substantially as set forth.

2. In an indicator for street-cars and other public conveyances, an indicating mechanism mounted to receive a limited sliding movement, means for exerting a spring-pressure upon the indicating mechanism to hold it in a predetermined position, actuating mechanism normally in mesh with the indicating mechanism, and a button or like contrivance to be operated by hand for sliding the indicating mechanism to throw it out of gear with the actuating mechanism and serving as a means for adjusting or setting the said indicating mechanism, substantially as set forth.

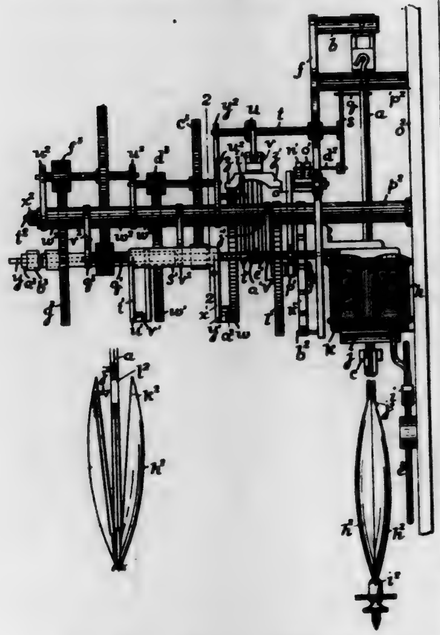
3. In an indicator for street-cars and other public conveyances, indicating mechanism, a rewinding-spring in coöperative relation therewith, a detent mechanism for preventing recoil of the said spring, a trip normally holding the detent mechanism out of action, an actuating mechanism, and means operated by hand for shifting the indicating mechanism and admitting of proper adjustment thereof, the shifting of the indicating mechanism throwing it out of meshing relation with the actuating mechanism without permitting disengagement of the aforementioned detent mechanism from the trip coöperating therewith, substantially as set forth.

4. In a street-indicator for the purposes specified, a case, a frame removably fitted within the case and provided with the indicating mech-

and sealed at its lower part and communicating at its other end with the chamber associated with another one of the siphons, whereby the rise of liquid in said chamber communicates pressure through said pipe to said siphon, an emptying-pipe communicating with each of the siphons and dipping into its associated chamber for emptying the latter through said pipe and associated siphon, and means for maintaining constantly sealed the lower ends of said emptying-pipes.

12. An apparatus for the purpose set forth comprising a tank or receptacle, a plurality of siphons acting severally to empty said tank and provided with trapped discharge ends and also with blow-off traps communicating with said discharge ends, a series of chambers severally associated with said siphons and filled from the source supplying liquid to said tank, a downwardly-opening bell in each chamber, an emptying-pipe connected with each siphon and dipping into its associated chamber, and a pipe communicating at one end with each bell and at its other end with the blow-off pipe of a siphon associated with another chamber.

709,284. **ELECTRIC CLOCK.** CARL J. MOSSNER, Jersey City, N. J., assignor to Adam E. Schatz, Mount Vernon, N. Y. Filed May 26, 1897. Renewed Jan. 17, 1901. Serial No. 43,689. (No model.)



Claim.—1. The combination in a pendulum-actuating circuit of a circuit-closing lever, a pawl synchronously actuated by the pendulum for actuating said lever, and a pawl-carrying device whereon the pawl rests and reciprocates said device preventing engagement of said pawl with the lever while the impulses enable said pawl to reach said carrier, and permitting engagement when the pawl fails to reach thereto substantially as described.

2. The combination in a pendulum-actuating circuit, of a circuit-closing lever, a pawl synchronously actuated by the pendulum for actuating said lever, a pawl carrying device whereon the pawl rests and reciprocates said device preventing engagement of said pawl with said lever while the impulses enable said pawl to reach said carrier, and permitting engagement when the pawl fails to reach thereto, and a time-train-actuating pawl said pawl being an attachment of the pendulum-pawl carrier substantially as described.

3. The combination with the train-actuating mechanism, the pendulum and the pawl actuated by the pendulum, of a contact-lever adapted to be engaged by the pendulum-pawl when said pawl fails to catch the train-driving pawl, said contact-lever also adapted to actuate the train-pawl when not actuated by the pendulum-pawl substantially as described.

4. The combination in the pendulum-actuating circuit, of the hook-pawl actuated by the pendulum, time-train-actuating pawl-lever and pawl, actuated by said hook-pawl, the pawl-carrying device for releasing the train-actuating pawl, and means for periodically closing the circuit substantially as described.

5. The combination in the pendulum-actuating circuit, of the hook-pawl actuated by the pendulum, time-train-actuating pawl-lever and pawl actuated by said hook-pawl, pawl-carrying device for releasing the train-actuating pawl, the circuit-closing lever, and circuit-closing contact-springs substantially as described.

6. The combination in the pendulum-actuating circuit, of the hook-pawl actuated by the pendulum, contact-springs, pawl-lever having the pawl-engaging hook, the train-actuating pawl and the pawl-detaching rocker, contact-lever adapted to be engaged by the pawl when failing to reach the hook, and the circuit-closing pin of the contact-lever, substantially as described.

7. The combination in the pendulum-actuating circuit, of the hook-pawl actuated by the pendulum, contact-springs, pawl-lever having the engaging hook and the pawl-detaching rocker, contact-lever adapted to be engaged by the pawl when failing to reach the hook, circuit-closing pin of the contact-lever, said lever pivoted in the axis of the seconds-hand staff, and the pawl of the said pawl-lever engaging the seconds-hand wheel substantially as described.

8. The combination in the pendulum-actuating circuit, of the hook-pawl actuated by the pendulum, pawl-lever and pawl actuated by said hook-pawl for actuating the time-train and means actuated by said pendulum-actuated pawl for periodically closing the circuit, and means also actuated by said pawl to periodically actuate the striking-train substantially as described.

9. In an electric clock, the combination of the time-train, striking-train pawl adapted to actuate both trains in their due order of operation, and the hook-pawl actuated by the pendulum and actuating said train-actuating pawl substantially as described.

10. The combination in the pendulum-actuating circuit, of the hook-pawl actuated by the pendulum, means actuated by said pawl for periodically closing the circuit, and to actuate the time-train, and also to periodically actuate the striking-train said striking-train being periodically movable into and out of connection with the time-train-actuating device, and provided with means therefor substantially as described.

11. The combination in the hammer-actuating circuit, of the contact-springs, the lever actuated by the pendulum, circuit-closing piece in the extremity of said lever, the striking-wheel and its actuating-wheel on a movable support, means actuated by the seconds-hand wheel to close the circuit by movement of said striking-wheel support, and a pawl actuated by the pendulum adapted to actuate the striking-wheel periodically substantially as described.

12. The combination with the time-train in an electric clock, of the striking-train consisting of two wheels secured to the same axis and always moving together, and means to actuate said train periodically by the time-train-actuating pawl, said striking-train being periodically movable into and out of contact with the time-train actuating device substantially as described.

13. The combination with the time-train in an electric clock, of a striking-train that is movable out of its resting-place for striking, and means actuated by the time-train for so moving the striking-train, substantially as described.

14. In an electric clock the framework for supporting the trains consisting of two series of uniform arched pivot-supporting bridges placed in alternately upright and reversed relation and all mounted at their extremities on a supporting-pillar which serves alike for both series and is continuous through all the bridges with suitable spacing-collars, the time-indicating staffs being pivoted in one series of bridges, and back gear-pivots in the other series of bridges substantially as described.

15. The combination in the hammer-actuating circuit, of the contact-springs, stop-stud for the striking-wheel, said striking-wheel located on a movable support intermediately of the stud and contact-springs, means actuated by the seconds-hand wheel to close the circuit and release the striking-wheel from the stop-stud by movement of said striking-wheel support, and means actuated by the pendulum for periodically turning the striking-wheel substantially as described.

16. The combination in the hammer-actuating circuit, of the contact-springs, striking-wheel, and its actuating-wheel located on a movable support, and about in the axis of the seconds-hand staff, means actuated by the seconds-hand wheel to periodically close the circuit by movement of said striking-wheel support, and a pawl actuated by the pendulum, and adapted to operate the striking-wheel-actuating wheel when its support is moved for closing the circuit substantially as described.

17. The combination in the hammer-actuating circuit, of the contact-springs, striking-wheel and its actuating-wheel located on a movable support, and about in the axis of the seconds-hand staff, means actuated by the seconds-hand wheel to periodically close the circuit by movement of said striking-wheel support, and a pawl actuated by the pendulum and consisting of a branch of the seconds-hand-wheel-actuating pawl adapted to operate the striking-wheel-actuating wheel when its support is moved for closing the circuit substantially as described.

18. In an electric clock, the combination with independent electric actuating mechanisms for the time-train and the striking-train respectively, of independent impelling electric currents therefor, of equal electromotive force, and a resistance device in the circuit of the striking-train, whereby operation of the striking-train will cease through diminishing power of the battery prior to cessation of operation by the time-train substantially as described.

19. An electric clock-striking train provided with means adapted to terminate its action in advance of the termination of the action of the time-train said trains being actuated by independent circuits of equal tension, substantially as described.

20. In an electric clock having independent circuits and currents of equal tension for actuating the pendulum and striking mechanism respectively, the combination in the hammer-actuating circuit, of an electrical resistance adapted to terminate the action of the striking-train prior to the termination of the action of the time-train when the force of the currents diminishes substantially as described.

21. In a clock-pendulum the combination with the bar, and the bob-adjusting devices, of a bob that is detachable and attachable with the adjusting devices fixed to support the bob in its adjusted position, substantially as described.

22. In a clock-pendulum, the combination with the bar, and the bob-adjusting devices, of the bob constructed in two parts adapted to clamp on the bar attachably and detachably with the adjusting devices fixed to support the bob in its adjusted position and means to confine the clamped parts thereon substantially as described.

23. The combination in the striking apparatus, of the striking-wheel having the graduated notches in the periphery for controlling the number of strokes and being automatically movable periodically into and out of connection with its actuator, a support for maintaining it in connection with the actuating mechanism during the striking, contact devices of the hammer-actuating circuit, and means to close said contacts actuated by the means effecting connection of the striking-wheel with its actuating device substantially as described.

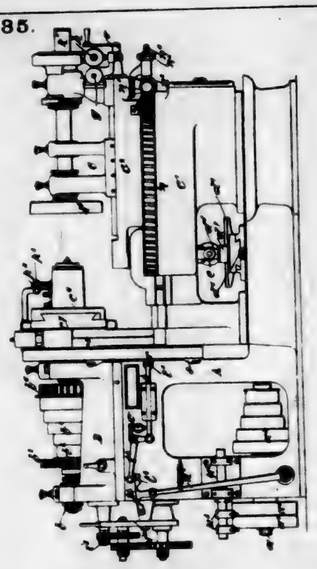
24. In a pendulum-actuating circuit, the combination with a going wheel; of a pendulum operatively connected with and normally imparting a step-by-step movement to said going wheel, the amplitude of range of movement of the pendulum gradually decreasing until the operative connection is broken; and means for automatically reviving the amplitude of range of movement of the pendulum, said means comprising an electric circuit; a circuit-closing mechanism normally inactive with the circuit broken and an actuating device for said mechanism normally forming a portion of the operative connection between the pendulum and going wheel, said device actuating said mechanism when the movement of the pendulum is insufficient to impart the step-by-step movement to the going wheel.

25. In a pendulum-actuating circuit, a pendulum; a going wheel operatively connected thereto; a circuit-closing mechanism; an actuating device for said mechanism forming a portion of the operative connection between the pendulum and going wheel; and a support for said device, said support forming a portion of said operative connection and normally preventing engagement between said device and mechanism while the amplitude of range of movement of the pendulum is sufficient to impart a step-by-step movement to the going wheel, and permitting such engagement when such range of movement is insufficient to actuate said going wheel, whereby the extreme amplitude of range of movement of the pendulum will be automatically revived.

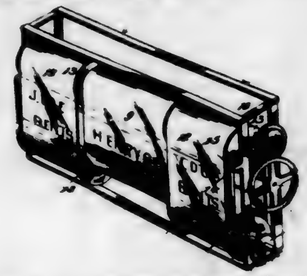
709,285. **MACHINE FOR CUTTING HELICOIDAL GEAR-TEETH.** LÉON F. A. MOSSERAY, Paris, France. Filed Dec. 14, 1899. Serial No. 740,256. (No model.)

Claim.—In a machine for generating gear-teeth, the combination of a pivotally-mounted guide, a tool-slide reciprocable thereon carrying a cutting-tool, and means to reciprocate said slide on said guide, of an angularly-adjustable work-table, carrying a rotatable work-support, means to rotate said support including a worm wheel mounted thereon, a train of gearing connecting said worm-wheel with the means for reciprocating the tool-slide, said train of gearing passing through the pivot of the angularly-adjustable work-table, so that its operation is not affected by any adjustment of the work-table, means operated by the aforesaid worm-wheel once in each revolution thereof to turn the guide of the tool-slide about its axis and to give an additional rotation to the blank-support, so that the tool will be fed into the blank in such a way as to generate the proper tooth-curve.

709,285.



709,286. **STREET-INDICATOR FOR RAILWAY-CARS.** CHARLES E. MORGAN, Portland, Oreg., assignor, by direct and mesne assignments, to Automatic Street Indicator Company, a Corporation. Filed Jan. 14, 1902. Serial No. 89,694. (No model.)



Claim.—1. In an indicator for street-cars and other public conveyances, a frame provided with the indicating mechanism and mounted to receive a limited sliding movement, actuating mechanism for imparting movement to the indicating mechanism, and means for sliding the said frame to disengage the actuating mechanism from the indicating mechanism for a proper setting or adjusting of the latter, substantially as set forth.

2. In an indicator for street-cars and other public conveyances, an indicating mechanism mounted to receive a limited sliding movement, means for exerting a spring-pressure upon the indicating mechanism to hold it in a predetermined position, actuating mechanism normally in mesh with the indicating mechanism, and a button or like contrivance to be operated by hand for sliding the indicating mechanism to throw it out of gear with the actuating mechanism and serving as a means for adjusting or setting the said indicating mechanism, substantially as set forth.

3. In an indicator for street-cars and other public conveyances, indicating mechanism, a rewinding-spring in coöperative relation therewith, a detent mechanism for preventing recoil of the said spring, a trip normally holding the detent mechanism out of action, an actuating mechanism, and means operated by hand for shifting the indicating mechanism and admitting of proper adjustment thereof, the shifting of the indicating mechanism throwing it out of meshing relation with the actuating mechanism without permitting disengagement of the aforementioned detent mechanism from the trip coöperating therewith, substantially as set forth.

4. In a street-indicator for the purposes specified, a case, a frame removably fitted within the case and provided with the indicating mech-

anism, a spring applied to said frame for actuating the indicating mechanism, a ratchet and pawl for preventing recoil of said spring when the frame is removed from the case, and a trip fixed within the case and adapted to disconnect the pawl from the ratchet and admit of free operation of the aforementioned spring when the frame is properly positioned within the case, substantially as set forth.

5. In an indicator for street-railway cars and public conveyances, the combination of indicating mechanism, a spring in coöperative relation thereto to be wound upon travel of the car in one direction, and actuating mechanism for effecting movement of the indicating mechanism and a winding up of the said spring and including a ratchet-and-pawl and trip devices, said pawl and trip embodying movable parts for alternate coöperation with the ratchet-wheel to admit of a backward movement of the ratchet-wheel when the car is making a return trip, substantially as set forth.

6. In an indicator of the character described, and in combination with the indicating mechanism, and a coil-spring in coöperative relation therewith for returning the parts to an initial position, actuating mechanism including a ratchet-wheel, pawl and trip, whereby the indicating mechanism is intermittently operated, the pawl and trip having yieldable parts for alternate coöperation with the teeth of the ratchet-wheel to permit of its backward movement one tooth at a time, substantially as and for the purpose set forth.

7. In an indicator for street-cars, public conveyances and in combination with the indicating mechanism, a spring in coöperative relation therewith to be wound when the car is traveling in one direction and adapted to unwind and to operate the indicating mechanism when the car is on the return trip, actuating mechanism for positively operating the indicating mechanism and adapted to control the unwinding of the aforementioned spring, said actuating mechanism including a ratchet-wheel, a pawl having a yieldable part, and a trip having a yieldable part for coöperation with the teeth of the ratchet-wheel and provided with an extension for engagement with the yieldable part of the pawl, substantially as set forth.

8. In combination with indicating mechanism and a spring in coöperative relation therewith, actuating mechanism comprising a ratchet-wheel, a pawl having a spring-actuated pivoted tailpiece, a trip having a spring-actuated pivoted end piece for coöperation with the teeth of the ratchet-wheel, and a projection extended from the said trip into the path of the pivoted tailpiece of the aforementioned pawl, the parts being combined to effect positive actuation of the indicating mechanism and a winding of the spring upon the out trip of the car and adapted to control the unwinding of the spring for intermittent operation of the indicating mechanism when the car is making a return trip, substantially as specified.

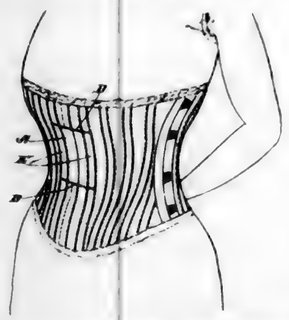
709,287. METAL WINDOW AND WINDOW-FRAME. William E. Muse, Cincinnati, Ohio. Filed Apr. 5, 1901. Serial No. 54,534. (No model.)

Claim.—1. A window made of hollow metal, having sashes provided with flanges, and a frame provided with grooves in which said flanges fit, the sashes having offsets adapted to engage each other when closed, said grooves, flanges and offsets being so arranged relatively to each other, that when closed the window is impervious to dust, rain or fire, said frame being provided with sections having flanges, said sections adapted to be removably fitted in the frame and hold or suspended therein by means of a hooked or turned-over portion engaging a flanged portion of the lintel, substantially as described.

2. A window made of hollow metal, having frame and sashes, the sashes having flanges and the frame having grooves in which said flanges fit, offsets on the sashes adapted to engage each other when the sashes are closed, a chain connecting the sashes and supported on a pulley mounted in the lintel, an overweight in the lower sash, a catch adapted to support the lower sash, said catch having flexible connection with the jamb, all substantially as and for the purpose described.

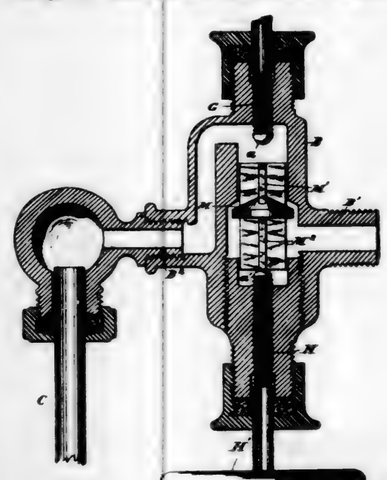
3. A window made of hollow metal, having a frame and sashes, the sashes having flanges and the frame having grooves in which said flanges fit, offsets on the sashes adapted to engage each other when the sashes are closed, chains mounted on pulleys on the lintel suitably arranged so as to support said sashes, catches adapted to support said sashes, the catches having flexible connection with the jamb and the sashes being suitably weighted, so that upon the fusion of the connections to the jamb, the sashes will close automatically, substantially as described.

709,288. CORSET. Sallie G. McClain, Philadelphia, Pa. Filed Aug. 17, 1901. Serial No. 73,456. (No model.)



Claim.—In a corset a body having a double thickness of folded material at the front, parallel rows of stitching part way around the corset and vertical stitching through the folds from the upper and lower edges of the corset extending to the first-named stitching, the folds between the first-named stitching being free to expand substantially as described.

709,289. WATER-GAGE CONNECTION. Joel B. L. McKenzie, Rahway, N. J. Filed Feb. 6, 1902. Serial No. 92,796. (No model.)



Claim.—In a safety connection for water-gage the closing-screw H and opening-screw G, arranged in a vertical line, and the vertically-moving valve M with its upper wings M' and lower wings M² loosely guided in the chambers *a* and *a'*, arranged to be acted on by the contracted ends of such screws, all adapted to serve substantially as herein specified.

709,240. GAGE FOR MEASURING KEYS FOR PIN-TUMBLER LOCKS. Edwin B. Phelps, New York, N. Y. Filed June 10, 1901. Serial No. 63,943. (No model.)

Claim.—1. A key-gage comprising a number of index-fingers, means for supporting a key, having depressions, in such relation to said fingers as to impart adjustment to said fingers to an extent governed by the depressions in the key, and a scale for indicating the extent of movement of the fingers, the scale being adapted in conjunction with the fingers to indicate in a multiplied ratio differences between the depressions of one key and corresponding depressions of another key, substantially as described.

2. A key-gage comprising a number of index-fingers and parts coöperating therewith to adjust the fingers to an extent determined by depressions in a key, means for supporting a key, having depressions, in such relation to said coöperating parts that said parts will enter the depressions in the key and determine the extent of movement of the index-fingers, and a scale adapted to indicate the extent of movement of the index-fingers, said fingers indicating upon the scale in a multiplied ratio differences that may exist between the depressions of one key and corresponding depressions of another key, substantially as described.

3. A key-gage comprising a number of index-fingers, means for supporting a key, having depressions, in such relation to said fingers as to impart adjustment to the fingers to an extent governed by the depressions in the key, and a scale for indicating the extent of movement of the fingers, said scale having parts adjustable to a predetermined normal movement of the index-fingers and in conjunction with the fingers adapted to indicate in a multiplied ratio differences that may exist between the depressions in a key which conform to the normal movement of the fingers and corresponding depressions in a duplicate key that cause an abnormal movement of the fingers, substantially as described.

4. A gage for measuring keys for tumbler-locks, comprising tumblers, movable index-fingers resting upon the tumblers, and a rack provided with pointers adjustable in relation to the index-fingers, substantially as described.

5. A gage for measuring keys for tumbler-locks, comprising a replaceable key-slotted lock-barrel, tumblers adapted to be operated by a key inserted in the slot of the barrel, pivoted index-fingers resting upon the tumblers, and a rack provided with pointers adjustable in relation to the index-fingers, substantially as described.

6. A gage for measuring keys for tumbler-locks, comprising tumblers, movable index-fingers resting upon the tumblers, and a folding rack provided with pointers adjustable in relation to the index-fingers, substantially as described.

7. A gage for measuring keys for tumbler-locks, comprising tumblers, movable index-fingers resting upon the tumblers, and a curved rack provided with pointers adjustable in relation to the index-fingers, substantially as described.

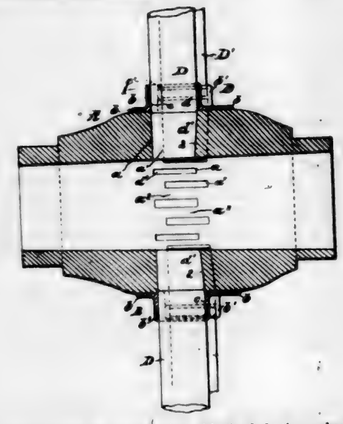
8. A gage for measuring keys for tumbler-locks, comprising tumblers, movable index-fingers resting upon the tumblers, a hinged rack provided with pointers adjustable in relation to the index-fingers, and means for locking the rack in an upright position, substantially as described.

9. A gage for measuring keys for tumbler-locks, comprising tumblers, movable index-fingers resting upon the tumblers, a hinged rack provided with pointers adjustable in relation to the index-fingers, stop-pins for checking the movement of the rack in one direction, and an eccentric lever for locking the rack against movement in the opposite direction, substantially as described.

709,241. VEHICLE-HUB. Emmett B. Phillips, Richmond, Va. Filed Oct. 1, 1901. Serial No. 77,349. (No model.)

Claim.—1. A vehicle-hub composed of the central wooden-block A formed with the central spindle-aperture and with the alternating mortises *a*, *a'*, those at *a* being arranged with their radial axes substantially at right angles to the axis of the hub and those at *a'* having their corresponding axes inclined to the axis of the hub, each of said mortises *a*, *a'*, having at its end a wall 2 inclined to the opposite wall, the spokes having relatively thin tenons *d* fitted in the said mortises and having one edge tapered or inclined and the clamping-ring B formed with the sockets *c*, *c'*, said sockets being each substantially uniform in cross-section.

2. The hub composed of the central wooden block A made in one piece and formed with the central spindle-aperture and the mortises *a*, *a'* separated each at its inner end from the next by a relatively wide mass of wood, as at a^3, in combination with the continuous metallic band B having the wide relatively thin base *b*, with the two rows of spoke-sockets *c*, *c'*, those of one row staggered as to those of the other, and surrounded by the upwardly-elongated flanges *b'*, the interior walls of each of the said flanges being parallel to each other from the outer surface of the metal to the surface of the wooden block front and rear, and the walls of the sockets *c'* being inclined relatively to the walls of the sockets *c*, and the spokes D having the tenons *d'* with their inner ends relatively remote from each other, and having the shouldered parts *d* uniform throughout in cross-section, as described.

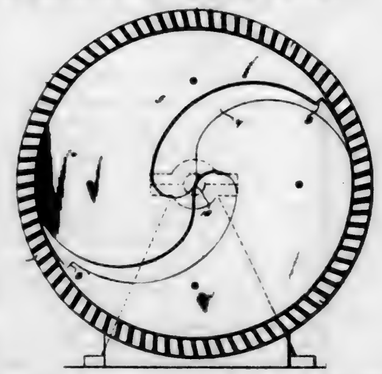


3. In a wheel, the combination with the hub, the spokes and the felly, of a spoke-supporting metallic band surrounding the hub and having outwardly-projecting rectangular sockets for the spokes, said sockets having opposing walls for the four sides of the spoke, the opposing walls being parallel with each other between the outer and inner peripheries of the said band.

4. In a wheel the combination with the hub, the spokes and the felly, of a spoke-supporting metallic band surrounding the hub and having sockets for the spokes, said sockets having opposing parallel inwardly and outwardly extending walls for the four sides of the spoke and said hub having mortises for the spoke-tenons, the mortises being formed with opposing parallel side walls and with end walls, one of which walls 2 is inclined relative to the other.

5. In a wheel, the combination with the mortised hub, the spokes provided with tenons, and the felly, of a metallic band having radial apertures for the spokes, the apertures of said band and those parts of the spokes engaged thereby being of uniform cross-section without taper, the spoke-tenons being tapered on one edge, and the mortises being shaped to correspond with said tenons, substantially as set forth.

709,242. ROTARY ENGINE. Thomas D. Prescott, Philadelphia, and James C. Prescott and Henry A. Prescott, Minersville, Pa., assignors of two-fifths to James H. Closson and Henry Bell, Philadelphia, Pa. Filed Sept. 20, 1901. Serial No. 75,864. (No model.)



Claim.—1. In a rotary engine, the combination with a stationary cylinder, of a piston formed of two disks, each having recesses extending from the center to the periphery and adapted to form steam-passages, one

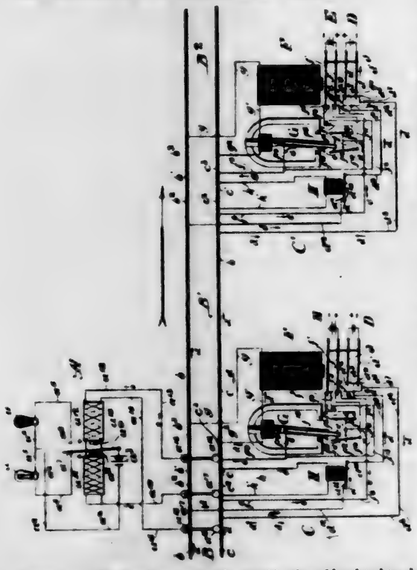
of said disks being provided with a division-wall to separate said recesses, and the opposite disk being provided with a steam-inlet pipe at a point directly in alinement with said division-wall.

2. In a rotary engine, the combination with a stationary cylinder, of two mating disks forming a piston, one of said disks having an enlarged hollow hub, an inlet pipe or nozzle extending through said hub, said hub and nozzle having interfitting flanges or shoulders, substantially as specified.

3. In a rotary engine, the combination with a stationary cylinder, of two mating disks forming a piston, one of said disks having an enlarged hollow hub forming an oil-receptacle, an inlet pipe or nozzle extending through said hub, there being at the opposite ends of the hub inwardly-projecting annular flanges adapted to form steam-tight joints between the hub and nozzle, substantially as specified.

4. A rotary steam-engine comprising in combination, a stationary cylinder having a series of steam-passages separated by inclined partitions forming abutments, a piston mounted for rotation within the cylinder, said piston comprising two mating disks having recesses forming steam-passages leading from the center to the periphery of the piston, said passages extending on curved lines and being of gradually-contracting area from the inlet to the outlet end and being provided near their outer ends with expansion-chambers, substantially as specified.

709,243. **RAILWAY-SIGNAL.** JONATHAN D. PRICE, Aurora, Ill., assignor to Miller Signal Company, Chicago, Ill., a Corporation of Illinois. Filed Sept. 21, 1900. Serial No. 30,674. (No model.)



Claim.—1. In signal apparatus, the combination of insulated track-rail sections, a signal-controlling electric source connected with two sections located one in advance of the other, an electric source connected with the advance ends of two sections belonging to different track-rails, a transient signal with conductors engaging the track, one in advance of the other, and means for changing the pole connections of said first-named electric source, substantially as described.

2. In signal apparatus, the combination of insulated track-rail sections, a signal-controlling electric source connected with two sections located one in advance of the other, a transient signal with conductors engaging the track, one in advance of the other, an electric source connected with a rail-section of each track-rail near the advance end thereof, and means for changing the pole connections of said second-named electric source, substantially as described.

3. In signal apparatus, the combination of insulated track-rail sections, a signal-controlling electric source connected with two sections located one in advance of the other, a transient signal with conductors engaging the track, one in advance of the other, a second electric source connected with a rail-section of each track-rail near the advance end thereof, means for changing the pole connections of the first-named electric source with its rail-sections, and means for changing the pole connections of said second-named electric source with its rail-sections, substantially as described.

4. In signal apparatus, the combination of a track divided into blocks, each track-rail having insulated rail-sections, signal-controlling electric sources connected at the block-junctions with two rail-sections located one in advance of the other, pole-changers in the local partial circuits of said sources of energy, sources of electric energy, a transient signal with conductors engaging the track, one in advance of the other, connected with both track-rails near the advance ends of the blocks, and electromagnetic instruments controlling said pole-changers and connected with both track-rails near the rear ends of the blocks, substantially as described.

5. In signal apparatus, the combination of a track divided into blocks, each track-rail having insulated sections, including a relatively short section at each block-junction, sources of electric energy connected with both track-rails near the advance ends of the blocks, pole-changers for the partial circuits thus formed, and electromagnetic instruments controlling said pole-changers and connected with both track-rails near the rear ends of the blocks, a transient signal with conductors engaging the track, one in advance of the other, and signal-controlling electric sources at the block-junctions and each having a connection with its adjacent relatively short rail-section, substantially as described.

6. In signal apparatus, the combination of a track divided into blocks, each track-rail having insulated rail-sections, a signal-controlling source of electric energy connected with two rail-sections at a given block-junction, a pole-changer for the local partial circuit thus formed, an electromagnetic instrument controlling said pole changer and connected with both track-rails near the rear end of the block on the advance side of said junction, a transient signal with conductors engaging the track, a source of electric energy at the advance block-junction connected with both track-rails near the advance end of said block, a pole-changer for the circuit of said last-named electric source, and an electromagnetic instrument controlling said last-named pole-changer and connected with both track-rails near the rear end of the second advance block, the track-rails being maintained electrically continuous intermediate their points of connection with said first-named electromagnetic instrument and said second-named electric source, substantially as described.

7. In signal apparatus, the combination of a track divided into blocks, each track-rail having insulated sections, a transient signal with conductors engaging the track, one in advance of the other, signal-controlling sources of electric energy each connected with two rail-sections located one in advance of the other, switches in the local partial circuits of said sources of energy, electromagnetic controlling instruments for said switches connected with both track-rails near the rear ends of the blocks, switch-controlling sources of electric energy connected with both track-rails near the advance ends of the blocks, each controlling a switch for the local partial circuit of the signal-controlling electric source located at the block-junction in its rear, and means for changing the pole connections of said switch-controlling sources of energy, substantially as described.

8. In signal apparatus, the combination of a track divided into blocks, each track-rail having insulated rail-sections, a transient signal with conductors engaging the track, one in advance of the other, signal-controlling electric sources, each connected with two rail-sections located one in advance of the other, switches for the local partial circuits thus formed, electromagnetic instruments controlling said switches connected with both track-rails near the rear ends of the blocks, switch-controlling sources of electric energy connected with both track-rails near the advance ends of the blocks, pole-changers in the circuits of said last-named electric sources, electromagnetic instruments controlling said pole-changers and connected with both track-rails near the rear ends of the blocks, additional switches for the local partial circuits of said signal-controlling sources, and electromagnetic instruments connected with both track-rails near the rear ends of the blocks and serving to control the movements of said last-named switches through reversals in the direction of current from said switch-controlling electric sources, whereby the condition of a second advance block may be indicated at a given block-junction, substantially as described.

9. In signal apparatus, the combination of a track divided into blocks, each track-rail having insulated rail-sections, a transient signal with conductors engaging the track, one in advance of the other, signal-controlling electric sources each connected with two rail-sections located one in advance of the other and forming therewith a local partial circuit, switches for the local partial circuits thus formed, controlling instruments for said switches connected with both track-rails near the rear ends of the blocks, additional switches for the local partial circuits mentioned, controlling instruments for said additional switches connected with both track-rails near the rear ends of the blocks, sources of electric energy connected with both track-rails near the advance ends of the blocks, each serving to operate the instruments controlling the switches of the local partial circuits located at the block-junction in its rear, pole-changers in the circuits of the electric sources connected with the advance ends of the blocks, and instruments controlling said last-named pole-changers and connected with both track-rails near the rear ends of the blocks, substantially as described.

10. In signal apparatus, the combination of a track divided into blocks, each track-rail having insulated rail-sections, a transient signal with conductors engaging the track, one in advance of the other, signal-controlling electric sources each connected with two rail-sections located one in advance of the other and forming therewith a local partial circuit, pole-changers for the local partial circuits thus formed, controlling instruments for said pole-changers connected with both track-rails near the rear ends of the blocks, additional pole-changers for the local partial circuits mentioned, controlling instruments for said additional pole-changers connected with both track-rails near the rear ends of the blocks, sources of electric energy connected with both track-rails near the advance ends of the blocks, each serving to operate the instruments controlling the pole-changers of the local partial circuit located at the block-junction in its rear, pole-changers in the circuits of the electric sources connected with the advance ends of the blocks, and instruments controlling said last-named pole-changers and connected with both track-rails near the rear ends of the blocks, substantially as described.

11. In signal apparatus, the combination of a track divided into blocks, each track-rail having insulated rail-sections, a transient signal with conductors engaging the track, one in advance of the other, signal-controlling electric sources, each connected with two rail-sections located one in advance of the other and forming therewith a local partial circuit, switches in said local partial circuits, instruments controlling said switches and connected with both track-rails near the rear ends of the blocks, additional switches in said local partial circuits, instruments controlling said additional switches and connected with both track-rails near the rear ends of the blocks, sources of electric energy connected with both track-rails near the advance ends of the blocks, switches in the circuits of said last-named sources, instruments controlling said last-named switches, each of said instruments being connected with the same rail-sections as is the signal-controlling electric source of the same block-junction, whereby a circuit for the controlling source is completed through the instrument, and pole-changers for the sources of energy connected with the advance ends of the blocks, substantially as described.

12. In signal apparatus, the combination of a track divided into blocks, each track-rail having insulated rail-sections, a transient signal with conductors engaging the track, one in advance of the other, signal-controlling batteries E connected with rail-sections c c', batteries D connected with the advance ends of rail-sections b c, pole-changing armatures f f and d d' vibrating between suitable contact-points in the circuits of the batteries E and D, respectively, electromagnetic instruments controlling said armatures and connected with both track-rails near the rear ends of the blocks, instruments G connected with both track-rails near the rear ends of the blocks, armatures f^{12} controlled by the instruments G, contact-points in the circuits of the batteries E between which the armatures f^{12} vibrate, and suitable connections whereby a reversal in the direction of current is effected when the armature f^{12} shifts, substantially as described.

13. In signaling apparatus, the combination of transient clear and danger signals, electrically-controlled mechanism for changing the signals, conductors leading therefrom to the track, a track having two insulated rail-sections simultaneously engaged by said conductors, a signal-controlling generator connected with said two insulated rail-sections and forming therewith a local partial circuit, and means for disconnecting each pole of said local generator from its rail-section and connecting the same with the rail-section of the other pole, whereby the direction of current through said train-carried conductors may be changed, substantially as described.

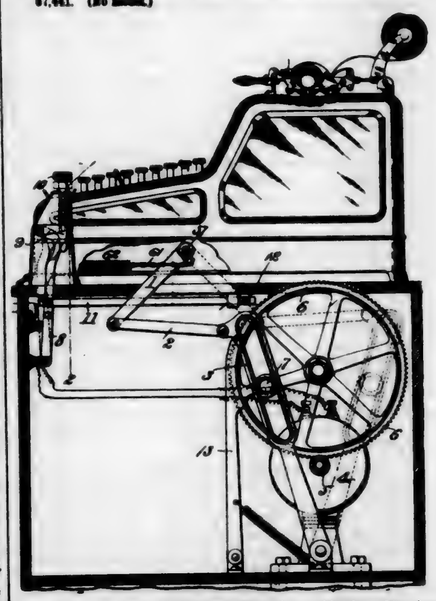
14. In signal apparatus, the combination of transient clear and danger signals, an armature controlling said signals, permanent magnets between which said armature vibrates, a set of conductors leading to the track and engaging the same, one in advance of the other, said conductors being connected with helices for maintaining the armature in a given position, a third conductor engaging the track in the rear of said first-named conductors and connected with one of said first-named conductors through the medium of a helix wound to produce the same polarity as the first-named helices, a track having two insulated rail-sections simultaneously engaged by two of said conductors, a signal-controlling generator connected with two of said rail-sections and forming therewith a local partial circuit, and means for disconnecting each pole of said local generator from its rail-sections and connecting the same with the rail-section of the other pole, whereby the direction of current through said train-carried conductors may be changed, substantially as described.

15. In signal apparatus wherein are employed rail-sections separated by points of insulation, a battery connected with two rail-sections on opposite sides of a point of insulation, a switch in the partial circuit thus formed and an electromagnetic instrument connected with said last-named rail-sections and bridging the point of insulation between the same, said instrument serving to hold said switch normally closed, substantially as and for the purpose set forth.

16. In signal apparatus, the combination of insulated track-rail sections, a signal-controlling electric source connected with two sections located one in advance of the other and forming therewith a local partial circuit, an electric source connected with the advance ends of two sections belonging to different track-rails, means for changing the pole connections of said first-named electric source, transient, clear and danger signals, electrically-controlled mechanism for changing the signals, and conductors leading therefrom to the track and engaging the track, one in advance of the other, substantially as and for the purpose set forth.

17. In signal apparatus, the combination of a series of blocks with suitable insulated track-rail sections, a track-battery connected with both track-rails at each block-junction, a signal, a signal-controlling battery for each block-junction, a pole-changer for each track-battery, and electromagnetic mechanism connected with both rails at each block-junction and controlling the pole-changer and the circuit of the signal-controlling battery at said block-junction.

709,244. **CALCULATING-MACHINE.** FRANK C. REDDEN, St. Louis, Mo., assignor to Universal Accountant Machine Company, St. Louis, Mo., a Corporation of Missouri. Filed July 5, 1901. Serial No. 67,441. (No model.)



Claim.—1. In a calculating-machine, the combination with a keyboard, of registering and recording mechanisms, a rock-shaft for driving said mechanisms, a rock-arm on said shaft, a master-gear provided with a crank-pin, connections between said crank-pin and rock-shaft, a motor for driving said master-gear manually operable, means for completing the circuit through, of effecting the energization of said motor, and means operated by said motor for deenergizing the same; substantially as described.

2. In a calculating-machine, the combination with registering and recording mechanisms, of a master-gear for operating the same, a motor for driving said master-gear part of a revolution, and means independent of the motor, and in which power is stored by said motor for causing said gear to complete its revolution; substantially as described.

3. In a calculating-machine, the combination with registering and recording mechanisms, of a master-gear for operating the same, and a motor for driving said master-gear part of a revolution and for storing up power which becomes effective, when the motor is ineffective, to drive the master-gear to complete its revolution; substantially as described.

4. In a calculating-machine, the combination with registering and recording mechanisms, of a master-gear for operating the same, a motor

for driving said master-gear part of a revolution, and a spring in which power is stored by the motor in said action, said spring becoming operative to impart motion to said gear and cause it to complete its revolution; substantially as described.

5. In a calculating machine, the combination with registering and recording mechanisms, of a master-gear for operating the same, a motor for driving said master-gear a part of a revolution, said motion storing up power which becomes effective to drive the gear to complete its revolution, and means for rendering the motor ineffective when it has driven the gear part of a revolution; substantially as described.

6. In a calculating-machine, the combination with registering and recording mechanisms, of a power-shaft for driving the same, a master-gear for rocking said power-shaft, a motor for driving said master-gear part of a revolution, means for storing up power by such operation, and devices for disengaging the motor when it has driven the master-gear part of a revolution, whereby said stored power becomes effective to drive the gear to complete its revolution, and to restore the power-shaft and the connections therebetween and the motor to their normal position; substantially as described.

7. In a calculating-machine, the combination with registering and recording mechanisms, of a rock-shaft for driving the same, an arm on said shaft, an electric motor, connections between said motor and said arm for rocking the latter, a device in the motor-circuit accessible to the operator for completing the motor-circuit, means operated by the rock-arm as it approaches the end of the first half of its stroke, for breaking the circuit, and means in which power is stored during the second period of operation by the motor, which power becomes effective for driving the rock-arm the second half of its stroke independently of the motor; substantially as described.

8. In a calculating-machine, the combination with registering and recording mechanisms, of a power-shaft for driving the same, a motor, connections between said motor and power-shaft, in which connections is included a rock-arm on the power-shaft, a switch for cutting the motor in or out of circuit, and an arm connected to said switch and provided with a projection in the path of said rock-arm, whereby the switch is automatically operated when said rock-arm is at one extremity of its movement, substantially as described.

9. In a calculating-machine, the combination with registering and recording mechanisms, of a power-shaft for driving the same, a motor, connections between said motor and said power-shaft, a switch, an arm connected to said switch and provided with a projection, through the instrumentality of which said switch is automatically operated by the connections between the motor and the power-shaft, a dog cooperating with the switch, and a key for operating the dog, substantially as described.

10. In a calculating-machine, the combination with registering and recording mechanisms, of a power-shaft for driving the same, a motor for driving a master-gear, suitable connections between said master-gear and power-shaft, a brake for the master-gear, a switch for cutting the motor in or out of circuit, means for operating the switch when the master-gear has made part of a revolution, and a spring connected to the power-shaft for returning the parts to a normal or home position, substantially as described.

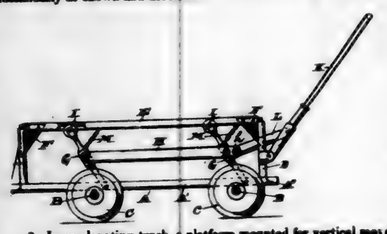
11. In a calculating-machine, the combination with registering and recording mechanisms, of a power-shaft for driving the same, a motor, a master-gear driven by said motor, a brake normally cooperating with said master-gear, a switch for cutting the motor in circuit, connections between said master-gear and power-shaft whereby the power-shaft is positively driven in one direction, means for automatically operating the switch and cutting the motor out of circuit, a brake tending to overcome the momentum of the parts, and a spring for restoring the parts to a normal or home position, substantially as described.

12. In a calculating-machine, the combination with registering and recording mechanisms, of a power-shaft for driving the same, a motor, connections between the master-gear and said power-shaft, a switch for cutting said motor in or out of circuit, and a key or lever accessible to the operator of the machine for operating said switch, substantially as described.

709,245. ELEVATING-TRUCK. ALEXANDER A. SCOTT, Knoxville, Tenn. Filed Jan. 11, 1902. Serial No. 89,262. (No model.)

Claim.—1. In an elevating-truck, a platform mounted for vertical movement, arms pivoted to the base of the truck having their upper ends bearing against and adapted to slide on the bottom of said platform, and means to cause said arms to swing parallel with each other, substantially as shown and described.

2. In an elevating-truck, platform-beams made of channel-steel and mounted for vertical movement, arms pivoted to the base of the truck having one end constructed to travel in the channels of said platform-beams, and means to cause said arms to swing parallel with each other, substantially as shown and described.



3. In an elevating-truck, a platform mounted for vertical movement, arms pivoted to the base of the truck, wheels journaled in said arms to bear against the bottom of said platform, and means to cause said arms to swing parallel with each other, substantially as shown and described.

4. In an elevating-truck, a platform mounted for vertical movement, arms pivoted to the base of the truck and adapted to swing parallel with each other, wheels journaled in said arms to bear against the bottom of said platform, rods pivotally connecting said arms in pairs, and a lever connected to said rods, substantially as shown and described.

5. In an elevating-truck, a platform mounted for vertical movement, arms pivoted to the base of the truck to bear against the bottom of said platform, a chain connecting each arm with the platform, and means to cause said arms to swing parallel with each other, substantially as shown and described.

6. In an elevating-truck, a platform mounted for vertical movement, arms pivoted to the base of the truck to bear against the bottom of said platform and adapted to swing parallel with each other, a chain connecting each arm with the platform, rods pivotally connecting said arms in pairs, and a lever connected to said rods, substantially as shown and described.

7. In an elevating-truck, a rectangular base, uprights rising therefrom, platform-beams mounted for vertical movement in said uprights, arms pivoted to said base, wheels journaled in said arms to bear against the bottom of said platform-beams, and means to cause said arms to swing parallel with each other, substantially as shown and described.

8. In an elevating-truck, a rectangular base, uprights rising therefrom, platform-beams mounted for vertical movement in said uprights, arms pivoted to said base, wheels journaled in said arms to bear against the bottom of said platform-beams, rods pivotally connecting said arms in pairs, and a lever connected to said rods, substantially as shown and described.

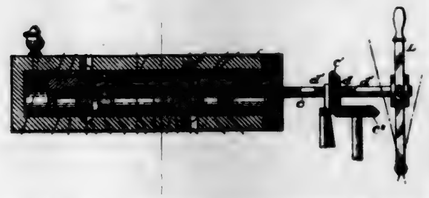
9. In an elevating-truck, a rectangular base comprising side beams made of channel-steel and end beams, uprights rising from said base made of channel-steel, platform-beams made of channel-steel mounted for vertical movement in said uprights, arms pivoted to the side beams of said base, wheels journaled in said arms to run in the channel of the platform-beam and bear against the top of said channel, and means to cause a simultaneous swinging of said arms through an arc, substantially as shown and described.

10. In an elevating-truck, a rectangular base comprising side beams made of channel-steel and end beams, uprights rising from said base made of channel-steel, platform-beams made of channel-steel mounted for vertical movement in said uprights, arms pivoted to the side beams of said base, wheels journaled in said arms to run in the channel of the platform-beam and bear against the top of said channel, rods pivotally connecting said arms in pairs, and a lever connected to said rods, substantially as shown and described.

11. An elevating-truck comprising an open rectangular frame mounted on wheels, channeled uprights rising from said frame, horizontal channeled beams comprising the platform, flat pieces of metal secured at the ends of each platform-beam, said pieces of metal bearing in said channeled uprights, arms pivoted to said rectangular frame, a wheel journaled in each arm to bear in the channel of the platform-beam, a chain connecting each arm with the platform-beam, and means to cause a simultaneous swinging of said arms through an arc, substantially as shown and described.

12. An elevating-truck comprising an open rectangular frame mounted on wheels, channeled uprights rising from said frame, horizontal channeled beams comprising the platform, flat pieces of metal secured at the ends of each platform-beam, said pieces of metal bearing in said channeled uprights, arms pivoted to said rectangular frame, a wheel journaled in each arm to bear in the channel of the platform-beam, a chain connecting each arm with the platform-beam, rods pivotally connecting said arms in pairs, a lever pivoted to the front uprights, and a link connecting the lever with each said rod, substantially as shown and described.

709,246. VALVE FOR FLUID-PRESSURE ENGINES. PHILIP T. STILLMAN, Elizabeth, N. J. Filed June 15, 1901. Serial No. 64,694. (No model.)



Claim.—1. In a steam or other fluid-pressure engine, the combination of a cylindrical valve seat or casing having admission, exhaust and cylinder ports permanently acting as such while the engine is running in either direction, and a continuously-rotating axially-movable valve seated in the casing and controlling the respective ports therein to reverse the engine by axial movement of the valve.

2. In a steam or other fluid-pressure engine, the combination of a cylindrical valve seat or casing having admission, exhaust and cylinder ports, and a continuously-rotating axially-movable valve seated in the casing and having heads connected by a diametric web and formed with peripheral apertures and chambers for the purposes set forth.

3. In a steam or other fluid-pressure engine, the combination of a cylindrical valve seat or casing containing an admission-port communicating with an interior annular groove, an exhaust-port also communicating with an interior annular groove, and cylinder-ports intermediate the two grooves, and a continuously-rotating axially-movable valve having heads connected by a diametric web and containing peripheral apertures and chambers communicating therewith extending beyond the heads toward the transverse center line of the valve for the purpose set forth.

4. In a steam or other fluid-pressure engine, the combination of a cylindrical valve seat or casing having admission, exhaust and cylinder ports, and a continuously-rotating axially-movable valve seated in the casing, means for varying the normal relation of the valve, in its rotation, to the cylinder-ports to obtain a "lead."

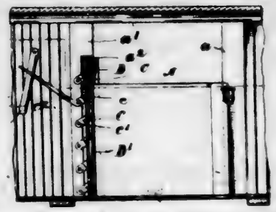
5. In a steam or other fluid-pressure engine, the combination of a cylindrical valve seat or casing having an admission-port communicating with an interior annular groove, an exhaust-port communicating with an interior annular groove and cylinder-ports intermediate said grooves, and a continuously-rotating axially-movable valve seated in the casing, comprising a central diametric web and cylindrical heads coöperating respectively with the admission and exhaust ports and each having a peripheral aperture, and a contained chamber extending axially beyond the head, the operation being substantially as described.

6. In a steam or other fluid-pressure engine, the combination of a cylindrical valve seat or casing having an admission-port communicating with an interior annular groove, an exhaust-port communicating with an interior annular groove and cylinder-ports intermediate said grooves, and a continuously-rotating axially-movable valve seated in the casing, comprising a central diametric web and cylindrical heads coöperating respectively with the admission and exhaust ports, and each having a peripheral aperture and a contained chamber extending axially beyond the head, and cut-off plates attached to the central web and coöperating with the cylinder-ports to determine the cut-off, the operation being substantially as described.

7. In a steam or other fluid-pressure engine, the combination with a valve seat or casing having an admission-port, an interior annular passage or groove into which it opens, an exhaust-port, an interior annular groove into which it opens and cylinder-ports, of a continuously-rotatable axially-movable valve seated therein and constructed to coöperate with the respective ports in the casing for the purpose set forth.

8. In a steam or other fluid-pressure engine, the combination with a valve seat or casing having an admission-port, an interior annular passage or groove into which it opens, an exhaust-port, an interior annular groove into which it opens and cylinder-ports, of a continuously-rotatable axially-movable valve seated in the casing and having two parts respectively coacting with the admission and exhaust ports to control the passage of steam between them and the cylinder-ports, each said part having a solid peripheral portion which in one position cuts off steam from, and in another position permits passage of steam to, a cylinder-port, and a chambered portion with a peripheral aperture, which chambered part in one position cuts off steam from, and in another position permits the passage of steam to, a cylinder-port, whereby the admission-port and exhaust-port constantly act as such when the engine is running in either direction and the engine may be reversed by the axial movement of the valve.

709,247. GRAIN-CAR DOOR. GEORGE BITERNEY, Brandon, Canada. Filed Sept. 13, 1901. Serial No. 75,313. (No model.)



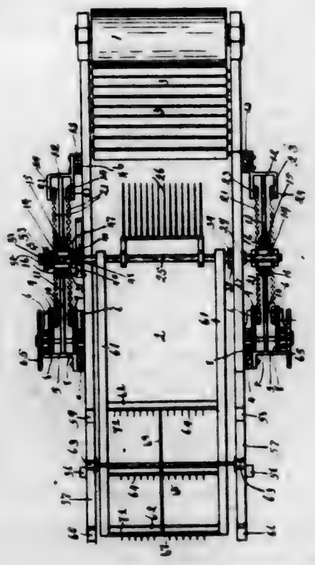
Claim.—1. The combination with the door-body and the door-posts, one of which has a rabbet therein, of a laterally-movable tongue, a series of links pivotally secured at one end to said tongue and at their opposite ends to said door-posts, one of said links being extended to form an operating-lever, and a secondary strip or tongue pivotally secured to said links, the edge of said auxiliary tongue being adapted to abut the edge of said door-body, and a locking-bar pivotally hung at one end upon the wall of the car or the door-post as and for the purpose specified.

2. The combination with the door-body and door-posts, of a laterally-movable tongue, a plurality of links pivotally secured at one of their ends to said tongue and at their other ends to said door-posts, one of said links being extended to form a lever, a locking-bar pivoted to the wall of the car or the door-post, a flange thereon having notches therein adapted to receive the end of the lever as and for the purpose specified.

3. The combination with the door-body and door-posts, of a laterally-movable tongue, a plurality of links pivotally secured at one of their ends to said tongue and at their other ends to said door-post, one of said links being extended to form a lever, and a locking-bar pivotally hung to the wall of the car and having a flange formed on one side and notches or holes formed in said flange, as and for the purpose specified.

4. A fastening device for grain-car doors and the like comprising a fixed tongue secured to the door-body and projecting slightly beyond one edge thereof, a laterally-movable tongue, a series of links pivotally connected at one of their ends to said laterally-movable tongue and at their other ends to the body of the door, a lever formed on the end of one of said links and means for holding said lever in any position to which it may be adjusted as and for the purpose specified.

709,248. PORKING, ELEVATING, AND CONVEYING MACHINE. ARTHUR P. TATTERSON, Stockton, Cal. Filed Dec. 6, 1901. Serial No. 84,927. (No model.)



Claim.—1. In a machine of the class described, the combination with a suitable tub or vat of a shaft journaled on carriages arranged at each end thereof, the said carriages adapted to operate to and fro on tracks arranged at the sides of the tub or vat, a cog-wheel loosely journaled on the shaft aforesaid and adapted to engage with a cog-rack suitably mounted on the tub or vat, a ratchet-wheel rigidly attached to the shaft and adapted to be engaged by pawls pivoted to the said cog-wheel, a suitable fork rigidly attached to the shaft and suitable means for oscillating the said carriages to and fro all arranged and operating substantially as shown and described and for the purposes specified.

2. In a machine of the class described a fork rigidly attached to a shaft which is journaled in suitable bearings on carriages adapted to travel to and fro and suitable means for revolving said shaft, simultaneously with the forward movement of the carriages, in a manner so that the free ends of the tines of said fork will describe an involute in their rotation around said shaft all arranged and operating substantially as shown and for the purposes specified.

3. In a machine for the automatic washing of wool and analogous materials, a shaft driven intermittently by a cog-wheel which is loosely mounted thereon and adapted to engage a cog-rack, said cog-wheel having two or more pawls pivoted thereto, which are adapted to engage a ratchet-wheel as described, in combination with suitable journals for said shaft mounted on suitable carriages all arranged and operating substantially as shown and described and for the purposes set forth herein.

4. In a machine for washing wool or other analogous material a friction-wheel 48 loosely journaled on the main shaft and adapted to be engaged by a friction, the collar 50 provided with the finger or extension 51, adapted to engage the pin 52 in the side of the friction-wheel 49, rigidly attached to the main shaft aforesaid, said main shaft having a suitable fork rigidly attached and suitable means for operating said shaft all arranged and operating substantially as shown and described and for the purposes specified.

5. In a machine of the class described a ratchet-pawl composed of the curved arm 40 suitably pivoted on the pin or stud 39, and having the slot 41 arranged therein, the two pawls 42 pivoted in said slot, and adapted to engage the teeth of a ratchet-wheel 37, as described, the spring 43 adapted to engage the pawls 42, the pins 45 and 44 inserted in the arm 40 beneath the pawls 42 and over the spring 43 respectively, and the pin or stud 46 inserted in the leg 47 of the arm 40, in combination with the said ratchet-wheel 37 and the shaft 25 having the fork 26 and suitable means of operating said shaft all arranged and operating substantially as shown and for the purposes specified.

6. In a machine of the class described the mode of propelling the shaft 25 and its carriages, comprising the yoke 17 having the block 18 located between its parts, the pin 19 inserted through said block 18, the link-belt links 20, having the lugs 22 on one side, attached one on each end of the pin 19 and forming a part of the two link belts, said link belts 21 adapted to run over sprockets suitably journaled and suitable means of imparting motion to said sprockets all arranged and operating substantially as shown and for the purposes specified.

7. In a machine of the class described, the spring-teeth 30 inserted in the bar 27 and having the coil or helical spring 31 adapted to compressed the same and bear against the pin 32, said teeth 30 being placed a suitable distance from the cog-rack 28 the bar 27 adapted to receive the teeth 30, said rack 28 attached to said bar 27 and the cog-wheel 29 which is adapted and calculated to travel toward said cog-rack, in combination with a suitable shaft suitably journaled on carriages and having a fork rigidly attached thereto, all arranged and operating substantially as shown and described and for the purposes specified.

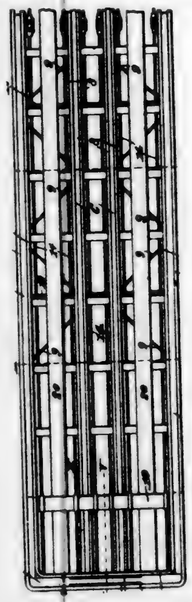
8. In a machine of the class described the combination of a suitable fork 26 rigidly attached to a shaft arranged transversely on a tub or vat, said shaft, journaled at each end in boxes mounted on independent carriages, arranged on opposite sides of the said tub or vat, the said carriages, which are adapted to operate to and fro on horizontal tracks rigidly attached on the sides of the tub or vat, the yoke 17 suspended from and rigidly attached to the said carriages and having the slot therein, the block 18 inserted in the yoke 17, the pin 19 introduced into an opening in the block 18, and having right and left screw-threads cut on either end thereof, the link-belt links 20 22 adapted to engage the said pin 19, said link-belt links 20 22 being embodied in the link belts 21, said link belts 21 taking over the sprocket-wheels 23 and 10, said sprocket-wheels 23 and 10 suitably journaled on brackets, the cog-wheels 9 rigidly attached to the sprockets 10, the cog-wheels 8 rigidly attached to a shaft 7 and engaging the wheels 9, said shaft 7 journaled on a bracket at the side of the tub or vat and suitable means for rotating said shaft 7 and the shaft 25, all arranged and operating substantially as shown and described, and for the purposes specified.

9. In a machine of the class described the combination with a suitable tub or vat of the shaft 25, having the fork 26, journaled on carriages 15 arranged on either side of the said tub or vat, said carriages 15, each mounted on a track and propelled to and fro by two link belts 21 which have the links 20 22 in their length, suitable power engaging said link belts, a cog-wheel 29 loosely journaled on the said shaft 25 and having the pawls 35, the ratchet-wheel 34 rigidly attached to the shaft 25, and adapted to be engaged intermittently by the said pawls, a suitable cog-rack 28 mounted on the said tub or vat, and adapted to engage the cog-wheel 29, the spring-teeth 30 31 32 located immediately in front of the cog-rack 28 and adapted to regulate the cog-wheel 29 for engagement with the said cog-rack 28, all arranged and operating substantially as shown and described and for the purposes set forth herein.

10. In a machine of the class described the combination with a suitable tub or vat, a fork and its shaft suitably mounted on carriages adapted to be propelled to and fro and suitable means for rotating said shaft and fork, of a rake composed of two arms 61 journaled at one end to the said fork-shaft, and having suitable cross-bars attached thereto, the free end being supported on tracks 63 adapted to rest on the track 57 58 60, said trank 58 60 having the tilting rail 57 angular in form pivoted on the post 56, the rock-shafts 72 journaled in the arms 61 and adapted to support rakes or forks 64, said rakes or forks which are rigidly attached thereto and depend therefrom, the arms 67 rigidly attached to the rock-shafts 72, the rod 69 attached to the free ends of the arms 67, the arm 68 attached to the rod 69 and engaging the pivot 70 73, and said pivot 70 73 all arranged and operating substantially as shown and described and for the purposes specified herein.

11. In a machine of the class described a suitable tub or vat on which a shaft is mounted transversely thereto on carriages, said shaft having a suitable fork rigidly attached thereto, said carriages being adapted to oscillate to and fro on the tub or vat, the chains or belts 21 adapted to engage the carriages, suitable cog-wheels adapted to communicate motion to the said chains or belts, a cog-wheel loosely mounted on the shaft aforesaid and adapted to engage a cog-rack in a manner so as to rotate the shaft intermittently, the friction device 50 51 49 53 55, attached to the said shaft the retaining ratchet-wheel 37 and its double pawls 40 41 42 43 44 45, which are adapted to engage the pin 46, and a rake attached to the said shaft so as to operate to and fro with the same, and suitable means for changing the angle of the forks or rakes, all arranged and operating substantially as shown and for the purposes specified.

709,249. PLATFORM-CAR. ERNEST F. VOGEL and MORITZ WEBER, St. Louis, Mo., assignors to St. Louis Car Company, St. Louis, Mo., a Corporation. Filed Sept. 30, 1901. Serial No. 76,994. (No model.)



Claim.—1. In a platform car, the combination of framework, a pair of border sills extending continuously around said framework and apertured at the ends of the car, and strengthening-plates connected to said border sills at the location of said apertures, substantially as described.

2. In a platform-car, the combination of the framework, a pair of border sills extending continuously around said framework and apertured at the ends of the car, fillers positioned between the border sills, strengthening-plates connected to said border sills at the location of said apertures, and extending below the same, and fillers located between the strengthening-plates.

3. In a platform-car, the combination of a pair of continuous border sills, fillers located between the border sills, interior sills arranged in pairs and extending longitudinally of said border sills, and fillers located between said interior sills.

4. In a platform-car, the combination of a pair of continuous border sills, of channel form, fillers located between the border sills, interior sills arranged in pairs and extending longitudinally of said border sills, fillers located between the interior sills and braces located between the border sills and the interior sills.

5. In a platform-car, the combination of a pair of continuous border sills, fillers located between said sills, interior sills arranged in pairs extending longitudinally of said border sills, braces positioned obliquely between said border sills and the interior sills, flooring-strips supported intermediate their ends by said braces, and brackets supporting the flooring-strips at their ends.

709,250. PHOTOGRAPHIC-EXPOSURE METER. RUEL W. WHITNEY, Cleveland, Ohio. Filed Aug. 8, 1901. Serial No. 71,410. (No model.)

Claim.—A photographic-exposure meter comprising a holder having spaced flanges with designations and columns of numerals thereon and adapted to contain a strip of sensitized material, a sliding strip having on one end a color, and a sliding strip provided with columns of numerals, said parts being arranged so as to coact together, substantially as and for the purpose specified.

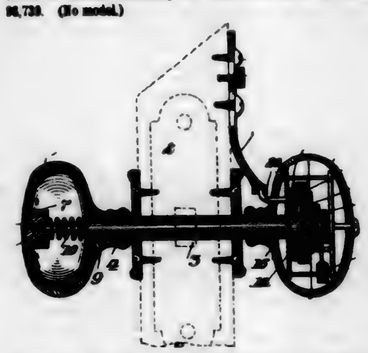
709,251. MITER-BOX. FRANK B. ABBOTT and ELMER H. RANDS, Pittsburg, Pa. Filed Mar. 5, 1902. Serial No. 97,242. (No model.)

Claim.—1. In a miter-box, the combination of two angle-iron sections hinged upon a central standard, a hinged extension connected to one of said sections, a segmental guide connecting said extension and said section, a guide carrying a slide and standard secured on said slide, arms pivotally connected to said slide and said sections, substantially as described.

2. In a miter-box, the combination of two angle-iron hinged sections, a central standard carrying a collar, arms connected to said collar and said sections, a hinged extension connected to one of said sections, an I-beam guide, a slide mounted thereon carrying a standard, and arms connected to said guide and said sections, substantially as described.

3. In a miter-box, the combination of two angle-iron sections hinged together, a hinged extension connected to one of said sections, means to lock said sections at any desired angle, a central standard, a guide extending therefrom, a slide mounted on said guide, a standard connected to said guide, all parts being arranged and operating substantially as described and for the purpose set forth.

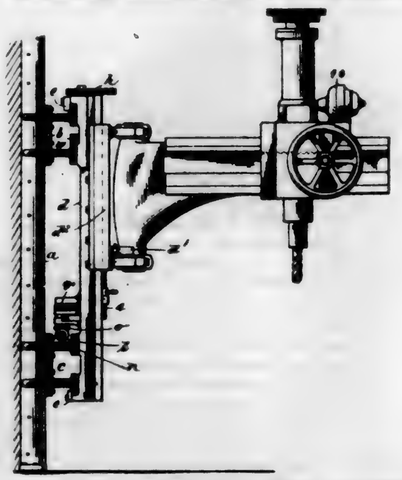
709,252. COMBINATION DOOR-BELL AND BURGLAR-ALARM. FRANK B. ABBOTT, Pittsburg, Pa. Filed Mar. 18, 1902. Serial No. 98,738. (No model.)



Claim.—1. In a door-bell and burglar-alarm, the combination with hollow knobs, a hollow shaft connecting said knobs, a rod extending through said shaft and one of said knobs, a push-button secured to the end of said rod, a clock mechanism secured in one of said knobs, a wheel carrying openings formed therein attached to said clock mechanism, a lever secured to the end of said rod, and means carried by said lever to engage one of said openings, substantially as described.

2. In a door-bell and burglar-alarm, the combination of hollow door-knobs, a hollow shaft connecting said knobs, a clock mechanism secured in one of said knobs, and means to actuate said clock mechanism when one of said knobs is turned, substantially as described.

709,258. MACHINE-TOOL CONSTRUCTION. WILLIAM H. RAUHE, Springfield, Mass. Filed July 31, 1901. Serial No. 70,367. (No model.)



Claim.—1. The combination with a bearing-rail, of a plurality of tool-carrying frames independently slidable on said rail, one driving-shaft common to all of said frames; a bearing for said shaft in each of said

frames; a gear having a splice-and-groove connection with the driving-shaft, means for rotatably supporting said gear on the frame and constituting the bearing for the driving-shaft; means for sliding said frames on the bearing-rail, and a connection between the frame-sliding means and the gear on the driving-shaft, whereby said frame-sliding means may move said frames in opposite directions on the bearing-rail.

2. The combination with a bearing-rail, of a plurality of tool-carrying frames slidable on said rail independently one of the other, one driving member common to all of said frames, a gear on said member slidable thereon and rotatable therewith and a support on the frame for said gear; a rack on said bearing-rail, pinions on said frames, and means of connection between said pinions and the gear on said driving member whereby the pinions may be rotated to move the frames in opposite directions on the bearing-rail.

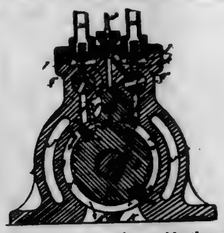
3. The combination with a bearing-rail, of a tool-carrying frame slidable horizontally thereon, a driving member for said frame, a counter-shaft supported on the frame, a tool-carriage on the frame movable vertically thereon, and means for imparting movements thereto, a clutch on said counter-shaft constituting a driving connection between said counter-shaft and the carriage-moving means; devices for moving said frame, and a second clutch on the counter-shaft constituting a driving connection between the counter-shaft and said frame-moving devices, whereby the frame and the tool may be operated separately or together, substantially as described.

4. The combination with a bearing-rail, of a tool-carrying frame slidable horizontally thereon, and means for moving said frame; a driving member for said frame, a counter-shaft supported on the frame, a driving connection between the frame-moving means and said counter-shaft, and a driving connection between said shaft and the driving member whereby said shaft may be either disconnected therefrom or rotated in either direction, substantially as described.

5. The combination with a bearing-rail, of a tool-carrying frame located transversely of said rail, and slidable horizontally thereon, means for moving said frame, a driving member for said frame, a clutch connection between said driving member and said frame-moving means, a tool-carriage supported, and vertically movable on, said frame, and a tool adapted to swing in a horizontal plane mounted on said carriage.

6. Two parallel rails, a plurality of frames supported on said rails transversely thereof, and means for sliding said frames on the rails independently in either direction; carriages on said frames having tools thereon adapted to swing in horizontal planes, and means for moving the carriages vertically; a driving member parallel with said rails and common to all of the frames, a counter-shaft on the frame, and independent means of connection between said shaft and the carriage-moving means, said shaft and the frame-moving means, and said shaft and the driving member, substantially as described.

709,254. ROTARY MOTOR. ALBERT L. REMY, Paris, France. Filed June 13, 1901. Serial No. 64,368. (No model.)



Claim.—1. In a rotary motor, the combination with the outer cylinder A, of the drum B rotatively mounted in the cylinder and provided with two oppositely-disposed pistons c, and the drum D, also rotatively mounted in a recess in the cylinder and in contact tangentially with the drum B, said drum D having a recess to receive the pistons c, of gearing between said drums whereby this drum B drives the drum D, the continuously-rotating valves H driven from the drum D and controlling port-passages to the cylinder, said valves having diametrical ports i, and the gear for driving said valves, substantially as set forth.

2. In a rotary motor, the combination with the cylinder A, of the drum B rotatively mounted therein and provided with oppositely-disposed pistons c, and teeth d which extend the entire length of the drum within the cylinder, and the auxiliary drum D, rotatively mounted in a recess in the cylinder and having teeth e which gear with those on the drum B, of the diametrically-ported valves H, controlling the inlet-passages of the motor, and gearing for continuously rotating said valves H, substantially as set forth.

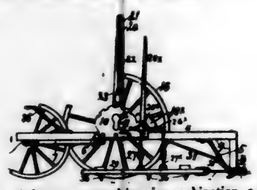
3. In a rotary motor, the combination with the cylinder A, having two always open exhaust-ports, and two inlet-ports, the check-valves o at said inlet-ports, and the continuously-rotating valves H having diametrical ports controlling said inlets, of the rotatively-mounted drum B in the cylinder and provided with pistons c, the auxiliary recessed drum D mounted rotatively in a recess in the cylinder and in peripheral contact with the main drum B, and gearing between the drums B and D, whereby the former drives the latter, substantially as set forth.

709,255. HAIR-PIN. WILLIAM S. BECHTOLD, Newark, N. J. Filed May 2, 1902. Serial No. 105,557. (No model.)

Claim.—1. A hair-pin or like article having its shanks in substantially the same plane the ends of its shanks converging and provided with entering members extended transversely in opposite directions relative to each other and to the plane of the pin, substantially as described.

2. A hair-pin or like article having its shanks in substantially the same plane, the ends of its shanks converging and obliquely directed on opposite sides of the plane of the pin and provided with entering members extending transversely in opposite directions to the plane of the pin, substantially as described.

709,256. HARROW. EDMUND B. BUTTS, Oberon, N. D. Filed June 7, 1901. Serial No. 63,495. (No model.)



Claim.—1. A harrow comprising in combination, a series of harrow-sections adapted to be drawn side by side, a draft-bar link-fastened to the front ends of all the sections, a frame-bar secured with its front end to the middle of the draft-bar and extending upwardly and rearwardly over and beyond the harrow-sections, a driver's seat secured on the frame-bar, a horizontally-swinging arm pivoted under the rear part of the frame-bar and having a transversely-disposed short shaft with carrier-wheels at its ends; the serrated sectors 10, secured at both sides of the frame-bar, rock-shafts 14 extending transversely out from both sides of the frame-bar, near the sector-plates and journaled central with the latter, and carrying levers having latch-operated dogs adapted to engage the serrations of the sectors, ground-wheels 16 supporting the outer ends of the shafts 14, and adjustable arms, 26, link-fastened to the harrow-sections, and the braces 32 between the draft-bar and the shafts 14, substantially as and for the purpose set forth.

2. A harrow having a longitudinally-disposed elongated supporting-frame with a horizontally-swinging arm pivoted with its front end under the rear end of the frame, and provided at its rear end with a short axle having two ground-wheels traveling behind the harrow-sections.

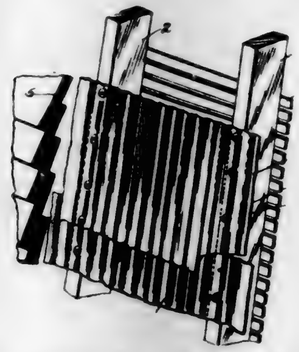
3. In a harrow, the combination with a supporting-frame having the sector-plates 10 with serrations and each with a central vertical slot enlarged at its upper end, of the side shaft 14 having the neck 15 and head 13 and latch-lever with dog adapted to engage the serrations of the sector when the neck of the shaft is journaled in the narrow bottom end of the slot, and wheels supporting the outer ends of the shafts.

4. A harrow-frame having side bearings for side shafts to extend in opposite directions from the frame, and shafts journaled each with one end in such bearings, said journals consisting of an annular groove formed near the end of the shaft, and said bearing consisting of a plate having a vertically-elongated hole enlarged at its upper end for the insertion of the end of the shaft till its neck can be placed in the narrow bottom end of the slot which serves as its bearing.

709,257. CONSTRUCTION OF BUILDINGS. CHARLES E. COUTTRELL, Minneapolis, Minn. Filed Dec. 23, 1901. Serial No. 86,916. (No model.)

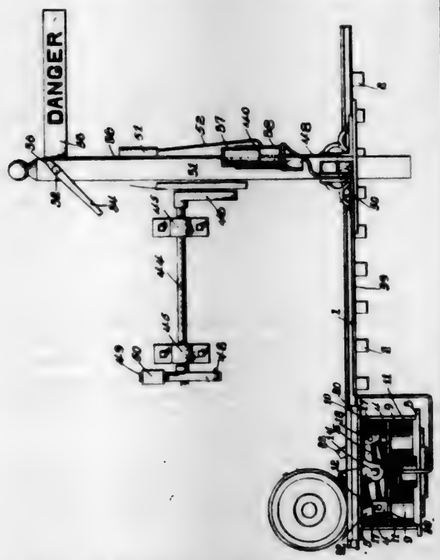
Claim.—1. In a building construction the combination with the boarding, of a lining arranged at the inner side thereof and consisting of crinkled or corrugated paper, substantially as set forth.

2. In a building construction the combination with the boarding, of a paper lining arranged at the inner side thereof and consisting of paper crinkled or corrugated longitudinally and transversely, substantially as set forth.



3. In a building construction the combination with the boarding, of a lining arranged at the inner side thereof and consisting of a plurality of layers of paper at least one of which is crinkled or corrugated, whereby it is rendered expansible and a dead-air space is formed between the layers of paper, substantially as set forth.

709,258. PNEUMATIC RAILWAY-SIGNAL. CYRUS S. DEAN, Port Erie, Canada. Filed Nov. 27, 1901. Serial No. 83,863. (No model.)



Claim.—1. In a railway signaling device, rails, a pneumatic-operated signal, a plurality of air-compressing cylinders, a walking-beam, having connection with the pistons of said cylinders and operating-bars connecting to the extremes of the walking-beam and extending above the rails, whereby the walking-beam is rocked from a passing train.

2. In a railway signaling device, a signal, air-actuated means for operating said signal, an air-compressing device having a plurality of air-cylinders, pistons in said cylinders, a walking-beam having connection with said pistons, operating-bars connecting to the extremes of the walking-beam, and compressed-air-conveying means connecting the cylinders to the air-actuated signal-operating means.

3. In a railway signaling device, a signal, air-actuated means for operating said signal, an air-compressing device having a pair of air-compressors and a reservoir connecting with said compressors, a walking-beam having operative connection with the air-compressors and operating-bars connecting to the walking-beam and adapted to be moved by a passing train to rock the walking-beam.

4. In a railway signaling device, a pneumatic-operated signal, an air-compressing device having a pair of air-compressors adapted to supply air to said pneumatic-operated signal, a walking-beam having operative connection with the air-compressors and operating-rods pivoted at their lower ends to the walking-beam and adapted to be moved by a passing train to rock the walking-beam.

5. In a railway signaling device, a main signal, pneumatic mechanism for operating said main signal including a tubular support, an air-bell operatively connected to said main signal and telescoping in the tubular support, a whistle and a pipe extending from the whistle and connecting to the tubular support, substantially as set forth.

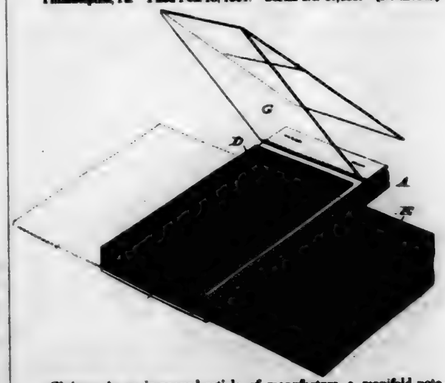
6. In a railway signaling device, a main signal, pneumatic mechanism for operating said main signal including a tubular support, an air-bell operatively connected to said main signal and telescoping in the tubular support, a whistle and a pipe extending from the whistle and connecting to the tubular support at a point below the air-bell when in its elevated position, substantially as set forth.

7. In a railway-signal, air-compressors, a post, a signal operatively supported from the post, an air-bell having connection with the signal, a tubular support for the air-bell having pipe connection with the air-compressors and an opening in its side wall, and a locking device having a lever adapted to project through the opening and catch beneath the air-bell when in its elevated position, substantially as set forth.

8. In a railway-signal, air-compressors, a post, a signal operatively supported from the post, an air-bell having connection with the signal, a tubular support for the air-bell having pipe connection with the air-compressors and an opening in its side wall, a locking device having a lever adapted to project through the opening and catch beneath the air-bell when in its elevated position, and automatic means for retracting said lever, substantially as set forth.

9. In a railway-signal, air-compressors, a post, a signal operatively supported from the post, an air-bell having connection with the signal, a tubular support for the air-bell having pipe connection with the air-compressors, and a locking device having a lever adapted to engage the air-bell when in its elevated position, substantially as set forth.

709,259. MANIFOLDING NOTE-BOOK. WILLIAM F. ROELKE, Philadelphia, Pa. Filed Feb. 13, 1901. Serial No. 47,155. (No model.)



Claim.—As an improved article of manufacture, a manifold note-book comprising a back, a series of long and short leaves alternately bound at one end, carbons attached to said back on lines at right angles to the line of binding of said leaves, to fold in opposite directions from opposite edges, the short leaves constituting each a fixed leaf, and its stub integral and permanently secured in position, the long leaves constituting each a section independent of the fixed leaf and having a weakened line separating it from its stub, and a section readily separable from the first-mentioned section and having a weakened line forming readily-separable portions of different lengths foldable upon the separable first-mentioned section and with it foldable over the fixed leaf, the said cartons being foldable the one over the fixed leaf and the other between the sections of the separable leaf, all substantially as shown and described.

709,260. RESERVOIR-PEN. ROBERT T. GILLESPIE, Rochester, Pa. Filed May 15, 1901. Serial No. 60,316. (No model.)

Claim.—1. A penholder consisting of a ferrule provided with a socket for the pen-point and means for limiting its inward movement therein, a lid pivotally mounted between the sides of the ferrule adapted to be folded upon the pen-point and to form with it an ink-holding cavity, such lid being provided with circulation-apertures for the purpose specified, a lifting extension and a spring-bearing shoulder by which the lid is held in a lowered or raised position respectively, and a flat spring adapted to bear against such shoulder secured in the interior of the ferrule, substantially as set forth.

2. A penholder consisting of a ferrule provided with a socket for the pen-point and means for limiting its inward movement therein, a lid pivotally mounted between the sides of the ferrule adapted to be folded upon the pen-point and to form with it an ink-holding cavity, such lid being provided with a tubular reservoir portion, a lifting extension, spring-bearing shoulders by which the lid is held in a lowered or raised position respectively, and a flat spring adapted to bear against such shoulders secured in the interior of the ferrule, substantially as set forth.

3. A penholder consisting of an outer ferrule, and an inner ferrule inserted therein provided with a retaining-lip, an intervening cavity for the insertion of the pen-point, a pin connecting the ferrules together, with a lid pivotally mounted upon the pin between the sides of the inner ferrule, adapted to be closed downwardly and to form with the pen-point an ink-holding cavity, with means for holding the lid in a raised or lowered position, substantially as set forth.

4. A penholder consisting of an outer ferrule, and an inner ferrule inserted therein provided with a retaining-lip, an intervening cavity for the insertion of the pen-point, a pin connecting the ferrules together, with a corrugated lid pivotally mounted upon the pin between the sides of the inner ferrule adapted to be closed downwardly and to form with the pen-point an ink-holding cavity, with means for holding the lid in a raised or lowered position, substantially as set forth.

709,261. **MEANS FOR OPERATING GATES FOR RAILWAY-CARS.** EDWARD R. GOLD, New York, N. Y. Filed Oct. 16, 1901. Serial No. 78,898. (No model.)

Claim.—1. The combination of a double gate comprising two leaves hinged together, the primary leaf being hinged to a support, of operating means engaging the primary leaf and movable to swing it around its hinge-axis, and connected to the secondary leaf to fold it toward the primary leaf to open the gate.

2. A double railway-car gate comprising two leaves hinged together, the primary leaf being hinged to a support, combined with operating means connected to the primary leaf and movable to swing it around its hinge-axis, and means arranged within the closed position of the gate, connected to the secondary leaf and adapted to fold it toward the primary leaf to open the gate.

3. The combination of a double gate comprising two leaves hinged together, the primary leaf being hinged to a support, of operating means arranged within the closed position of the gate, connected to both leaves and movable to swing the primary leaf around its axis and to simultaneously fold the secondary leaf against the primary leaf to open the gate.

4. The combination of a double gate comprising two leaves hinged together, the primary leaf being hinged to a support, of operating means comprising an adjusting part movable relatively to the primary hinge, a link connecting said part to the primary leaf, and an operative connection from said part to the secondary leaf, adapted to fold it toward the primary leaf as the latter swings open.

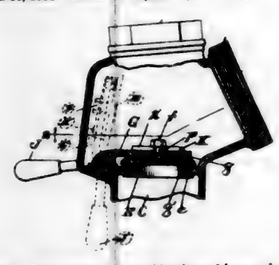
5. The combination of a double gate comprising two leaves hinged together, the primary leaf being hinged to a support, of operating means comprising a slide movable toward and from the primary hinge, a link connecting said slide to the primary leaf, an operating part for moving said slide, and an operative connection from said slide to the secondary leaf adapted to fold it toward the primary leaf as the latter swings open.

6. The combination of a double gate comprising two leaves hinged together, the primary leaf being hinged to a support, of operating means comprising a slide movable toward and from the primary hinge, a link connecting said slide to the primary leaf, an operating-lever for moving said slide, and an operative connection from said slide to the secondary leaf comprising a link extending approximately parallel with the primary leaf, said means adapted to fold the secondary leaf toward the primary leaf as the latter swings open.

7. The combination of a double gate comprising two leaves hinged together, the primary leaf being hinged to a support, of operating means comprising a slide movable toward and from the primary hinge, a link connecting said slide to the primary leaf, an operating-lever for moving said slide, and an operative connection from said slide to the secondary leaf comprising an arm projecting from the secondary leaf, and a link connecting said arm to said slide.

8. The combination of a double gate comprising two leaves hinged together, the primary leaf being hinged to a support, of operating means comprising a slide movable toward and from the primary hinge, a link connecting said slide to the primary leaf, an operating-lever having a toggle connection with said slide adapted to lock the slide in the closed position of the gate, and an operative connection from said slide to the secondary leaf adapted to fold it toward the primary leaf as the latter swings open.

709,262. **ONE-WAY VALVE.** ROBERT H. GOLD, Chicago, Ill. Filed Oct. 16, 1901. Serial No. 78,901. (No model.)



Claim.—1. In a valve, the combination with a casing, of a main valve seated therein, means for opening said main valve, a lost-motion connection between said main valve and said valve-opening means, a bleeding-port through said main valve, and at one side of the center thereof, a bleeding-valve carried by said valve-opening means and arranged to close said bleeding-port, and coengaging means upon said main valve and said valve-opening means to insure the seating of said bleeding-valve in said bleeding-port, substantially as described.

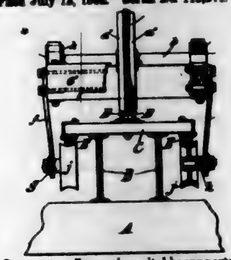
2. In a valve, the combination with a casing, of a valve-seat, a main valve arranged to be seated thereon, a valve-stem carried by said main valve, a lifting-arm journaled in one side of said casing, a lever-arm loosely engaging said valve-stem, a stop carried by said valve-stem to provide a lost motion between said valve and said lever-arm, a bleeding-port at one side of said valve-stem, and a bleeding-valve carried by said lever-arm, substantially as described.

3. In a valve, the combination with a valve-casing, of a main valve seated therein, an arm journaled in one side of said casing, a lost-motion connection between said arm and said valve, a bleeding-port at one side of said connection, a bleeding-valve carried by said arm and arranged to close said port, a spindle rigidly attached to the journaled end of said arm and extending through said casing, and means attached to the external end of said spindle for manually opening the said valve, substantially as described.

4. In a valve, the combination with a casing, of a main valve seated therein, a valve-stem carried by said main valve, an arm journaled within said casing, and at one side of said valve, a lost-motion connection between said arm and said valve-stem, a bleeding-port located at one side of said valve-stem, a bleeding-valve carried by said arm and arranged to close said bleeding-port, means connected with the journaled end of said arm for manually operating said valve, substantially as described.

5. In a valve, the combination with a casing, provided with an inlet and an outlet port, of a main valve arranged to close said outlet-port, an arm journaled within said casing, at one side of said main valve and opposite to said inlet-port, a lost-motion connection between said arm and said main valve, a bleeding-port at one side of said connection, a bleeding-valve carried by said arm and arranged to close said bleeding-port, and means for manually swinging said arm upon its journaled end so as to successively open first the bleeding-valve and then the main valve, and then to swing the valve mechanism to one side of said casing and away from said inlet-port, substantially as described.

709,263. **MONORAILWAY.** EDWARD A. GREEN, Battlecreek, Mich., assignor to American Construction Company, a Corporation of Delaware. Filed July 12, 1902. Serial No. 115,371. (No model.)



Claim.—1. In a monorailway, the suitably supported above the road-bed level, a main traction-rail presenting two parallel traction-surfaces and a channel dividing them, guide-rails presenting downwardly a single traction-surface pendent from the lower side of said ties on each side of and equidistant from said main traction-rail, in combination with a car running-gear comprising main traction-wheels having two traction-surfaces and an intermediate flange, a car-truck suspended from the axles of said wheels, pendent rigid supports carried by said truck, immovable bearings carried thereby and guide-wheels mounted upon said bearings and adapted to come into but normally out of engagement with said guide-rails, the peripheries of said guide-wheels being concave and arched to conform substantially to the arc inscribed by their bearings upon the oscillation of the car-truck.

2. In a monorailway, ties suitably supported above the road-bed level, a main traction-rail presenting two parallel traction-surfaces and a channel dividing them, guide-rails presenting downwardly a single traction-surface pendent from the lower side of said ties on each side of and equidistant from said main traction-rail, in combination with a car running-gear comprising main traction-wheels having two traction-surfaces and an intermediate flange, journal-bearings for the axles of said wheels, pedestal-yokes inclosing said bearings, a resilient buffer disposed between the top of said bearings and said pedestal-yokes, a car-truck suspended from said pedestal-yokes, pendent rigid supports carried by said truck, immovable bearings carried thereby and guide-wheels mounted upon said bearings and adapted to come into but normally out of engagement with said guide-rails, the peripheries of said guide-wheels being concave and arched to conform substantially to the arc inscribed by their bearings upon the oscillation of the car-truck.

709,264. **PUSH-RAKE.** HENRY GRIMM, Pekin, Ill., assignor to the Acme Harvester Company, Pekin, Ill., a Corporation of Illinois. Filed Feb. 1, 1901. Serial No. 46,003. (No model.)

Claim.—1. A push-rake consisting of a supporting-frame, a rake-head at the forward end thereof, a lifting mechanism for raising said head, the same consisting of an unyielding connection pivotally attached to the said rake-head and extending toward the rear of said supporting-frame, a draft-bar at the rear of the said frame the same being slidable thereon, but held rigidly at right angles to the length of the machine at all times and having connection with such rake-head lifting mechanism for raising the rake-head when moved forward by the pull of the horses.

2. A push-rake consisting of a supporting-frame, a rake-head at the forward end thereof and having the usual rake-teeth, lifting mechanism on the frame, the same consisting of an unyielding connection for raising the latter, a draft-bar to which said connection is attached, said bar being slidably mounted on the rear end of the frame and held at right angles to the length of the machine at all times, a hand-lever also at the rear end of the said frame, the same having pivotal connection with the said draft-bar and adapted to assist in lifting the rake-head, and means for locking the draft-bar in either of its two extreme positions for the purposes described.

3. A push-rake consisting of a supporting-frame, a rake-head at its forward end, lifting mechanism on the frame for operating the said rake-head, a hand-lever at the rear of the said supporting-frame and having connection with the said lifting mechanism, a single draft-bar having connection with said lever, a detent pivotally attached to the lower end of the lever, a rigid stop for engaging said detent and a tripping device for releasing the detent from the stop for the purposes set forth and described.

4. A push-rake consisting of a supporting-frame, a rake-head at its forward end, mechanism for raising and lowering said rake-head consisting of a connection attached at one end to the rake-head, a lever pivotally supported on the rake-frame and having the other end of the connection attached thereto above the pivotal support of said lever, a draft-bar at the rear end of said frame, said bar pivotally attached to the lever below the supporting-pivot of the latter, said bar being slidable on the frame but held rigidly at right angles to the length of the machine at all times, said connections causing the forward movement of said bar to raise the rake-head, means for locking the draft-bar in its forward position to retain the rake-head in its raised position and a tripping device for releasing said locking means for freeing the rake-head and permitting it to lower to the raking position.

5. A push-rake consisting of a supporting-frame, a rake-head at its forward end, mechanism for raising and lowering said rake-head, which consists of an unyielding pivotal connection pivoted to the rake-head, a draft-bar at the rear end of the said frame, the same being slidable thereon, and having connection with the said mechanism, said draft-bar at all times held rigidly at right angles to the length of the machine, and means for locking the rake-head in both the raised and lowered positions substantially as and for the purposes described.

6. In a push-rake, a supporting-frame, a rake-head at its forward end, mechanism for raising and lowering said rake-head, which consists of an unyielding connection pivotally attached to the rake-head, a single draft-bar at the rear end of the said supporting-frame adapted to have a shifting movement thereon in the direction of the length of the machine but held rigidly at all times at right angles to its direction of movement, said bar having connection with the said raising and lowering mechanism whereby a forward movement of the said draft-bar will raise the rake-head, a hand-lever for assisting the raising movement through the said mechanism with which it is connected, said lever being also attached to the draft-bar, a locking device substantially as described for sustaining the rake-head in the raised position and a tripping device for releasing the locking device for permitting the rake-head and draft-bar to return to their normal position as set forth.

7. A push-rake consisting of a supporting-frame A, a rake-head at its forward end, a rigid draft-bar B at the rear end of the frame, guides for keeping said draft-bar always at right angles to the length of the ma-

chine, mechanism for raising and lowering the said rake-head, pivotal connection between said draft-bar and said mechanism, which consists of a lever pivoted on the supporting-frame and having the said mechanism pivoted thereto above the supporting-pivot thereof, said draft-bar having pivotal connection with the lower end of the lever below said pivotal point whereby a forward movement of the said draft-bar on the frame, due to the pull of the horses, will communicate a reverse direction of movement of the rake-head mechanism and raise the said rake-head, means for locking the latter in the raised position, and a tripping device for releasing the locking means to allow the rake-head to fall, as set forth.

8. A push-rake consisting of a supporting-frame, a rake-head at its forward end, wheels for supporting the said rake-head and permitting it to rock on the axles thereof, means for pivotally connecting that portion of the rake-head behind the supporting-wheels with the said supporting-frame, lifting mechanism for the rake-head consisting of bell-cranks on the forward ends of the frame, having pivotal connection with the rake-head in front of the said supporting-wheels, a reach extending rearwardly from said bell-cranks, a draft-bar on the rake-frame, a lever mechanism connecting the said reach with the draft-bar, the latter having pivotal connection with each lever mechanism, said bar adapted to have a shifting movement on said supporting-frame whereby when moved forward on the frame the rake-head will be elevated, a locking device for sustaining the head in the elevated position and means for disengaging said locking device to permit the said rake-head to reach its normal position, such locking device also preventing the draft-bar shifting to elevate the rake-head when the latter is in said normal position.

9. In a push-rake, the combination of the supporting-frame A, the rake-head at the forward end thereof, lifting mechanism therefor consisting of the bell-cranks J, links K connecting the cranks with the said head, a reach attached to the cranks and extending rearwardly, the hand-lever U pivoted on the frame and having connection with the said reach, the draft-bar S having connection with each lever, the guides 15 and 19 for said draft-bar, a detent 2 connected to the lever, the stop 1 for engaging the said detent, and the trip 11 for raising the detent from the stop all being arranged substantially as and for the purposes set forth and described.

10. In a push-rake, the combination of a supporting-frame, a rake-head pivotally secured thereto at its forward end, means for raising and lowering said head, which consists of an unyielding connection pivoted thereto, a one piece draft-bar slidably mounted on the supporting-frame and connected with the said raising means, means for operating said rake-head whereby a pull on said bar will raise the rake-head and means for locking the bar against movement when the machine is in the act of raking.

11. In a push-rake, the combination of a supporting-frame A, a rake-head at its forward end adapted to rise and fall for the purposes set forth, mechanism for raising and lowering said head which consists of the reaches M pivotally attached to the rake-head, a bail O for supporting the rear ends of the reaches, a lever U pivoted on the supporting-frame, a rod X connecting each lever and reaches at a point above the pivotal support of said lever, a draft-bar S of a single rigid member having draft attachments, said bar adapted to slide on the supporting-frame and connected with the said lever U at a point below the pivotal support thereof, a roller 16 on said bar, guides 15 for said roller, members 18 connected to the bar and extending forward and converging at their forward ends, a link 19 attached to each converging ends, a roller 23 for guiding the link, means for locking the said bar stationary on the frame when the machine is in the act of raking and means for releasing said bar whereby the pull of the horses thereon will raise the rake-head as set forth.

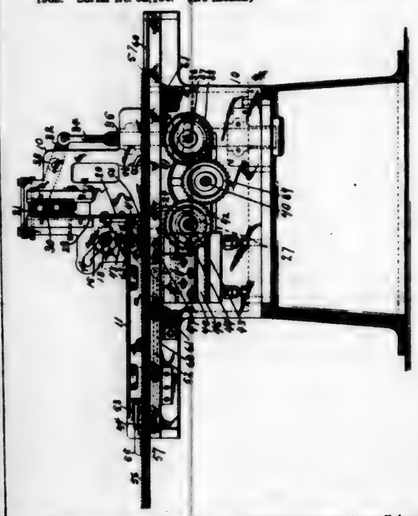
12. In a push-rake the combination of a supporting-frame, a rake-head pivotally attached thereto at its forward end, mechanism connected pivotally to said head for raising and lowering it, a one-piece draft-bar slidably mounted on the supporting-frame to move in the direction of the length of the machine but held rigidly at right angles to the direction of movement said bar having connection with the said rake-head-operating mechanism, a lever pivoted on the frame and having pivotal connection below its point of support with the draft-bar and also having pivotal connection above its support with the said operating mechanism whereby a rearward pull on said lever in conjunction with a forward pull of the horses on the draft-bar will raise the rake-head as set forth.

709,265. TRANSMITTING MECHANISM. CHARLES W. HUNT, West New Brighton, N. Y. Filed Nov. 20, 1900. Serial No. 37,089. (No model.)

Claim.—1. In a device for transmitting power, the combination with a driving and a driven member, of a closed shell adapted for containing a fluid and connected to one of said members, a pump within said shell having its working parts connected respectively with said driving member and said driven member, said pump having inlet and outlet ports communicating with the interior of said shell whereby said shell may deliver fluid to and receive fluid from said pump, means in said outlet-port for regulating the flow, and means to control the rate of circulation of fluid through said pump.

2. In a device for transmitting power, the combination of a driving member, a driven member, a crank secured to one of said members, a closed shell adapted for containing a fluid and secured to the other of said members, a pump within said shell having one of its working parts connected to said crank and the other of said working parts connected to said shell, said pump having inlet and outlet ports communicating with the interior of said shell whereby said shell may deliver fluid to and receive fluid from said pump, means in said outlet-port for regulating the flow, and means to control the rate of circulation of fluid through said pump.

709,266. MATCH-MACHINE. WILLIAM F. HUTCHINSON, Boundbrook, N. J., assignor to Atlas Match Company, Mellenville, N. Y., a Corporation of New Jersey. Filed Mar. 23, 1901. Renewed Feb. 1, 1902. Serial No. 92,196. (No model.)



Claim.—1. A match-machine, comprising a series of parallel guide-fingers, means for feeding veneer strips between the fingers, means for cutting off the strips into splints while in engagement with the fingers, and means for opening and closing the slots between the fingers on the side opposite the cutting mechanism.

2. A match-machine, comprising a series of parallel guide-fingers, means for feeding veneer strips between the fingers, cutting mechanism to sever the splints from the strips while the strips are engaged by the fingers, a carrier movable across the finger ends, means for opening and closing the slots between the fingers on the side opposite the cutting mechanism, and ejecting means for forcing the splints from between the fingers into the carrier.

3. A match-machine, comprising a carrier, a series of guide-fingers perpendicular to the carrier, means for feeding veneer strips between the fingers, cutting mechanism arranged to move opposite one side of the fingers and sever the veneer strips, and a slotted back plate movable across the opposite side of the fingers, the said back plate being arranged to open when the carrier is advanced.

4. A match-machine, comprising a carrier, a series of guide-fingers perpendicular to the carrier, means for feeding veneer strips between the said fingers, cutting mechanism movable on one side of the fingers to sever the veneer strips, a slotted back plate on the opposite side of the fingers, the back plate and cutting mechanism being moved in unison so as to open and close the passage between the fingers and parallel with the plane of movement of the carrier, and means for forcing the severed splints from between the fingers into the carrier.

5. In a match-machine, the combination with a carrier, of four-walled guiding devices to guide the splints to the carrier, one wall of each devices being movable so as to open a passage for the forward movement of the splints after they are engaged by the carrier.

6. A match-machine, comprising a series of stationary guide-fingers adapted to receive veneer strips between them, a series of knife-blades movable across one side of the fingers so as to sever the veneer strips when engaged by the fingers, and a slotted back plate on the opposite side of the fingers, the back plate and knife-blades being movable in unison.

7. A match-machine, comprising a series of stationary guide-fingers adapted to receive veneer strips between them, a series of cutting-blades movable opposite one side of the fingers, a slotted back plate movable across the opposite side of the fingers, the knife-blades and back plate being adapted to open and close the finger-slots, plungers movable between the guide-fingers and parallel therewith, and a carrier movable in a plane perpendicular to that of the plunger and adapted to receive the splints when ejected from between the fingers.

8. A match-machine, comprising a series of stationary guides adapted to hold veneer strips in parallel relation, knife-blades movable across the face of the guides, a series of guide-fingers behind the knife-blades and in line with the guides, a slotted back plate movable behind the guide-fingers, the slots of the back plate registering with the slots between the knife-blades, plungers movable between and parallel with the guide-fingers, and a carrier to receive the match-splints, said carrier moving essentially perpendicular to the travel of the plungers.

709,267. MACHINE FOR BOXING MATCHES. WILLIAM F. HUTCHINSON, Boundbrook, N. J., assignor to Atlas Match Company, Mellenville, N. Y., a Corporation of New Jersey. Filed Mar. 27, 1901. Renewed Feb. 1, 1902. Serial No. 93,197. (No model.)

Claim.—1. A machine of the kind described, comprising an endless belt, a series of guide-plates held longitudinally to the belt and spaced apart so as to hold matches in parallel relation on the belt, and an inclined discharge-chute arranged to receive the matches from the belt, said chute having guide-plates registering with and forming continuations of the guide-plates of the belt.

2. A machine of the kind described comprising an endless belt, a series of guide-plates held longitudinally to the belt and spaced apart so as to hold matches in parallel relation on the belt, an inclined discharge-chute arranged to receive the matches from the belt, said chute having guide-plates registering with and forming continuations of the guide-plates of the belt, and a match-box-carrying means movable beneath the free end of the chute.

3. A machine of the kind described comprising an endless belt, a series of guide-plates held longitudinally to the belt and spaced apart so as to hold matches in parallel relation on the belt, an inclined discharge-chute arranged to receive the matches from the belt, said chute having guide-plates registering with and forming continuations of the guide-plates of the belt, a carrying means movable beneath the free end of the chute, and mechanism for tilting the carrying means transversely of its plane of motion.

4. A machine of the kind described comprising an endless belt, a series of guide-plates held in close relation to the upper member of the belt and spaced apart so as to hold matches in parallel relation between them, an inclined chute to receive the matches discharged from the belt, a box-carrying belt movable beneath the discharge end of the chute, and a tilting support for the upper member of the box-carrying belt, said support being adapted to shift the inclination of the carrying-belt transversely to its plane of motion.

5. In a machine of the kind described, the combination with the frame-holding means, of the frames, means for feeding the frames, the reciprocating plunger having pins to enter the frames and eject the matches therefrom, and mechanism for adjusting the feed of the frames by which the frames may be moved at a stroke so as to make the matches to be ejected register with the right number of pins on the plunger.

6. In a machine of the kind described, the combination with the inclined chute, of the belt running at right angles to the chute and adapted to receive the discharge therefrom, and means for tilting the upper member of the belt transversely to its plane of motion.

7. In a machine of the kind described, the combination with the match-discharging chute, of a carrying means movable beneath the discharge end of the chute, and mechanism for tilting said carrying means transversely so as to adjust its horizontal plane with relation to the inclination of the chute.

8. In a machine of the kind described, the combination with the match-discharging chute, of a belt movable beneath the discharge end of the chute, and a tilting plate held beneath the upper member of the belt so as to sustain the said member and hold it at the right inclination with respect to the chute.

9. In a machine of the kind described, the combination with the match-discharging chute, of the belt or carrier movable below the discharge end of the chute and at essentially right angles thereto, an adjustable plate arranged beneath the upper member of the belt or carrier by which the said belt or carrier can be held at the desired inclination with respect to the chute, and a top plate extending over the carrier, said top plate being adjustable in relation to the said belt or carrier.

10. In a machine of the kind described, the combination with the match-discharging chute, of a belt or carrier movable beneath the discharge end of the chute and at essentially right angles to the chute, a back plate near one edge of the carrier, said back plate rising opposite the discharge end of the chute, a guide-plate hinged to the back plate and extending beneath the upper member of the belt or carrier, and a top plate also hinged to the back plate and extending over the said belt or carrier.

11. In a machine of the kind described, the combination with the match-discharging chute, of the belt or carrier movable below the discharge end of the chute and at essentially right angles thereto, a stationary back plate opposite the front edge of the belt or carrier, a guide-plate hinged to the back plate and extending beneath the upper member of the belt or carrier, a top plate hinged to the back plate and extending over the belt or carrier, and means for adjusting the guide-plate and the top plate.

709,268. ALLOY. DANIEL P. JAMES, Bayside, Ill. Filed Mar. 24, 1902. Serial No. 99,200. (No specimens.)

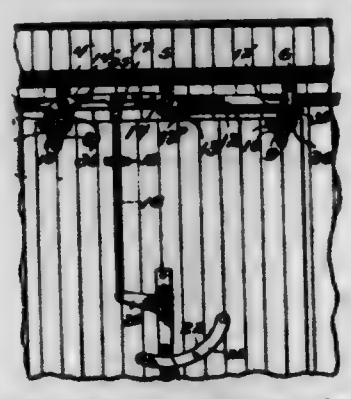
Claim.—An alloy for the uses and purposes set forth consisting of copper, black-tin, nickel, silver and aluminium substantially as described.

709,269. CAR-DOOR. SHERMAN J. JOHNSON, Hatley, N. J. Filed May 7, 1901. Serial No. 59,155. (No model.)

Claim.—1. The combination with a car-body having a doorway and a door, of a track secured to said car-body above the doorway; hanger mechanism mounted on said track; means connecting the door with the hanger mechanism; a swinging actuator pivoted at its upper end to the door and connected with said connecting means and shiftable in the plane of the door, the major part of the mechanism being located above and free of the door.

2. The combination with a car-body having a doorway and a door,

of a track secured to said body above the door, hangers shiftably mounted on said track; means connecting the door with each hanger to control its lateral movement into an upward and outward one and integral to cause the same movement of the door with reference to each hanger; a lever connected to said means and operating in a plane parallel to the side of the car; and an actuator also operating parallel to the side of the car and connected to said lever through means operating only parallel to the side of the car.



3. The combination with a car-body having a doorway and a door, of a track secured to said car-body; a set of hangers mounted on said track; rock-shaft mechanism connecting one side of said door with a pair of said hangers; crank mechanism connecting the other side of said door with another of said hangers; and actuating means connected with said mechanisms for shifting the door upwardly and outwardly.

4. The combination with a car-body having a doorway and a door, of a track secured to said body above the doorway; a plurality of hangers mounted on said track; rock-shaft mechanism connecting a pair of said hangers with the door; crank mechanism connecting another of said hangers with the door; variable-motion means connected with said mechanisms; and actuating means connected with said variable-motion means and effective to shift the door upwardly and outwardly into position to be moved away from the doorway.

5. The combination with a car-body having a doorway and a door, of means supporting said door on said body for movement upwardly and outwardly; an actuator; means coöperating with the bottom of the door; and a stop or stops carried free of the door for limiting the upward movement of the door and effective to prevent the disengagement of the bottom of the door from its coöperating means.

6. The combination with a car-body having a doorway and a door, of means for supporting said door on said body for upward and outward movement; an actuator connected with said supporting means; means coöperating with the bottom of the door; and a stop or stops carried free of the door and effective at one period to prevent the disengagement of said door from its bottom coöperating means and at another period to permit such disengagement.

7. The combination with a car-body having a doorway and a door, of means for supporting said door on said body for upward movement; and shiftable means for limiting the upward movement of the door.

8. The combination with a car-body having a doorway and a door, of means for supporting said door on said body for upward movement; and shiftable means having a plurality of door-limiting positions.

9. The combination with a car-body having a doorway and a door, of means for supporting said door on said body for upward movement; means coöperating with the bottom of the door; and shiftable means having a plurality of door-limiting positions, said means effective in one position to prevent the disengagement of the bottom of the door from its coöperating means and in another position to permit such disengagement while still limiting the upward movement of the door.

10. The combination with a car-body having a doorway and a door, of means for supporting said door on said body for movement upwardly and outwardly; actuating means; a shiftable stop or stops for limiting the upward movement of the door; and brackets coöperating with the bottom of said door, said stop or stops being effective in one position to prevent the disengagement of the door from the brackets and in another position to permit such disengagement.

11. The combination with a car-body having a doorway and a door, of a track secured to said body above said doorway; hanger mechanism mounted on said track; supporting means connecting said hanger mechanism with said door; an actuator effective to shift the door upwardly and outwardly; and shiftable means connected with said hanger mechanism for limiting the upward movement of the door.

12. The combination with a car-body having a doorway and a door, of a track secured to said body above the doorway; hanger mechanism mounted on said track; supporting means connecting said hanger mechanism with said door; an actuator effective to shift the door upwardly and outwardly; a shiftable stop connected with said hanger mechanism for limiting the upward movement of the door; and means coöperating with the bottom of the door, said stop being effective in one position to prevent the disengagement of the bottom of the door from said coöperating means and in another position to permit such disengagement.

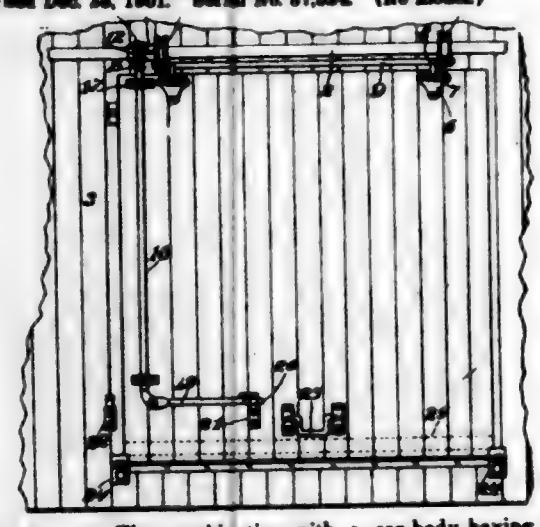
13. The combination with a car-body having a doorway and a door, of a track secured to said body above said doorway; hanger mechanism mounted on said track; supporting means connecting said hanger mechanism with said door and embodying rock-shaft mechanism; an actuator effective to shift the door upwardly and outwardly; brackets coöperating with the bottom of the door; and a shiftable stop or stops located above the door for limiting the upward movement of said door.

14. The combination with a car-body having a doorway and a door, of a track secured to said body above said doorway; hanger mechanism mounted on said track; supporting means connecting said hanger mechanism with said door and embodying rock-shaft mechanism; an actuator effective to shift the door upwardly and outwardly; brackets supporting the bottom of the door; and a shiftable stop or stops located above the door and having a plurality of door-limiting positions.

15. The combination with a car-body having a doorway and a door, of a track secured to said body above said doorway; hanger mechanism shiftable thereon; rock-shaft mechanism connecting said hanger mechanism with the door; a swinging actuator located adjacent to one end of said rock-shaft mechanism and pivoted at its upper end to the door and shiftable in the plane thereof and effective to shift the door upwardly and outwardly; and a lever pivoted to said hanger mechanism adjacent to and at the outer side of said track and connected with said actuator and rock-shaft mechanism.

709,270. CAR-DOOR. SINCLAIR J. JOHNSON, Montclair, N. J.

Filed Dec. 23, 1901. Serial No. 87,394. (No model.)



Claim.—1. The combination with a car-body having a doorway and a door, of a track secured to said body above the door; hangers shiftably mounted on said track; a shaft having a crank connection with one of the hangers and a pivotal bearing adjacent to its lower end; means carried by the door and against which the shaft has a cam-bearing in the motion imparted by the crank operating to shift the door toward and from its jamb; and integral means operating to cause the movement given to the door to be applied at both ends to shift the door outward and upward.

2. The combination with a car-body having a doorway and a door, of a track secured to said body above the door; hanger mechanism shiftably mounted on the track; a shaft having crank connection with said hanger mechanism and a pivotal bearing adjacent to its lower end; means carried by the door and against which the shaft has a cam-bearing in the motion imparted by the crank operating to shift the door toward and away from its jamb; and integral means operating to cause the movement given to the door to be applied at both ends to shift the door outward and upward.

3. The combination with a car-body having a doorway and a door, of a track secured to said body above the door; hanger mechanism shiftably mounted on the track; a jointed shaft having a crank connection with said hanger mechanism and a pivotal bearing adjacent to its lower end; means carried by the door and against which the shaft has a cam-bearing in the motion imparted by the crank operating to shift the door toward and from its jamb; and integral means operating to cause the movement given the door to apply at both ends to shift the door outward and upward.

4. The combination with a car-body having a doorway and a door, of a track secured to said body above the door; hanger mechanism shiftably mounted on the track; a shaft having a crank connected with a part movable on said track with the hanger mechanism and a pivotal bearing adjacent to its lower end; means carried by the door and against which

the shaft has a cam-bearing in the motion imparted by the crank operating to shift the door toward and from its jamb; and integral means operating to cause the movement given the door to be applied at both ends to shift the door outward and upward.

5. The combination with a car-body having a doorway, of a door therefor; two independent mechanisms located and operative in directions transverse to each other and free of linkage connection, one a mechanism connecting the door with the car-body adjacent to each end of such door for simultaneous movement of both ends outward and upward, and the other an actuating mechanism having a cam action relative to the door and effective to move the door outwardly, the organization being such that on the movement of the door outwardly by the actuating means it is moved upward.

6. The combination with a car-body having a doorway, of a door therefor; a pair of rock-shaft mechanisms located and operative in directions transverse to each other and free of linkage connection, one supporting the door adjacent to each end thereof for simultaneous movement of both ends outwardly and upwardly and the other having a cam action relative to the door and effective to move the door outwardly, the organization being such that on the movement of the door outwardly by the actuating means, it is simultaneously moved upward.

7. The combination with a car-body having a doorway, of a door set therein; a track carried by said body; hangers mounted on said track; two independent mechanisms located and operative in directions transverse to each other and free of linkage connection, one connecting the door adjacent to each end thereof with said hangers for simultaneous movement of both ends outwardly and upwardly and the other supported on one of said hangers and having a cam action relative to the door operative by power applied in a direction transverse to the plane of the door, thereby to shift the door outwardly from its seat; the organization being such that on the movement of the door outwardly it is simultaneously moved upward, and without the exertion of power in the direction of the plane of the door.

8. The combination with a car-body having a doorway of a door therefor; a track supported on said body; means shiftable on said track; means connecting the door with said shiftable means for movement outwardly and upward; a rock-shaft actuator secured to the door and having during its rocking movement an appreciable bodily movement relatively to the door, thereby to move such door outwardly, the organization being such that during its outward movement the door is moved upward.

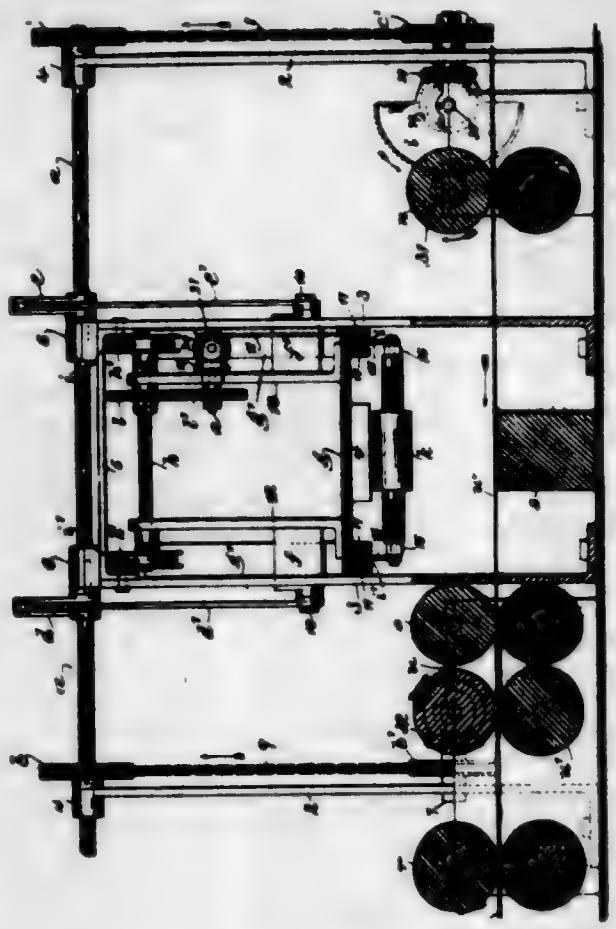
9. The combination with a car-body having a doorway and a door fitting flush therein, of a track secured to said body above the door; hangers shiftably mounted on said track; a jointed shaft having a crank connection with one of the hangers, and a pivotal bearing adjacent to its lower end; a slotted keeper secured to the door and through which said shaft extends and against which the shaft has a cam-bearing in the motion imparted by the crank operating to shift the door toward and from its jamb; and an integral shaft operative to cause the movement given the door to be applied at both ends to shift the door outwardly and upward.

709,271. **MACHINE FOR FEEDING, PRINTING, AND CUTTING STRIPS OF MATERIAL.** SAMUEL KOPS, New York, N. Y., assignor to Kops Brothers, New York, N. Y. Filed Jan. 20, 1902. Serial No. 91,035. (No model.)

Claim.—1. In a machine for feeding, printing and cutting strips of material, the combination with a power-shaft, of printing devices and means for vertically moving the same and for actuating the same by said shaft, cutting devices and means for actuating the same by said shaft, devices for feeding along the strip of material and interchangeable gears and a suitable shaft therefor operated by said power-shaft for actuating the said feeding devices to a predetermined extent so as to regulate the cut lengths of the printed strips, substantially as set forth.

2. In a machine for feeding, printing and cutting strips of material, the combination with a power-shaft, of printing devices, means for actuating the same and connections therefrom to the power-shaft for imparting a vertical upward-and-downward movement to the printing devices, cutting devices and connections therefrom to said power-shaft whereby said cutting devices and said printing devices are positively actuated and a fixed relation maintained between the parts, devices for receiving and for feeding along a strip of material to be cut and printed, and gears interchangeable with one another actuated by said power-shaft for putting the feeding mechanism in motion whereby predetermined lengths of material may be fed and printed so as to provide different lengths of printed strips, substantially as set forth.

3. In a machine for feeding, printing and cutting strips, the combination with a power-shaft, means actuated thereby for severing the strips and other means actuated thereby for feeding said strips, of a platform carrying the type-form, and means connected therewith and to the power-shaft for imparting thereto a vertical downward-and-upward movement, an inking-roller, endless chains, connections from the ends of the inking-roller to the chains, and means substantially as shown and described and actuated by a fixed device through the medium of the vertical movement of the said platform for imparting to said chains and inking-roller a forward-and-backward movement, substantially as set forth.



4. In a machine for feeding, printing and cutting strips, the combination with a power-shaft, means actuated thereby for severing the strips and other means actuated thereby for feeding said strips, of a platform carrying the type-form, and means connected therewith and to the power-shaft for imparting thereto a vertical downward-and-upward movement, an inking-roller, endless chains, connections from the ends of the inking-roller to the chains, a shaft and sprocket-wheels carried by said platform, a gear on said shaft, a second gear meshing therewith, a rack fixed on the frame of the machine, a pinion engaging the same and bevel-wheels actuated by the pinion for imparting movement to the gears, shaft, sprockets and chain with the up-and-down movement of the platform, substantially as set forth.

5. In a machine for feeding, printing and cutting strips of material into lengths, the combination with a power-shaft, printing devices and connections therefrom to the shaft for vertically moving said printing devices and printing the strip, and means actuated by said power-shaft for cutting the strip into lengths, of a series of feeding-rollers in pairs between which the strip is passed, means for connecting said series of rollers to cause them to move together, a shaft and connections therefrom to said power-shaft, a segment-gear mounted on said shaft and interchangeable with similar gears, and a pinion actuated thereby for effecting the movement of the feeding-rollers and the devices connecting the same, substantially as set forth.

6. In a machine for feeding, printing and cutting strips into lengths, the combination with a power-shaft, vertically-movable printing devices actuated by said power-shaft for printing upon the strip, cutting devices also directly actuated by the power-shaft for severing the material into lengths and feeding devices for progressively moving the strip along, of a segment-gear interchangeable with similar gears and so timed with the cutting and printing mechanism that the strip is fed and cut while the gear is operated and printed at a point intermediate of the rest period of the feeding mechanism during the revolution of said segment-gear, substantially as set forth.

7. In a machine for printing, feeding and cutting strips of material, the combination with a power-shaft, of printing devices, means for actuating the same with a vertical movement, cutting devices, means for actuating said cutting devices by said shaft, devices for feeding along a strip of material, interchangeable segmental gear-wheels and a suitable shaft for said gear-wheels operated by said power-shaft for actuating the said feeding devices to a predetermined extent so as to regulate the cut lengths of the printed strips, substantially as set forth.

8. In a machine for feeding, printing and cutting strips of material, the combination of feeding-rolls for moving the strip along, a cutter for cutting off the strip at predetermined lengths, a type form or block for printing upon the strip of material, and means for raising and lowering and actuating said parts so that after a strip is cut off the next strip is moved forward and stopped the necessary distance for the type form or block to be brought down to print upon the exact center of the length of the strip, and then after the block is raised, the strip is moved forward exactly one-half of the length of the predetermined strip and is then cut off, substantially as specified.

9. In a machine for feeding, printing and cutting strips of material, the combination with a power-shaft, printing devices, means for actuating the same by the power-shaft, feeding devices and means for actuating said feeding devices from the power-shaft, of a rotary cutter, suitable shaft and bearings therefor, a cylindrical cutter-block, a shaft, a sprocket and bevel-gear on said shaft, a chain connecting said sprocket with the power-shaft, and a bevel-gear on the rotary-cutter shaft and meshing with the aforesaid gear whereby the rotary cutter is actuated by the power-shaft, substantially as specified.

10. In a printing-machine, the combination with a frame and a power-shaft, of a platform adapted to hold the type-forms, standards secured to the said platform, blocks connected to the said standards and received in vertical slots in said frame, connections between said blocks and power-shaft whereby a vertical up-and-down movement may be imparted to said standards and platform, inking-rollers and means for actuating the same by the up-and-down movement of the platform and standards, substantially as set forth.

11. In a printing-machine, the combination with a frame and a power-shaft, of a platform adapted to hold the type-form, devices secured to and extending under both sides of the said platform and having internal grooved ways, standards secured to the said platform, blocks connected to the said standards and received in vertical slots in said frame, connections between said blocks and power-shaft whereby a vertical up-and-down movement may be imparted to said standards and platform, a shaft secured in the upper end of said standards, rollers on the said shaft, other rollers secured to the said platform, endless chains passing over said rollers and within said internal grooved ways, inking-rollers secured to said chains, and means for actuating said inking-rollers by the up-and-down movement of the platform and standards to operate the said inking-rollers, substantially as specified.

12. In a printing-machine, the combination with a frame and a power-shaft, of a platform adapted to hold the type-form, devices secured to and extending under both sides of the said platform and having internal grooved ways, standards secured to the said platform, blocks connected to the said standards and received in vertical slots in said frame, connections between said blocks and power-shaft whereby a vertical up-and-down movement may be imparted to said standards and platform, a shaft secured in the upper end of said standards, rollers on the said shaft, other rollers secured to the said platform, endless chains passing over said rollers and within said internal grooved ways, inking-rollers secured to said chains, a gear-wheel on said shaft, a short shaft secured in one of said standards, a gear-wheel on said short shaft and meshing with the aforesaid gear-wheel, a rack secured to said frame, a pinion meshing with said rack, a shaft for said pinion, and connections between the pinion, shaft and said short shaft, whereby with the up-and-down movement of the platform and standards the said chain is actuated to impart a back-and-forward movement to the said inking-rollers, substantially as set forth.

709,272. STAMP-AFFIXER. HENRY D. LOSE and JAMES JACKSON, Philadelphia, Pa. Filed June 27, 1902. Serial No. 113,406. (No model.)

Claim.—1. In a stamp-affixer, a head having an elastic pad thereon and a box adapted to receive said head and pad and being provided with inturned lips on its lower end, said pad being in frictional contact with said box.

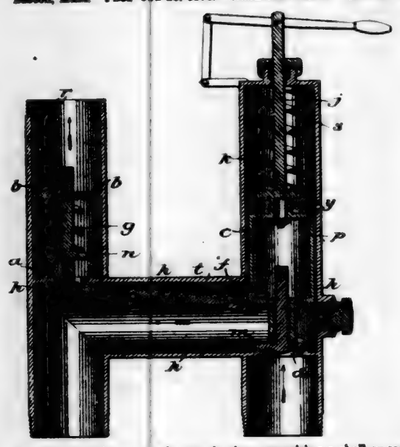
2. In a stamp-affixer, a head having an elastic pad thereon, and a box adapted to receive said head and pad, said pad being in frictional contact with said box and adapted to retain said head and box in connection.

3. In a stamp-affixer, a hollow head having inturned tongues and a pad of elastic material having grooves in its sides adapted to receive said tongues forming interlocking joints connecting said pad with said head.

4. In a stamp-affixer, a hollow head, a handle at the upper end thereof, an elastic pad connected with the lower end thereof, said head and pad being connected by an interlocking joint and a box having inturned lips on its lower end.

5. In a stamp-affixer, a hollow head, a handle at the upper end thereof, an elastic pad connected with the lower end thereof, said head and pad being connected by an interlocking joint and a box having inturned lips on certain sides of its lower end.

709,273. VALVE FOR PUMPS, &c. THOMAS A. MACDONALD, Boston, Mass. Filed Oct. 20, 1898. Serial No. 694,148. (No model.)



Claim.—1. A pump-valve mechanism comprising a shell or casing having an inlet or suction pipe, a chamber having a side aperture, a hollow piston or slide valve movable in said chamber, a suction-pipe valve adapted to be held to its seat by said piston, and means for moving the piston to open the valve and close the side aperture in the casing.

2. A pump-valve mechanism comprising a shell or casing having an inlet or suction pipe, a chamber opposite said inlet and having a side aperture, a hollow piston movable in said chamber and having an air inlet and outlet, a check-valve being provided for the inlet, a suction-pipe valve connected to the said piston and adapted to be held to its seat by said piston, and means for moving the piston to release the valve and to simultaneously close the side aperture in the casing and the air-outlet from said piston.

3. A valve mechanism for pumps comprising a shell or casing having suction and discharge connections *w r*, and a pump connection *o* and a chamber *k* opposite the suction connection, a piston-valve *p* in said chamber, a valve *m* guided by said piston, means for moving said piston in the chamber *k*, and means controlled by said piston for admitting air to the valve-shell below said piston.

4. A valve mechanism for pumps comprising a shell or casing having suction and discharge pipes, valves *w* and *n* for said pipes respectively, and means including a lever for causing the simultaneous alternate movements of said valves, a movable piston to which the valve *w* is connected, said piston bearing on one end of the lever, and a spring bearing on the valve *n*.

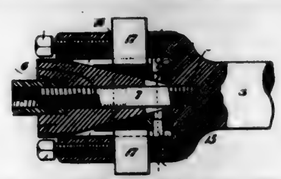
709,274. WITHDRAWN.

709,275. BORING-BAR. WILLIAM A. HEYLOR, Allegheny, and JOHN GOULDSBARRY, McKees Rocks, Pa. Filed Oct. 19, 1901. Serial No. 79,234. (No model.)

Claim.—1. A boring-bar provided with lateral recesses, cutters mounted therein, a central tapered expanding-block provided with longitudinal ways, wedges mounted in the ways and adapted to bear against the cutters, means for adjusting the block and means for securing the cutters.

2. A boring-bar provided with lateral recesses, cutters mounted therein, a central rigid bar provided with adjusting means on its outer end, an expanding-block mounted on the bar provided with tapered ways, and wedges mounted in the ways adapted to bear against the cutters.

3. A boring-bar provided with lateral recesses, cutters mounted therein, a central rigid bar provided with adjusting means on its outer end, an expanding-block mounted on the bar provided with tapered ways, wedges therein, and means for preventing longitudinal movement of the wedges.

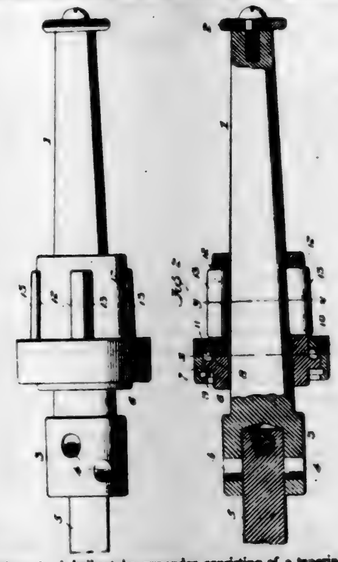


4. A boring-bar provided with lateral recesses, cutters mounted therein, a central rigid bar provided with adjusting means on its outer end, an expanding-block mounted on the bar provided with tapered ways, wedges therein, means for securing the cutters, and means for preventing longitudinal movement of the wedges.

5. In a boring-bar, the combination of a bar provided with a cylindrical head having a cylindrical longitudinal cavity, lateral recesses extending through the sides of the head, cutters mounted therein, set-screws mounted in the head adapted to bear on the cutters, a smooth central longitudinal stem rigidly secured in the head and threaded at its outer end, a cylindrical expanding-block slidingly mounted on the stem, having a bearing for its full length in the longitudinal cavity and provided with longitudinal tapered ways, an adjusting-nut on the outer threaded end of the stem rotatably inserted in the end of the block provided with an annular groove, and securing-pins mounted in the block and extending into said groove, substantially as set forth.

6. In a boring-bar, the combination of a bar provided with a cylindrical head having a cylindrical longitudinal cavity, lateral recesses extending through the sides of the head, pairs of cutters mounted in the recesses, one of each pairs being in advance of the other, set-screws mounted in the head adapted to bear on the cutters, a smooth central longitudinal stem rigidly secured in the head and threaded at its outer end, a cylindrical expanding-block slidingly mounted on the stem, having a bearing for its full length in the longitudinal cavity and provided with longitudinal tapered ways, an adjusting-nut on the outer threaded end of the stem, rotatably inserted in the end of the block, provided with an annular groove, and securing-pins mounted in the block and extending into said groove, substantially as set forth.

709,276. BOILER-TUBE EXPANDER. FREDERICK PALFREY, Macon, Mo. Filed Jan. 2, 1902. Serial No. 88,097. (No model.)



Claim.—1. A boiler-tube expander consisting of a tapering mandrel equipped and mounted with the parts as hereinbefore described, the body with its ball-bearing shoulder mounted on the mandrel, the five expanding-rollers in the body, the sleeve with its ball-bearing collar mounted on the body; the antifriction ball-bearings placed between sleeve-collar and body-shoulder; and the spring-ring inserted in the groove of the sleeve when placed in position on the body.

2. In a tube-expander, the combination of a mandrel, a sleeve fitting on said mandrel and carrying a series of expanding-rollers, a shoulder formed on said sleeve and having a ball channel or way, a collar fitting on said shoulder and having an overlapping portion formed with a ball channel or way, a series of balls in said ball track or channel, and means for holding the collar on the shouldered portion of the sleeve.

3. A tube-expander, consisting of a mandrel having a cap and screw at one end and having a hollow head at the other end, a sleeve on said mandrel carrying a series of expanding-rollers, a shoulder on said sleeve having a ball-channel, a collar fitting said shoulder having a ball-channel coincident with the channel of the shoulder and also having a groove, balls fitting in the way or channel of the collar and shoulder, and a spring in the groove of the collar to secure the collar.

709,277. TREATMENT OF NICKEL AND COPPER-NICKEL ORES. CAMILLO PERSON, Rome, Italy. Filed June 25, 1902. Serial No. 113,076. (No specimens.)

Claim.—1. A process of lixiviation of poor copper-nickel ores, which consists in the treatment of the said ores in crude or natural condition with sulfid of ammonium.

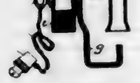
2. A process of lixiviation of copper-nickel ores which consists in the treatment of the said ores with sulfid of ammonium containing free ammonia.

3. A process of lixiviation of copper-nickel ores which consists in the treatment of the said ores with sulfids of the metals of the alkalies.

4. A process of lixiviation of copper-nickel ores which consists in the treatment of the said ores with sulfids of the metals of the alkalies containing free ammonia.

5. A process of extracting nickel from its ores which consists in treating nickel ore with a solution of the sulfids of the metals of the alkalies, stirring the same, collecting the liquid, washing the residue with cold water, and reducing the metallic nickel by means of hydrogen sulfid.

709,278. BURNER ATTACHMENT. THOMAS I. ROY and THOMAS MARSHALL, Jr., Chicago, Ill. Filed July 24, 1901. Serial No. 69,536. (No model.)



Claim.—1. The combination with a tube provided with a perforation in its wall to afford communication with its bore, of a ring surrounding the portion of the tube where the said perforation is located, and a burner-tube secured to the ring, the bore of the said tube continuing through the ring and adapted to be brought into and out of communication with the said perforation by the rotation of the said ring, substantially as described.

2. The combination with a tube provided with a perforation in its wall to afford communication with its bore, of a ring surrounding the portion of the tube where the said perforation is located, a burner-tube secured to the ring, the bore of the said tube continuing through the ring and adapted to be brought into and out of communication with the said perforation by the rotation of the said ring, and an added section of burner-tube located above the main tubular section to secure the thorough mixture of air and gas, substantially as described.

3. The combination with a tube provided with a perforation in its wall to afford communication with its bore, of a ring surrounding the portion of the tube where the said perforation is located, a burner-tube secured to the ring, the bore of the said tube continuing through the ring and adapted to be brought into and out of communication with the said perforation by the rotation of the said ring, and a support for the tool to be heated extending above the burner-tube, substantially as described.

4. The combination with a tube provided with a perforation in its wall to afford communication with its bore, of a ring surrounding the portion of the tube where the said perforation is located, a burner-tube secured to the ring, the bore of the said tube continuing through the ring and adapted to be brought into and out of communication with the said perforation by the rotation of the said ring, an added section of burner-

tube located above the main tubular section to secure the thorough mixture of air and gas, and a support for the tool to be heated extending above the supplemental-burner tube, substantially as described.

5. The combination with a tube provided with a perforation in its wall to afford communication with its bore, of a ring surrounding the portion of the tube where the said perforation is located, a burner-tube secured to the ring, the bore of the said tube continuing through the ring and adapted to be brought into and out of communication with the said perforation by the rotation of the said ring, and a support for the tool to be heated extending above the burner-tube, the said support being secured to the aforesaid ring, substantially as described.

6. The combination with a tube provided with a perforation in its wall to afford communication with its bore, of a ring surrounding the portion of the tube where the said perforation is located, a burner-tube secured to the ring, the bore of the said tube continuing through the ring and adapted to be brought into and out of communication with the said perforation by the rotation of the said ring, an added section of burner-tube located above the main-burner tube to secure the thorough mixture of air and gas, and a support for the tool to be heated extending above the burner-tube, the said support being secured to the aforesaid ring, substantially as described.

7. The combination with a main-burner tube provided with a removable burner-tip, of a supplemental-burner tube, a ring to which the latter tube is secured and with the bore of which the latter tube has communication, the main-burner tube being provided with a perforation adapted to be brought into and out of communication with the supplemental-burner tube upon the rotation of the said ring, and means for stopping the outlet of the main-burner tube when the supplemental-burner tube is to be brought into service, substantially as described.

8. The combination with a main-burner tube provided with a removable burner-tip, of a supplemental-burner tube, a ring to which the latter tube is secured and with the bore of which the latter tube has communication, the main-burner tube being provided with a perforation adapted to be brought into and out of communication with the supplemental-burner tube upon the rotation of the said ring, means for stopping the outlet of the main-burner tube when the supplemental-burner tube is to be brought into service, and a support for the tool to be heated extending above the supplemental-burner tube, substantially as described.

9. The combination with a tube provided with a perforation in its wall to afford communication with its bore, of a ring surrounding the portion of the tube where the said perforation is located, and a burner-tube secured to the ring, the bore of the latter tube continuing through the ring and adapted to be brought into and out of communication with the said perforation by the rotation of the said ring, the said ring being composed of soft metal to thoroughly seal the perforation, substantially as described.

10. The combination with a main-burner tube, of a supplemental-burner tube in communication with the bore of the main-burner tube through the side thereof, and a slip-support for the supplemental-burner tube, serving to support the supplemental tube away from the main-burner tube, whereby both burners may be lighted simultaneously, substantially as described.

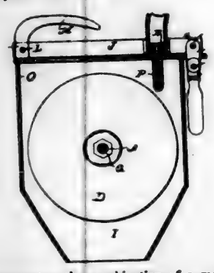
11. The combination with a main-burner tube, of a supplemental-burner tube in communication with the bore of the main-burner tube through the side thereof, a slip-support for the supplemental-burner tube serving to support the supplemental tube away from the main-burner tube, whereby both burners may be lighted simultaneously, and an added section of the supplemental-burner tube separated from the main section of the supplemental tube to secure an intermixture of air and gas, substantially as described.

12. The combination with a main burner tube, of a supplemental-burner tube adapted for communication therewith, and a support including a slip-ring by which the supplemental-burner tube is supported upon the main-burner tube and away therefrom, whereby both burners may be lighted simultaneously, substantially as described.

709,279. WATER-MOTOR. EMELIUS SCHMIDT, Milwaukee, Wis. Filed Dec. 24, 1901. Serial No. 87,072. (No model.)

Claim.—1. In a water-motor, the combination of a motor-case; a shaft supported from the walls of said case; a motor-wheel having two separate sets of buckets, comprising a central plate or disk; two flanged disks located upon the sides of said central disk; two additional disks located upon the sides of said flanged disks in such a manner that a set of buckets is formed upon each side of said central disk between it and said side disks; means for clamping all of said disks together upon each set of buckets of said wheel, as set forth.

2. In a water-motor, the combination of a motor-case; a motor-wheel having two separate sets of buckets supported on a shaft from the opposing walls of said case; two water-discharge nozzles supported from said motor-case, each adapted to project a separate jet of water upon the respective set of buckets of the wheel; a single elastic packing inclosing the protruding ends of said discharge-nozzles and adapted to impinge against the inner walls of a faucet; means for clamping said case to a faucet; and means for forcing said packing up into the mouth of the faucet, to which it is clamped, as set forth.



3. In a water-motor, the combination of a motor-case; a motor-wheel having two separate sets of buckets supported on a shaft from the opposing walls of said case; two water-discharge nozzles supported from said motor-case, each adapted to project a separate jet of water upon the respective set of buckets of the wheel; a single elastic packing inclosing the protruding ends of said discharge-nozzles, and adapted to impinge against the inner walls of a faucet; two parallel clamping-plates, pivotally connected at one end to the rear side of the motor-case, and adapted to engage at their front ends around the lower end of the faucet; a clamping-bolt extending through apertures formed in the front ends of said clamping-plates; a nut operating on said clamping-bolt, and adapted, as it is turned down thereon, to draw said clamping-plates together around said faucet; a cam or eccentric lever suspended by flexible connections from said clamping-plates beneath a projection of said motor-case, and adapted, as it is turned in one direction, to impinge against said case projection, whereby said case is drawn upwardly and said packing is forced into the mouth of said faucet, all substantially as set forth.

709,280. PNEUMATIC TIRE. IRVIN THERAFF, Springfield, Ohio. Filed Aug. 11, 1902. Serial No. 119,175. (No model.)

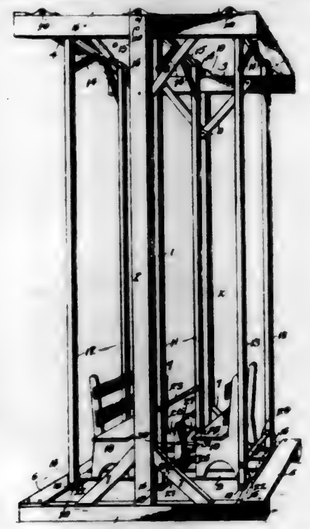
Claim.—1. A pneumatic tire comprising a tubular body having a thickened tread, lateral inwardly-arched diaphragms forming lateral protective chambers, and a central chamber for compressed air, fillings of sponge-rubber located in said lateral protective chambers, and a metallic protective strip located in the tread and of a width greater than the exposed portion of the central air-chamber, substantially as described.

2. A pneumatic tire comprising a tubular body having a thickened tread, lateral inwardly-arched diaphragms forming lateral protective chambers of elongated shape in cross-section, their longer axes converging outwardly, and a central chamber for compressed air, fillings of sponge-rubber located in said lateral protective chambers, and a metallic protective strip located in the tread and of a width greater than the exposed portion of the central air-chamber, substantially as described.

3. A pneumatic tire comprising a tubular body having a thickened tread, a tubular fabric inward of the same, and lateral bodies of sponge-rubber elongated in cross-section and with their longer axes inclined outwardly toward each other, fabric walls inclosing said sponge-rubber bodies and united with each other at the tread of the tire, a metallic protective strip located in the tread of the tire between the outer and inner layers of fabric and having a width greater than the exposed portion of the air-chamber, bodies of rubber located between the inner and outer layers of fabric inwardly from the edges of the metallic protective strip, and an inner air-tube of rubber, all united by vulcanization, substantially as described.

709,281. SWING. WILLIAM C. TUTTLE, Adrian, Mo., assignor of one-half to Reuben Bryant and Sanford A. McDaniel, Adrian, Mo. Filed Oct. 4, 1901. Serial No. 77,507. (No model.)

Claim.—1. A swing comprising a frame, a platform, swing-bars supporting the platform and arranged at the center and ends thereof, and a transverse handle-bar secured to the central swing-bars and arranged to be grasped by the occupants, substantially as and for the purpose described.



2. A swing comprising a frame, a platform, swing-bars supporting the platform and arranged at the center and ends thereof, seats located at the ends of the platform, and the foot-engaged devices mounted on the central bars near the lower ends thereof and arranged between the seats, substantially as described.

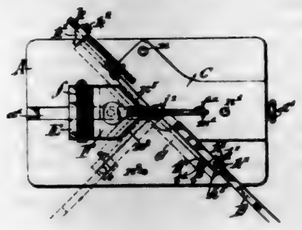
3. A swing comprising a platform, central and end swing-bars, the transverse handle-bar connecting the central swing-bars and arranged to be grasped by the occupants, and the devices mounted on the central swing-bars at points below the handle-bar and arranged to be engaged by the feet of the occupants, substantially as described.

4. A swing comprising a platform, swing-bars supporting the platform, a central standard or post mounted on the platform, an upright lever fulcrumed between its ends on the standard or post and provided at its lower arm with means to be engaged by the feet, and connections between the upper arm of the lever and the swing-bars, substantially as described.

5. A swing comprising a platform, swing-bars supporting the platform, a post or standard mounted on the platform, a forked or bifurcated lever straddling the post or standard and fulcrumed thereon and provided at opposite sides of the bifurcation with devices to be engaged by the feet of the occupants, and means for connecting the levers with the swing-bars, substantially as described.

6. A swing comprising a platform, central swing-bars provided near their lower ends with devices to be engaged by the feet of the occupants, seats located at the opposite sides of the central swing-bars, end swing-bars, and an upright lever mounted on the platform and connected with the end swing-bars and provided with devices to be engaged by the feet of the occupants, substantially as described.

709,282. MACHINE FOR BENDING ANGLE-IRON. WILHELM VOLLMER, Brooklyn, N. Y. Filed May 31, 1902. Serial No. 109,656. (No model.)



Claim.—1. In a machine for bending angle-iron, the combination, with a base or bed, of a guide-block on the same, a forming-block on said bed having two contiguous working surfaces, a bending-lever, an upsetting-abutment on said forming-block parallel with said working surfaces and being offset therefrom, and a presser-plate cooperating with said abutment to form a recess for the horizontal flange of the iron, substantially as set forth.

2. In a machine for bending angle-iron, the combination, with a base or bed, of a guide-block on the same, a forming-block on said bed having two contiguous working surfaces arranged at an angle each to the other, a bending-lever, an upsetting-plate on said forming-block, having faces disposed parallel to said working surfaces and offset some distance therefrom, and a pivoted presser-plate adapted to swing in a vertical plane centrally between said working surfaces and to cooperate with said upsetting plate to form a recess for the horizontal flange of the angle-iron, substantially as set forth.

3. In a machine for bending angle-iron, the combination, with the base or bed, of a guide-block on the same, a forming-block on the bed, a bending-lever, a presser-plate, a gage on the bending-lever for causing the upsetting of the metal simultaneously with the bending of the same, and a removable upsetting-plate on the forming-block, between the same and the presser-plate, said upsetting-plate being cut away at its forward portion in rounded form so as to receive the upset metal of the horizontal flange of the iron, substantially as set forth.

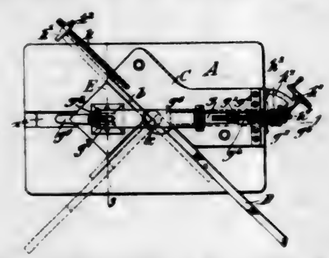
4. In a machine for bending angle-iron, the combination, with a base or bed, of a guide-block on the same, a forming-block on the bed, a bending-lever, interchangeable upsetting-plates for said forming-block, a presser-plate on said forming-block, and an adjustable retaining means on said guide-block for retaining the presser-plate in depressed position, substantially as set forth.

5. In a machine for bending angle-iron, the combination, with a base or bed, of a guide-block on the same, a forming-block having working portions at the edges of two adjacent sides and the top surface, a bending-lever, a presser-plate arranged on said forming-block, an upsetting-plate on said forming-block between the same and said presser-plate, a vertically-adjustable rest on said guide-block, and a longitudinally and laterally adjustable rest carried on said bending-lever, substantially as set forth.

6. In a machine for bending angle-iron, the combination of a bending-lever, a sliding rest carried on the same, said rest being recessed next to the lever-body for receiving the vertical flange of the angle-iron, a vertically-adjustable block secured in said recess, and means for adjusting said rest laterally on the lever for changing the width of said recess, substantially as set forth.

7. In a machine for bending angle-iron, the combination, with the base or bed, of a reversible guide-block on the same, a forming-block on the bed, a reversible top plate on the guide-block, a bending-lever, and means for securing said guide-block, top plate and lever in position on said bed at either side of the forming-block, substantially as set forth.

709,288. MACHINE FOR BENDING FLAT IRON. WILHELM VOLLMER, Brooklyn, N. Y. Filed May 31, 1902. Serial No. 109,659. (No model.)



Claim.—1. In a machine for bending flat iron, the combination of a base or bed, a guide-block on the same, a laterally-movable bending-lever on the base, a forming-block adjustable longitudinally of the base and located at the forward side of the bending-lever, and an adjustable retaining member for said forming-block extending rearwardly from said forming-block and secured at its rear end at the opposite side of the bending-lever, against longitudinal movement, substantially as set forth.

2. In a machine for bending flat iron, the combination of a base or bed, a guide-block on the same, a bending-lever on the base, a forming-block adjustable longitudinally of the base, and two adjustable retaining members for said forming-block connected respectively one with the upper end and one with the lower end of the same, substantially as set forth.

3. In a machine for bending flat iron, the combination of a base or bed, a guide-block on the same, a bending-lever on the base, a forming-block adjustable longitudinally of the base, two adjustable retaining members for said forming-block connected respectively with the upper and lower ends of the same, and means for simultaneously adjusting both of said members, substantially as set forth.

4. In a machine for bending flat iron, the combination of a base or bed, a guide-block on the same, a bending-lever on the base, a forming-block adjustable longitudinally of the base, two adjustable retaining members for said forming-block connected respectively with the upper and lower ends of the same, and means for simultaneously and uniformly adjusting both members, substantially as set forth.

5. In a machine for bending flat iron, the combination of a base or bed, a guide-block on the same, a bending-lever on the base, a forming-block adjustable longitudinally of the base, and two retaining members for said forming-block connected respectively one with the upper end and one with the lower end of the same, substantially as set forth.

6. In a machine for bending flat iron, the combination of a base or bed, a guide-block on the same, a bending-lever on the base, a forming-block adjustable longitudinally of the base, two adjustable retaining members for said forming-block, and a locking device for locking said members together in position, substantially as set forth.

7. In a machine for bending flat iron, the combination of a base or bed, a guide-block on the same, a bending-lever on the base, a forming-block adjustable longitudinally of the base, a stud on the forming-block, a lower retaining member for adjusting said block, and an upper retaining member comprising an adjustable rear portion and a forward portion hinged to said rear portion and adapted to be raised or lowered into engagement with said stud, substantially as set forth.

709,284. MATRIX FOR STEREOTYPING. JOHANN E. WEISS, Vienna, Austria-Hungary. Filed Jan. 27, 1902. Serial No. 91,719. (No specimens.)

Claim.—1. The herein-described process for producing dry matrices for stereotype printing consisting of brushing a sheet of nipple plastic cardboard with a paste of vegetable glue, laying on a gauze-like fabric prepared in mucilage of gelatin and pressing thereover a sheet of unsized paper, the outer side of which unsized paper is coated with mucilage of carrageen-moss and albumen glue and pressing thereon any desired number of sheets of tissue-paper, substantially as and for the purpose set forth.

2. The herein-described process for producing dry matrices for stereotype printing, consisting of brushing a sheet of nipple, plastic cardboard with a paste of vegetable glue, glue of albumen and alcohol, laying on a gauze-like fabric prepared in mucilage of gelatin and pressing thereover a sheet of unsized paper, the outer side of which unsized paper is coated with mucilage of carrageen-moss and albumen glue and pressing thereon any desired number of sheets of tissue-paper, substantially as and for the purpose set forth.

3. The herein-described process for producing dry matrices for stereotype printing, consisting of brushing a sheet of nipple, plastic cardboard with a paste of vegetable glue, glue of albumen and alcohol, to which is added in small quantity glycerin, laying on a gauze-like fabric, prepared in mucilage of gelatin and pressing thereover a sheet of unsized paper, the outer side of which unsized paper is coated with mucilage of carrageen-moss and albumen glue, and pressing thereon any desired number of sheets of tissue-paper, substantially as and for the purpose set forth.

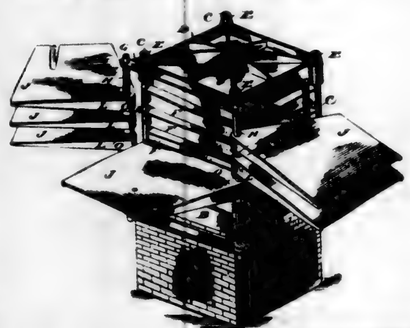
4. The herein-described process for producing dry matrices for stereotype printing, consisting of brushing a sheet of nipple, plastic cardboard with a paste of vegetable glue, glue of albumen and alcohol, to which is added in small quantities glycerin and calcium chlorid, laying on a gauze-like fabric prepared in mucilage of gelatin and pressing thereover a sheet of unsized paper, the outer side of which unsized paper is coated with mucilage of carrageen-moss and albumen glue, and pressing thereon any desired number of sheets of tissue-paper, substantially as and for the purpose set forth.

5. As an article of manufacture a matrix for stereotyping in the dry way, consisting of a sheet of nipple, plastic cardboard coated on one side with vegetable glue, glue of albumen and alcohol, a gauze-like fabric prepared in mucilage of gelatin lying between said pasted plastic cardboard and a sheet of hard unsized paper, on the outer side of which unsized paper any desired number of sheets of tissue-paper adhering by means of a paste of mucilage of carrageen-moss and albumen glue.

6. As an article of manufacture a matrix for stereotyping in the dry way, consisting of a sheet of nipple plastic cardboard coated on one side with vegetable glue, glue of albumen and alcohol, to which is added glycerin in small quantity, a gauze-like fabric prepared in mucilage of gelatin, lying between said pasted plastic cardboard and a sheet of hard unsized paper, on the outer side of which unsized paper any desired number of sheets of tissue-paper adhering by means of a paste of mucilage of carrageen-moss and albumen glue.

7. As an article of manufacture a matrix for stereotyping in the dry way, consisting of a sheet of nipple, plastic cardboard coated on one side with vegetable glue, glue of albumen and alcohol, to which are added in small quantities, a gauze-like fabric prepared in mucilage of gelatin and calcium chlorid lying between said pasted plastic cardboard and a sheet of hard unsized paper, on the outer side of which unsized paper any desired number of sheets of tissue-paper adhering by means of a paste of mucilage of carrageen-moss and albumen glue.

709,285. SWINGING TABLE FOR HYDRAULIC PRESSES. AARON WILKIS and SARAH B. GALLAGHER, (also known as Elizabeth G. Wilkes,) Trenton, N. J., administrators of Moses Wilkes, deceased. Filed May 24, 1902. Serial No. 108,801. (No model.)



Claim.—1. In combination with a vulcanizing-press and vertically-movable platens connected therewith, one or more horizontal tables vibratively connected with the vertical frame of the press and in alinement with the space or spaces between the platens, whereby molds may be delivered from the table or tables, to the action of the platens, or removed from the platens to the table, substantially as hereinbefore set forth.

2. In combination with a press, one or more laterally-swinging and vertically-adjustable tables adapted to support and transport molds to and from the press, substantially as hereinbefore set forth.

3. In combination with a press and the pillars or posts thereof, the links or arms G, brace-bars I, vertical rods H, and adjustable swinging tables J, substantially as and for the purposes set forth.

4. In combination with a press, a series of swinging tables arranged in pairs on opposite sides, each pair adapted to swing in the same horizontal plane, substantially as and for the purposes set forth.

709,286. ROTARY AND FOLDING CHAIR. JOHN A. WILKINSON, New York, N. Y., assignor of one-half to George B. Frost, New York, N. Y. Filed Mar. 13, 1902. Serial No. 97,804. (No model.)

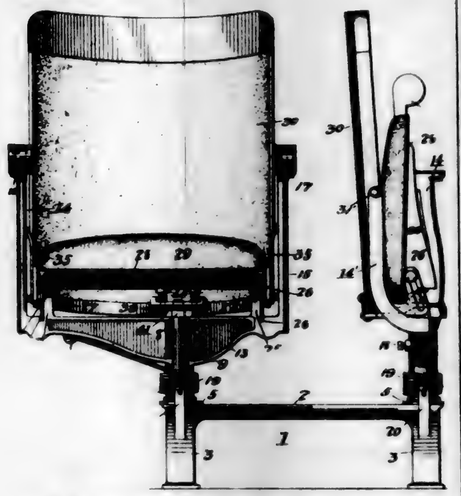
Claim.—1. A foldable, rotary chair, comprising a supporting-base, a rotary stem mounted thereon, a locking-plate movably mounted upon said stem and engaging the base for securing the stem to the base, and a cam connected with a movable part of the chair to release the lock when the chair is moved to open position, substantially as described.

2. A foldable, rotary chair comprising a supporting-base, a rotary stem mounted on said base, an angular head on said base, a locking-plate movably mounted upon said stem and coöperating with said angular head to lock the stem to the base, and means for moving said locking-plate out of engagement with said head, substantially as described.

3. A foldable, rotary chair, comprising a supporting-base having an angular head, a rotary stem mounted on said base, a locking-plate movably mounted upon said stem and coöperating with said angular head to secure the stem to the base, and a cam connected with a movable part of the chair and engaging said locking-plate to disengage the plate from the head when the chair is moved from open position, substantially as described.

4. A foldable, rotary chair, comprising a supporting-base having an angular head, a rotary stem mounted on said base, a spring-pressed locking-plate carried by said stem and provided with an aperture coöperating with said angular head to secure the stem to the base, and a cam-plate connected with a movable part of the chair and located adjacent to said locking-plate, whereby the latter is caused to disengage the head when the chair is moved from open position, substantially as described.

5. A foldable, rotary chair, comprising a supporting-base having an angular head, a rotary stem mounted on said base, a folding seat and back pivoted to said base, connection between the seat and back to operate them simultaneously, a locking-plate movably mounted upon said stem and coöperating with said angular head to secure the stem to the base, a cam for releasing the locking-plate, and a spring connected to the base and the stem to rotate the stem when said plate is released, substantially as described.



6. A foldable, rotary chair, comprising a supporting-base having an angular head, a rotary stem mounted on said base, a folding seat and back pivoted to said base, connection between the seat and back to operate them simultaneously, a locking-plate movably mounted upon said stem and coöperating with said angular head to secure the stem to the base, a cam-plate connected to the back and engaging the locking-plate to release the latter when the chair is moved from open position, and a spring connected to the base and the stem to rotate the stem when said plate is released.

7. A foldable, rotary chair, comprising a supporting-base having an angular headed post mounted thereon, a rotary stem provided with a hollow standard surrounding said post, a pin-and-slot connection between the post and standard to limit the rotation of said standard, a locking-plate movably mounted upon said stem and coöperating with said angular head to secure the stem to the base, and means for moving said locking-plate out of engagement with said head, substantially as described.

8. The combination in a pair of foldable, rotary chairs, of a stationary base, comprising a rectangular pedestal and two angular-headed posts mounted thereon, a rotary stem on each chair provided with a hollow standard engaging the respective posts, automatic means to rotate the chairs one-fourth around into a back-to-back position, a locking-plate movably mounted upon the rotary stem of each chair coöperating with the angular heads on the respective posts to lock the chairs in open position, and means to disengage the plates from the heads when the said chairs are moved from open position, substantially as described.

9. The combination with a stationary base, comprising a pedestal and an angular-headed post mounted on the top thereof, of a foldable rotary chair, having a hollow standard engaging said post, brackets projecting from opposite sides of said standard, coöperating foldable seat and back members pivotally connected with said brackets, a locking-plate mounted upon the upper faces of the brackets and provided with an angular orifice coöperating with the angular head of the supporting-post, and a sliding frame connected with the chair-back and provided with cam edges operating between the bracket-tops and the locking-plate to permit the latter to engage with the post-head when the chair is open and to break the engagement between the plate and the head when the chair is moved from open position; substantially as described.

10. The combination with a stationary base, comprising a pedestal and an angular-headed post mounted on the top thereof, of a foldable rotary chair, having a hollow standard engaging said post, brackets projecting from opposite sides of said standard, coöperating foldable seat and back members pivotally connected with said brackets, a locking-plate mounted upon the upper faces of the brackets and provided with an angular orifice coöperating with the angular head of the supporting-post, a sliding frame connected with the chair-back and provided with cam edges operating between the bracket-tops and the locking-plate to lift the latter and unlock the chair when the chair is opened, and a spring connected to the chair and to the pedestal to rotate said chair one-fourth around when the lock is released; substantially as described.

11. The combination with a stationary base, comprising a pedestal having a post-receiving socket, a post having an angular head and flanged base provided with a base engaging said socket, of a foldable, rotary chair having a hollow standard mounted upon said post, brackets projecting from opposite sides of said standard, coöperating foldable seat, back and arm members, pivotally connected with said brackets, a locking-plate provided with an angular orifice coöperating with the angular head of the supporting-post, pins supported in the tops of said brackets and guiding said locking-plate, a sliding frame provided with cam edges operating between the tops of the brackets and the locking-plates to lift the latter and unlock the chair when the chair is opened, and a spiral spring surrounding the standard and connected to the pedestal and the brackets and serving to rotate the chairs one-fourth around when the lock is released; substantially as described.

709,287. GEARING. HARRY L. WRIGHT, Chicago, Ill., assignor of one-half to George H. Cropsey, Chicago, Ill. Filed July 24, 1901. Serial No. 68,802. (No model.)

Claim.—1. In an engine, the combination of a reciprocating head the body of which comprises separate sections detachably secured together a shaft revolubly mounted parallel with the direction of motion of said head, having a spiral groove or grooves comprising right and left hand sections connected at their ends, a stub shaft or shafts revolubly mounted in a detachable section or sections of said head, and a tongue or tongues thereon which engage said groove or grooves, substantially as described.

2. In an engine, the combination of a reciprocating head, a shaft revolubly mounted parallel with the direction of motion of said head, and having a spiral groove or grooves comprising right and left hand sections connected at their ends, a stub shaft or shafts revolubly and adjustably mounted in bearings in a removable part of said head, and a tongue or tongues thereon which engage said spiral groove or grooves, said tongue or tongues being longer than the width of said grooves, substantially as described.

3. In an engine, the combination of a reciprocating head, a shaft revolubly mounted parallel with the direction of motion of said head, and having spiral grooves comprising right and left hand sections connected at their ends, said grooves being of different depths, stub-shafts revolubly mounted in said head and tongues thereon which engage said grooves.

the tongue of each stub-shaft being proportioned to the depth of the groove within which it is designed to travel, substantially as described.

4. In an engine, the combination of a tight casing constructed to contain a lubricant and provided on its upper side with an opening through which the interior thereof is accessible, a removable plate to close said opening, guides or ways in said casing, a head longitudinally movable in said guides, a shaft revolubly mounted in said casing parallel with said ways and having spiral grooves comprising right and left hand sections connected at their ends, a stub shaft or shafts revolubly mounted in said head and having a tongue or tongues to engage the spiral grooves the reciprocation of the head serving to distribute to the moving parts the lubricant contained within the casing, substantially as described.

5. In an engine, the combination of a tight casing, through an opening in which the interior thereof is accessible, a removable plate which closes said opening, guides or ways in said casing, a head fitted to and longitudinally movable in said guides, a shaft revolubly mounted in said casing parallel with said ways, and having a spiral groove or grooves comprising right and left hand sections connected at their ends, a stub shaft or shafts revolubly mounted in said head, a tongue or tongues on said stub shaft or shafts which engage said spiral groove or grooves, oil-pipes which extend over said guides or ways and over said head adapted to distribute oil upon said guides or ways and upon said head, and means to supply oil to said pipes, substantially as described.

6. In an engine, the combination of a tight casing provided with an opening through which the interior thereof is accessible, a removable plate which closes the opening in said casing, guides in said casing, a head fitted to and longitudinally movable in said guides, a shaft revolubly mounted in said casing parallel with said ways, and having a spiral groove or grooves comprising right and left hand sections connected at their ends, a stub shaft or shafts revolubly mounted in said head, a tongue or tongues thereon which engage said spiral groove or grooves, oil-pipes which extend over said guides and over said head adapted to discharge oil thereupon and a pump within said casing operated by said spirally-grooved shaft adapted to deliver oil from the bottom of said casing to said pipes, substantially as described.

7. The combination with a reciprocating motor, and a cross-head reciprocated thereby, of guides in which said cross-head is movable, a shaft revolubly mounted parallel with said guides, and having spiral grooves comprising right and left hand sections connected at their ends, said grooves being of different depths, stub-shafts revolubly mounted in said cross-head and tongues thereon which engage and are proportioned to the depth of their respective grooves, substantially as described.

8. The combination with a reciprocating motor, and a cross-head reciprocated thereby, of guides in which said cross-head is movably supported, a shaft revolubly mounted parallel with said guides, and having a spiral groove or grooves comprising right and left hand sections connected at their ends, a stub shaft or shafts revolubly mounted in said cross-head, a tongue or tongues thereon which engage said groove or grooves and operative connection between said grooved shaft and a part of the motor for controlling the movement of the motor, substantially as described.

9. The combination with a reciprocating motor, and a cross-head reciprocated thereby, of guides in which said cross-head is movably supported, a shaft revolubly mounted parallel with said guides, and having a spiral groove or grooves comprising right and left hand sections connected at their ends, a stub shaft or shafts revolubly mounted in said cross-head, a tongue or tongues thereon which engage said spiral groove or grooves, a transverse shaft, a gear thereon, a gear on said spirally-grooved shaft and eccentric connection between said transverse shaft and a part of the motor for controlling the movement of the motor, substantially as described.

10. The combination with a reciprocating motor and a cross-head reciprocated thereby, of guides in which said cross-head is movably supported, a shaft revolubly mounted parallel with said cross-head guides, and having a spiral groove or grooves comprising right and left hand sections connected at their ends, a stub shaft or shafts revolubly mounted in said cross-head, a tongue or tongues thereon which engage said groove or grooves, a transverse shaft, a gear thereon engaging a gear on the grooved shaft, and eccentric connections between said transverse shaft and a moving part of the motor (embracing a link-motion) whereby the engine may be reversed, substantially as described.

11. The combination with a motor imparting reciprocating motion, of a tight casing provided with an opening through which the interior thereof is accessible, a removable plate which closes said opening, guides in said casing, a cross-head fitted to and longitudinally movable in said guides, connection between the reciprocating part of the motor and cross-head, a shaft revolubly mounted in said casing parallel with said guides, having a spiral groove or grooves comprising right and left hand sections connected at their ends, a stub shaft or shafts revolubly mounted in said cross-head, a tongue or tongues thereon which engage said groove or grooves, connection between said spirally-grooved shaft and a moving part of the motor said connection comprising a shaft and gear thereon, a gear on said spirally-grooved shaft, a casing which incloses said gears, a pipe which leads from said gear-casing adjacent to the bottom of the casing inclosing said cross-head and adjunctive parts and perforated pipes which lead from said casing over the cross-head and cross-head guides, substantially as described.

709,288. PUMP. RODNEY H. YALE, Beatrice, Nebr. Filed July 29, 1901. Serial No. 70,126. (No model.)

Claim.—1. In a pump for moving liquids, the combination of a piston-chamber, a reciprocating piston therein adapted to move the liquid, a passage-way extending through the piston, a valve controlling said passage-way, and means for holding said valve open against the pressure of the liquid during the working stroke of the piston when said pressure is relatively light, and permitting it to close during said stroke when said pressure is heavier, substantially as set forth.

2. In a reciprocating pump, a piston-chamber and a piston working therein, a tube extending longitudinally from one side of said piston to the other, said tube having an opening at each end, a valve-seat within said tube between said openings, a valve adapted to engage said seat, and a spring adapted to hold said valve open against the pressure of the liquid during the working stroke of the piston when said pressure is relatively light, and permitting it to close during said stroke when said pressure is heavier, substantially as set forth.

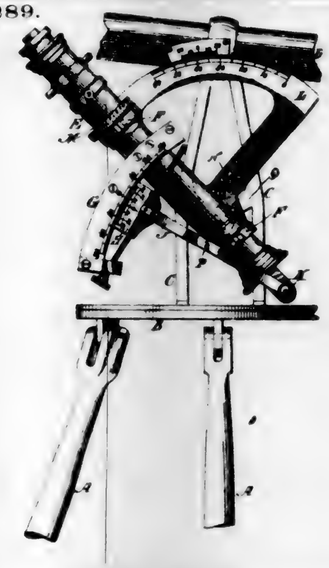
3. In a pump, a cylinder and a piston working therein, said piston comprising a central tube carried by the piston-rod, having openings at the top and bottom for the passage of liquid, and having the usual piston-plates and valve mounted thereon, a valve-seat within said tube, between said openings, and a valve having a head adapted to engage said seat and a tapering stem extending through the seat and bearing against a spring tending to hold said valve normally open, substantially as set forth.

709,289. MERIDIAN ATTACHMENT FOR SOLAR TRANSITS. JAMES H. YOUNG, Pennsauken, N. J., assignor to Alfred C. Young, Philadelphia, Pa. Filed Nov. 30, 1901. Serial No. 84,217. (No model.)

Claim.—1. In a solar transit, a telescope, standards supporting the same, a solar telescope suitably pivoted at a point between said standards and moving independently of said first-mentioned telescope, a latitude-arc in the form of a quadrant connected and moving with said solar telescope, and a declination-arc suitably connected with said solar telescope and adapted to revolve in a plane outside of the plane of said standards.

2. In a solar transit, a telescope, standards supporting the same, a plate pivoted at a point between said standards, collars on said plate on opposite sides of the pivotal point of said plate, a solar telescope revolvable in said collars, a latitude-arc connected with said plate, and a declination-arc and vernier on said solar telescope between said collars, whereby the weight thereof will be distributed equally and improper operation of the parts will be obviated.

709,289.



709,290. DOUGH-CUTTER. GEORGE F. ZIER, Cincinnati, Ohio. Filed May 26, 1902. Serial No. 108,886. (No model.)

Claim.—1. In a dough-cutter, the combination with the hollow body of the implement, the lower end of which is open and the edge of the side of which body around such open end constitutes the cutting edge, of an annular plunger in shape of an open ring fitted with its outer edge all around against the inside of this side, a rod on which it is carried, means connecting it thereto, means to support and guide this rod in a manner to permit the plunger to move to and from the open end of the body, a spring to hold the plunger normally elevated and means to depress the same.

2. In a dough-cutter, the combination with the hollow body of the implement, the lower end of which is open and the edge of the side of which body around such open end constitutes the cutting edge, of a plunger fitted within this open end, a rod on which it is carried, means to support and guide this rod in a manner to permit the plunger to move to and from the open end of the body, a spring to hold the plunger normally elevated, a laterally-projecting push-rod passing through the side of the body and means to operatively connect its inner end with the plunger-rod.

3. In a dough-cutter, the combination with the hollow body of the implement, the lower end of which is open and the edge of the side of which body around such open end constitutes the cutting edge, of a plunger fitted to the inside of the body and supported and guided therein in a manner to permit it to move to and from the open end of the body, a spring to hold the plunger normally elevated, a push-rod passing through the side of the body and with its outer end projecting therefrom and means to operatively connect its inner end with the plunger so that pressure on the push-rod depresses also the plunger.

4. In a dough-cutter, the combination with the hollow body of the implement, the lower end of which is open and the edge of the side of which body around such open end constitutes the cutting edge, of a plunger fitted within this open end, a rod on which it is carried, a frame consisting of upright members and cross-pieces and on which latter the plunger-rod is supported and guided in a manner to permit the plunger to move to and from the open end of the body, a spring encircling the plunger-rod and resting on the upper cross-piece of the frame, a projection on the upper end of the plunger-rod against which the spring also bears, thereby holding the plunger normally elevated, means operatively engaging the plunger-rod for the purpose of moving the same, said means also supported on the frame members and a laterally-projecting push-rod for actuating these means.

5. In a dough-cutter, the combination with the hollow body of the implement, the lower end of which is open and the edge of the side of which body around such open end constitutes the cutting edge, of a plunger fitted within this open end, a rod on which it is carried, means to support and guide this rod in a manner to permit the plunger to move to and from the open end of the body, a spring to hold the plunger normally elevated, a laterally-projecting push-rod passing through the side of the body and an angle-lever which connects the inner end of this push-rod with the plunger-rod.

6. In a dough-cutter, the combination with the hollow body of the implement, the lower end of which is open and the edge of the side of which body around such open end constitutes the cutting edge, of a plunger fitted within this open end, a rod on which it is carried, means to support and guide this rod in a manner to permit the plunger to move to and from the open end of the body, a spring to hold the plunger normally elevated, a laterally-projecting push-rod passing through the side of the body, a segmental pinion to which the inner end of this push-rod connects and teeth on the plunger-rod in mesh with the teeth of the pinion.

7. In a dough-cutter, the combination with the hollow body of the implement, the lower end of which is open and the edge of the side of which body around such open end constitutes the cutting edge, of an annular plunger fitted within this open end, a rod on which it is carried and of which it forms an integral part, the lower part of such rod being for such purpose bent and shaped accordingly, means to support and guide this combined plunger and rod in a manner to permit them to move to and from the open end of the body, a spring to hold this structure normally elevated and means to depress the same.

709,291. OLEAGINOUS COMPOUND. CURRING ADAMS, Bellows Falls, Vt. Filed June 7, 1901. Serial No. 63,591. (No specimens.)

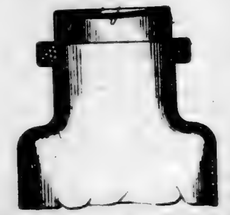
Claim.—1. The herein-described oleaginous compound or composition of matter, consisting of approximately seven parts of a solution of cassin and sixty parts of a vegetable oil, thoroughly mixed and incorporated together, substantially as set forth.

2. The herein-described oleaginous compound or composition of matter, consisting of approximately seven parts of a solution of cassin and sixty parts of cotton-seed oil, thoroughly mixed and incorporated together, substantially as set forth.

3. The herein-described process for thickening or solidifying a vegetable oil to produce an oleaginous compound, such process consisting in gradually adding, with constant agitation, to about sixty parts of the oil to be thickened or solidified, about seven parts of a solution of cassin, substantially as set forth.

4. The herein-described process for thickening or solidifying cotton-seed oil to produce an oleaginous compound, such process consisting in gradually adding, with constant agitation, to about sixty parts of the oil to be thickened or solidified, about seven parts of a solution of cassin, substantially as set forth.

709,292. BOTTLE-CLOSURE. GEORGE J. ADAMS, Brooklyn, N. Y., assignor to Colgate & Company, New York, N. Y. Filed Feb. 27, 1902. Serial No. 96,864. (No model.)

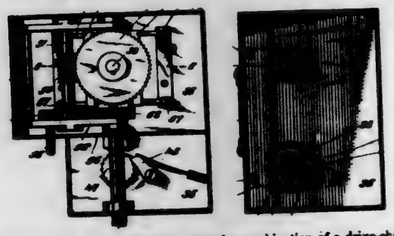


Claim.—1. A bottle-closure comprising a fixed cap having a perforated top, a cap having screw-threaded engagement with the first-named cap and also having a perforated top, and means for limiting the rotary movement of the last-named cap relatively to the first-named cap, the top portions of said caps being of spring yielding material, so as to maintain close engagement one with the other when the rotary cap is rotated, substantially as specified.

2. A bottle-closure comprising a cap having a flange engaging around

a bead on the neck portion of the bottle, the said cap having a perforated top, a cap mounted to rotate on the first-named cap and having a perforated top, the said tops being of spring yielding material, so as to maintain close engagement one with the other when the rotary cap is rotated, and means for limiting the rotary movement of the last-named cap, substantially as specified.

709,298. STATION-INDICATOR. JAMES S. ANDERSON, Brooklyn, N. Y. Filed May 2, 1901. Serial No. 58,620. (No model.)



Claim.—1. In a station-indicator, the combination of a drive-shaft, a frame mounted to swing around the axis thereof, a worm carried in the frame and geared with the drive-shaft, a worm-wheel mounted stationary with respect to the frame and adapted to be engaged on either side by the worm, the frame being capable of swinging with the worm from one side of the worm-wheel to the other and indicating devices driven from the worm-wheel.

2. In a station-indicator the combination of a drive-shaft, a frame mounted to swing around the axis thereof, a worm mounted in the frame and swinging therewith, a gear connected with the worm, a gear mounted on the drive-shaft and meshed with the gear of the worm, a worm-wheel stationary with respect to the frame and engaged by the worm, the frame being capable of swinging to either side of the worm-wheel, for the purpose specified, and indicating devices driven from the worm-wheel.

3. In a station-indicator the combination of a drive-shaft, a frame arranged to swing around the axis thereof, a worm carried by the frame and driven by the drive-shaft, a worm-wheel arranged adjacent to the frame and capable of being engaged at either side by the worm, indicating devices driven from the worm-wheel and a spring-pressed arm at each side of the worm-wheel to engage and hold the frame in either position.

4. The combination with a railway-car, of a station-indicator carried thereby, a shaft arranged to drive the station-indicator, a wheel carried to swing around the axis of the shaft and geared therewith, the wheel being adapted to run on the ground, and a spring serving to hold the wheel yieldingly in a certain position with respect to the shaft.

5. The combination of a shaft, an arm arranged to swing around the axis thereof, a fork carried by the arm, a wheel mounted in the fork, gearing connecting the wheel to the shaft, and a spring serving to hold the fork and arm yieldingly in a certain position with respect to the shaft.

6. The combination with a railway-car, of an indicator mounted therein, a drive-shaft in the indicator, a shaft extending downward in proximity to the ground, the latter shaft having sliding connection with the drive-shaft of the indicator, and means connected with the latter shaft for imparting movement thereto.

7. A traction-wheel, comprising a wheel proper, a flexible tire arranged thereon, an expansive ring fitted within the tire, and means for forcing the ring outward to expand it against the tire.

8. The combination of an apron, two winding members connected together and also connected with the ends of the apron and adapted to have the apron wound thereon, means for transmitting winding movement to one of said winding members, the other of said winding members comprising an axial shaft, a drum mounted loosely thereon, a spring-arm lying wholly within the drum and fastened to the shaft intermediate the ends of the arm, and curved friction-shoes fastened to each end of the spring-arm and engaged with the inner circumference of the drum, for the purpose specified.

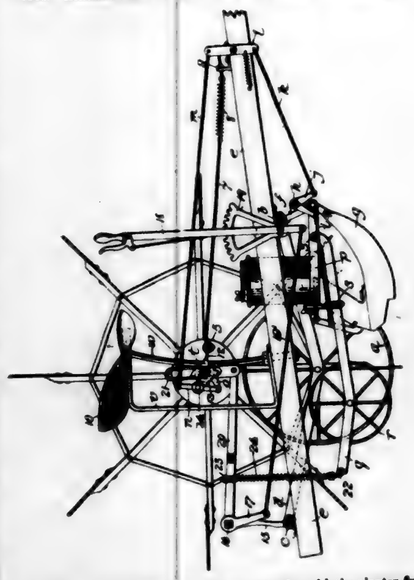
9. The combination of an apron, a winding member in connection with one end thereof, means for imparting movement to said member in either direction, a drum in connection with the other end of the apron, an axial shaft on which the drum is loosely mounted, means for establishing a frictional connection between the shaft and drum, and gearing connecting together the said winding member and the shaft, said gearing including a gear loose on the shaft and pawl-and-ratchet devices for rendering said gear fast to the shaft when the gear turns in one direction.

10. The combination of an apron, a winding member in connection with one end thereof, means for imparting movement to said member in either direction, a drum in connection with the other end of the apron, an axial shaft on which the drum is loosely mounted, means for establishing a frictional connection between the shaft and drum, and gearing connecting together the said winding member and the shaft, said gearing including a gear loose on the shaft and pawl-and-ratchet devices for rendering said gear fast to the shaft when the gear turns in one direction, and a second pawl and ratchet connected with the shaft to prevent idle movement of the shaft during the period that the before-mentioned gear turns loosely thereon.

11. In a station-indicator, the combination of a rotary driving member, a frame mounted to swing around the axis thereof, indicating devices, and gearing for driving the indicating devices from the said rotary driving member, said gearing comprising a gear element mounted on the swinging frame and connected with the rotary driving member and a gear element connected to the indicating devices, the frame being adapted to swing to engage the first-named gear element with either side of the second-named gear element, for the purpose specified.

12. In a station-indicator, the combination of an apron, a winding member connected with one end thereof, means for turning said member in either direction, a drum connected with the other end of the apron, a shaft on which the drum is frictionally mounted for the purpose specified, and means connecting together the shaft and the said winding member, said means driving the shaft from the winding member in one direction only.

709,294. CORN-PLANTER. JAMES BARCLAY, Moline, Ill., assignor to the Deere and Mansur Company, Moline, Ill. Filed June 7, 1900. Renewed June 25, 1902. Serial No. 113,145. (No model.)



Claim.—1. In a corn-planter, the combination with the planter-frame, of a check-row marker connected to the planter so as to rise and fall freely independently thereof, said marker being also pivotally connected with the planter so as to permit the latter to oscillate horizontally independently of the marker, and means for preventing the marker from swinging bodily laterally with respect to the planter.

2. In a corn-planter, the combination with the planter-frame, of a check-row marker connected to the planter so as to rise and fall freely independently thereof, said marker comprising a shaft and spade-wheels, and being pivotally connected with the planter so as to permit the latter to oscillate horizontally independently of the marker, and means for imparting an endwise movement only to the marker-shaft corresponding to the sidewise deflection of the planter.

3. In a corn-planter, the combination with the planter-frame, of a check-row marker connected to the planter so as to rise and fall freely independently thereof, said marker comprising a shaft and spade-wheels, and being pivotally connected with the planter so as to permit the latter to oscillate horizontally independently of the marker, and means for converting the sidewise movement of the planter due to crooked driving into an endwise movement only of the marker-shaft without swinging the latter shaft.

4. In a corn-planter, the combination with the planter-frame, of a check-row marker connected to the planter so as to rise and fall freely independently thereof, said marker comprising a shaft and spade-wheels, the shaft of the marker being located over the planter-supporting wheels and in substantially the vertical plane of said wheels' axis, and the marker being pivotally connected with the planter, so as to permit the latter to oscillate horizontally independently of the marker.

5. In a corn-planter, the combination with the planter-frame, of a check-row marker connected to the planter so as to rise and fall freely independently thereof, said marker comprising a shaft and spade-wheels, the shaft of the marker being located over the planter-supporting wheels and in substantially the vertical plane of the said wheels' axis, and the marker being pivotally connected with the planter at substantially the central point between the planter-wheels so as to permit the planter to oscillate horizontally independently of the marker.

6. In a corn-planter, the combination with the planter-frame, of a check-row marker connected to the planter so as to rise and fall freely independently thereof, said marker being also pivotally connected with the planter so as to permit the latter to oscillate horizontally independently of the marker, and an elastic spring connection between said marker and planter.

7. In a corn-planter, the combination with the planter-frame, of a check-row marker connected to the planter so as to rise and fall freely independently thereof, said marker being also pivotally connected with the planter so as to permit the latter to oscillate horizontally independently of the marker, a bar extending forwardly from the marker in the line of the planter-tongue, and a fore-and-aft spring reacting between said bar and tongue.

8. In a corn-planter, the combination with the planter-frame, of a check-row marker connected to the planter so as to rise and fall freely independently thereof, said marker being also pivotally connected with the planter so as to permit the latter to oscillate horizontally independently of the marker, and an elastic draft connection between the marker and the planter.

9. In a corn-planter, the combination with the planter-frame, of a check-row marker connected to the planter so as to rise and fall freely independently thereof, said marker being also pivotally connected with the planter so as to permit the latter to oscillate horizontally independently of the marker, a bar extending forwardly from the center of the marker in the line of the planter-tongue, a spring connected at its rear end to the forward end of the bar and at its forward end to the planter-tongue, and means for regulating the tension of the spring.

10. In a corn-planter, the combination with the planter-frame, of a check-row marker connected to the planter so as to rise and fall freely independently thereof, said marker comprising a shaft and spade-wheels, the shaft of the marker being located over the planter-supporting wheels and in substantially the vertical plane of the axis of said wheels, and the marker being pivotally connected with the planter at substantially the central point between the planter-wheels, and an elastic draft connection between said marker and planter at a point forward of and in line with the pivotal connection between the two.

11. In a corn-planter, the combination of the planter-frame, a post rising from the frame, a check-row marker comprising a shaft and spade-wheels, said shaft being pivotally connected with the post so as to oscillate thereon and be held thereby against lateral movement independently of the planter.

12. In a corn-planter, the combination of the planter-frame, a post rising centrally from the frame, a check-row marker comprising a shaft and spade-wheels, a transverse bar in front of the shaft and connected thereto by clips sleeved on the shaft, a draft-rod extending forward from the transverse bar, and a spring connecting the front end of the draft-rod with the planter-tongue in line with the rod.

13. In a corn-planter, the combination of the planter-frame, a post rising centrally from the frame, a check-row marker comprising a shaft and spade-wheels, said shaft being pivotally connected with the post so as to oscillate thereon, and be held thereby against lateral movement independently of the planter, a tappet-wheel on the marker-shaft in proximity to the post, and connections from said tappet-wheel to the seed-dropping devices of the planter, whereby the marker-shaft is permitted to rise and fall, and the planter-frame to oscillate independently thereof, without disconnecting the tappet-shaft from the seed-dropping connections.

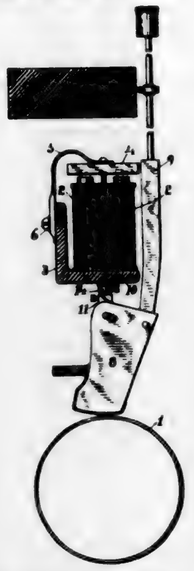
14. In a corn-planter, the combination of the planter-frame, a post rising centrally from the frame, a check-row marker comprising a shaft and spade-wheels, and a transverse bar in front of the shaft and connected thereto by clips sleeved on the shaft, said post being embraced between the central clip in front and a friction-roller on the shaft behind.

15. In a corn-planter, the combination with the planter-frame having a tongue rigid therewith, and supporting-wheels each journaled at opposite ends of the frame in a pair of arms rigidly connected to the front transverse bar of the frame.

16. In a corn-planter, the combination of a single frame consisting of front and rear transverse bars, and a tongue rigidly connected with said frame, a pair of parallel bars connecting the front and rear sills of the frame at opposite ends, and supporting-wheels journaled in said connecting-bars.

17. In a corn-planter, the combination with the planter-frame, of a check-row marker connected to the planter so as to rise and fall independently thereof, said marker being also pivoted to the planter so as to allow the latter to oscillate horizontally independently of the marker.

709,295. ELECTRICAL SELF-PLAYING MUSICAL INSTRUMENT. HARRY B. BEACH, Newark, N. J., assignor, by mesne assignments, to G. Howlett Davis, Llewellyn Park, West Orange, N. J. Filed Sept. 3, 1901. Serial No. 74,053. (No model.)



Claim.—1. In a self-playing musical instrument, the combination substantially as described, of a friction-shoe and actuating-drum and an electromagnet, of an extensible connection connecting the armature of the electromagnet and friction-shoe, and an adjustable stop device also carried by the armature and capable of adjustment independently of the adjustable connection between the armature and shoe.

2. In a self-playing attachment for musical instruments, the combination substantially as described of a friction-drum, a friction-shoe, an electromagnet, an armature connected with said shoe, a support for the armature and magnet adjustable toward and from the drum, and stop devices for the armature whereby the air-gap may be limited, said stop devices being carried by the armature and magnet support and both movable therewith when said support is adjusted to and from the drum.

3. In a self-playing attachment for musical instruments, the combination with a bank of magnets, armatures and spring-retracted friction-shoes, of adjustable stop devices for each armature of the bank, an adjustable bar or angle-piece supporting all of said parts, retracting-springs for said armatures wholly supported by said bar, and an actuating roller or drum with reference to which said bar or angle-piece is adjustable.

4. The combination in a self-playing musical instrument, of the bar 3 carrying the gang of magnets, an armature, an armature-rod 10 connected to said armature, a pivoted friction-shoe adjustably supported upon the rod, an adjustable collar 14 upon said rod and an operating roller or drum 4, as and for the purpose described.

5. In a self-playing musical instrument, the combination of an electromagnet, an actuating-drum, a pivoted shoe, an armature, a stop device adapted to limit the movement of the parts on the back stroke of the armature to limit the width of the air-gap, and an adjustable connection be-

tween the armature and shoe adjustable independently of said stop devices, as and for the purpose described.

709,296. **END-FASTENER FOR PERFORATED MUSIC-SHEETS.** HARRY B. BEACH, Newark, N. J., assignor, by mesne assignments, to G. Howlett Davis, Llewellyn Park, West Orange, N. J. Filed Oct. 16 1901. Serial No. 78,789. (No model.)

Claim.—1. The combination, with a perforated music-sheet, having an end portion provided with tapering edges, of an end-fastener, comprising, an enlarged member having tapering edges corresponding to the tapering edges of said music-sheet, said enlarged member being adapted to be arranged on one side of the said end portion of the music-sheet, a tongue extending from said enlarged member, said tongue being bent to form a loop and adapted to be arranged against the other side of the said end portion of the music-sheet, and a reinforcing-strip placed between the said enlarged member and the tongue of the end-fastener and the respective surfaces of the end portion of the said music-sheet, all of the said parts being secured in place, substantially as and for the purpose set forth.

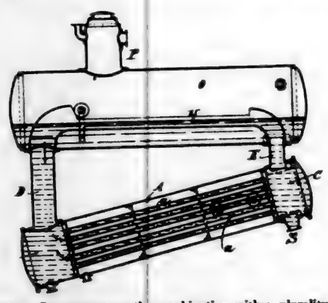
2. The combination, with a perforated music-sheet, and a reinforcing means, such as a piece of paper or a label, attached to the said sheet, of an end-fastener, comprising, an enlarged member adapted to be secured on one side of the said end portion of the music-sheet, a squared end 9 forming a part of said enlarged member, over which a portion of the said reinforcing means is arranged and secured, and a tongue extending from said enlarged member, said tongue being bent over to form a loop and secured to the other side of the said end portion of the music-sheet, substantially as and for the purpose set forth.

3. The combination, with a perforated music-sheet, and a reinforcing means, such as a piece of paper or a label, attached to the said sheet, of an end-fastener, comprising, an enlarged member adapted to be arranged on one side of the said end portion of the music-sheet, a squared end 9 forming a part of said enlarged member, over which a portion of the said reinforcing means is arranged, and a tongue extending from said enlarged member, said tongue being bent into a loop and adapted to be arranged against the other side of the said end portion of the music-sheet, and a reinforcing-strip 16 placed between the said enlarged member and the tongue of the end-fastener and the respective surfaces of the end portion of the said music-sheet, all the said parts being secured in place, substantially as and for the purpose set forth.

4. The combination, with a perforated music-sheet, having an end portion provided with tapering edges, and a reinforcing means, such as a piece of paper or a label, attached to said end portion, of an end-fastener, comprising, an enlarged member having tapering edges corresponding to the tapering edges of said music-sheet, said enlarged member being adapted to be secured on one side of the said end portion of the music-sheet, the said tapering edges of said end-fastener terminating directly upon the tapering marginal edges of the music-sheet, whereby said edges are reinforced to prevent curling and tearing of the music-sheet, a squared end 9 forming a part of said enlarged member, over which a portion of the said reinforcing means is arranged and secured, and a tongue extending from said enlarged member, said tongue being adapted to be bent over to form a loop and secured to the other side of the said end portion of the music-sheet, substantially as and for the purpose set forth.

5. The combination, with a perforated music-sheet, having an end portion provided with tapering edges, and a reinforcing means, such as a piece of paper or a label, attached to said end portion, of an end-fastener, comprising, an enlarged member having tapering edges corresponding to the tapering edges of said music-sheet, said enlarged member being adapted to be arranged on one side of the said end portion of the music-sheet, a squared end 9 forming a part of said enlarged member, over which a portion of the said reinforcing means is arranged and secured, and a tongue extending from said enlarged member, said tongue being bent to form a loop and adapted to be arranged against the other side of the said end portion of the music-sheet, and a reinforcing-strip placed between the said enlarged member and the tongue of the end-fastener and the respective surfaces of the end portion of the said music-sheet, all of the said parts being secured in place, substantially as and for the purpose set forth.

709,297. **EVAPORATOR.** WILHELM RENDER, Düren, Germany, assignor to The Firm of Zellstoffabrik Düren Hermann Maria Schoeller & Co., Düren, Germany. Filed June 11, 1901. Serial No. 64,166. (No model.)



Claim.—In evaporators the combination with a plurality of tubes situated in an inclined position, a steam-jacket surrounding these tubes, chambers connected by means of the tubes and upright tubes connecting these chambers with a cylindrical reservoir, a cylindrical reservoir for gathering the vapors and a U-shaped trough-like channel open on its upper side, situated within the reservoir and connecting the upper ends of the upright tubes, substantially as described and for the purpose set forth.

709,298. **SHELL-ROLLS FOR SPINNING-MACHINES.** ARTHUR O. BOGERS, Tucapau, S. C. Filed Mar. 20, 1902. Serial No. 99,186. (No model.)

Claim.—1. In shell-rolls for spinning-machines, the combination of a hollow arbor and spindles, an oil-duct through the arbor which communicates with the chamber within the spindles, sleeves of larger interior diameter than the exterior diameter of the spindles, hollow trunnions which connect the inner sleeves to the spindles and at the same time provide oil-passages between the chamber in the spindles and the exterior of the inner sleeves, outer sleeves rotatively mounted on the inner sleeves, and antifriction-rolls between the shells, substantially as shown.

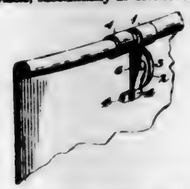
2. In top rolls for spinning-machines, the combination of non-rotative spindles, an inner shell pivoted thereto and capable of an oscillatory movement on the spindle, a pet carried by the outer end of the inner sleeve, an outer sleeve rotatively mounted on the inner sleeve and held against longitudinal movement in one direction by the nut, and antifriction-rolls between the shells, substantially as shown.

3. In shell-rolls for spinning-machines, the combination of a hollow arbor and spindles constructed to provide an oil-duct between the arbor and the spindles, an inner shell with flanges adjacent to the arbor and screw-threads near their outer ends, hollow trunnions pivotally connecting the inner shells to the spindles and providing oil-passages from the hollow spindles to the outer faces of the inner shells, nuts on the screw-threaded ends of the inner shells, antifriction-rolls between the shells and also between the flanges and nuts on the inner shells, and a shell-roll of sufficient length to cover the outer shell and the nuts, substantially as shown.

4. The combination with a non-rotative spindle, an inner shell of greater internal diameter than the external diameter of the spindle, hollow trunnions between the spindle and inner shell, an outer shell rotatively mounted on the inner oscillatory shell, a shell-roll carried by the outer rotary shell, and means removably connected to the non-rotative shell to hold the outer shell against longitudinal movement thereon, substantially as shown.

709,299. **BUCKET-BAR.** FRED T. BROSS, Quincy, Ill. Filed May 17, 1902. Serial No. 107,787. (No model.)

Claim.—1. A bail attacher comprising two body members bearing apertured ears connected at their tips, the apertures in said ears being formed by cutting out ears which are located to be turned over to secure the attacher to a receptacle, substantially as described.



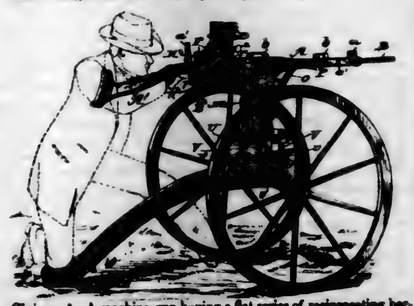
2. A handle and bail attacher, comprising two body members having lugs and apertured ears, said ears being connected at their tips, said ears being constructed to engage a slit in a receptacle and extend at right angles to said body members, and said lugs being adapted to be bent over to engage the sides of said slit, substantially as described.

709,300. **FENCE-POST.** JOSEPH BOGUTH, Portland, Oreg. Filed Apr. 17, 1901. Serial No. 56,254. (No model.)

Claim.—1. A fence-post, consisting in combination, a post or standard, having means for receiving and holding the wire strands, and having a circular shank, an anchor member having a top portion, provided with a central aperture, the edges of which have downwardly-bent clamping-prongs to engage the shank of the post, said anchor member having short pendent flanges on two of its opposite sides, and long penetrating members at the two other sides, said members having outwardly-bent anchoring-ribs, substantially as shown and described.

2. As an article of manufacture, an anchor member for fence-posts, consisting of a top portion having a central aperture, the edges of which have downwardly-bent clamping-prongs to engage the post; said anchor member having downwardly-bent flanges on two of its opposite sides and long downwardly-extending penetrating members on the two other sides, said penetrating members having outwardly-bent anchoring-ribs, as shown and described.

709,301. **MACHINE-GUN.** EDWIN M. GATTS, San Diego, Cal. Filed Nov. 1, 1901. Serial No. 80,807. (No model.)



Claim.—1. A machine-gun having a flat series of reciprocating barrels combined with a supporting-frame, the barrels and frame being detachably connected by lugs and seats having vertical outlets whereby the barrels are made removable by a vertical lifting action, substantially as described.

2. A machine-gun having a flat series of barrels with transverse connecting-bars, lugs, and one or more handholds, combined with a supporting-frame having seats with upwardly-opening outlets and made removable therefrom by a vertical lifting action, substantially as described.

3. A machine-gun comprising a flat series of barrels having laterally-projecting lugs, combined with a supporting-frame having along its inner sides oppositely-facing grooves having outlets on their upper sides to permit the lugs to be lifted out.

4. A machine-gun comprising a flat series of barrels, a frame with guides adapted to receive said barrels and two check-blocks, one on each side of the barrels for locking the same against the explosive strain there being a free open space between the check-blocks above the barrels to permit the upward removal of the same.

5. A machine-gun comprising a flat series of barrels, a frame with guides adapted to receive said barrels, two check-blocks, one on each side of the barrels for holding the same against explosive strain and a spring for positively holding the check-blocks down, said spring being located behind the cartridge-feeding devices.

6. In a machine-gun having a horizontal flat series of barrels, the combination with said barrels of an independent vertical feed-throat for each barrel located in the rear of the breech end of the barrel and adapted to receive a separate strip of cartridges for each barrel, the cartridges of each strip being connected together and separately fed down its own guide whereby free individual feed for each barrel is maintained without cramping and binding from expansion by heat.

7. In a machine-gun having a horizontal flat series of barrels, the combination with the barrels and means for reciprocating them longitudinally; of an independent vertical feed-throat for each barrel having overhanging edges adapted to receive a strip bearing cartridges, said feed-throats having between them above the level of the barrels horizontally-projecting blades d^9 lying against the cartridges and arranged in vertical planes to guide the cartridges to proper alinement to enter the barrels.

8. In a machine-gun having a horizontal flat series of barrels, the combination of a series of vertical feed-throats extending transversely to the barrels at the breech end; an independent holder-strip for each series of cartridges for each barrel permanently fixed to each cartridge and having holes alternating with the cartridges, separate feed devices adapted to enter said holes and a detachable carrier with means for locking each strip of cartridges in the carrier the same distance apart as the feed-throats and simultaneously inserting them all into the feed-throats.

9. In a machine-gun having a horizontal flat series of barrels, the combination of a series of vertical feed-throats extending transversely to the barrels at the breech end; an independent holder-strip for each series of cartridges for each barrel having holes alternating with the cartridges, separate feed devices adapted to enter said holes and a detachable carrier for holding the cartridge-strips in alinement with the feed-throats said carrier consisting of a flat plate with spurs at its lower end adapted to enter the holes in the cartridge-holders and said plate also having spacing devices, and a handle, and also right-angular flanges on its opposite edges with slots forming locking-seats, and a locking-rod passing over the cartridge-holders and through said locking-seats.

10. The combination with a machine-gun having a flat series of barrels; of a transverse feed-trough having on its front side a separate channel-guide for each barrel, cartridge-holders for each guide having rigidly-fixed cartridges therein with alternating feed-holes, and a positively-acting feed-finger for each cartridge-holder.

11. In a machine-gun, the combination with the feed mechanism; of a firing mechanism comprising a rotary horizontal shaft having transverse slots c cut in the same, a series of horizontal firing-plungers H^3 arranged below said rotary shaft and having triggers h' projecting upwardly in rear of the said shaft and in line with the slots, a series of fixed tubular guides H' embracing the plungers and having slots at their rear ends, a stationary anchorage-bar H connected to the rear ends of said tubular guides, and a series of pendent springs H^3 fixedly supported at their upper ends and depending through the slots in the tubular guides and bearing against the plungers substantially as shown and described.

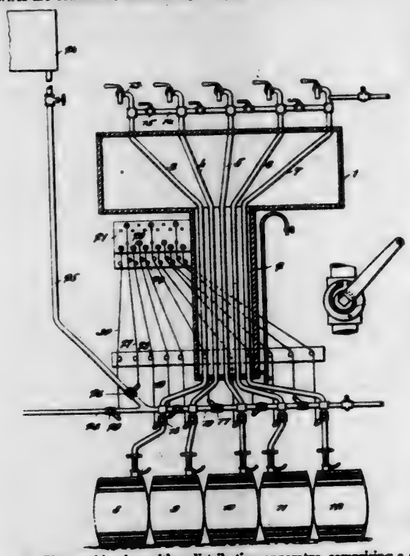
12. In a machine-gun, the combination with the cartridge-holders; of a reciprocating shaft having loosely-hung fingers thereon adapted to engage cartridge-holders, and having a projecting member arranged between two yielding surfaces which alternately lift the fingers and pull down the cartridge-holders as the shaft reciprocates.

13. In a machine-gun, the combination with cartridge-holders having a series of feed-openings along the same; of a reciprocating shaft H^2 having loosely-hung fingers I with downwardly-projecting members I', the guide J, the yielding bar K with springs K', and the springs L, the members I' being arranged to play between the bar K and springs L.

709,302. **PIPE-CLEANING APPARATUS.** EDWARD D. GAGE, Flint, Mich. Filed Nov. 7, 1901. Serial No. 81,376. (No model.)

Claim.—1. In a pipe-cleaning apparatus, the combination with a pipe to be cleaned, of a tank for cleaning solution arranged above the

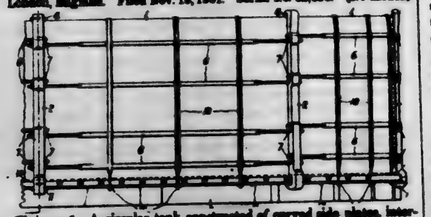
outlet of the pipe, a downwardly-extending valve-controlled pipe leading from said tank, a valve-controlled water-inlet pipe connected with the pipe leading from the tank, the said pipes having a common communication with the pipe to be cleaned, cords or wires extending from the valve of the water-inlet pipe and the valve of the pipe leading from said tank, and a keyboard provided with turning devices to which said cords or wires are connected, substantially as specified.



2. The combination with a distributing apparatus comprising a series of upwardly-extending pipes, a pipe connecting the lower parts of said series of pipes, a water-inlet pipe having direct connection with one end of said connecting-pipe, a tank for cleaning solution arranged above the upper or outlet ends of the distributing-pipes, and a pipe leading downward from said tank to a connection with the water-inlet pipe at or near its point of connection with the said connecting-pipe, a valve in said pipe leading from the tank, a valve in the water-inlet pipe, the said valves being located near the junction of said pipes, and valves in the connecting-pipe between the distributing-pipes, substantially as specified.

3. In a beer-distributing apparatus, a series of distributing-pipes, horizontally-extending pipe connections, between the upper portion of said pipes, valves arranged in said connecting-pipes between the distributing-pipes, horizontally-extending pipe connections between the lower portions of said distributing-pipes, valves in said connecting-pipes between the distributing-pipes, a water-inlet pipe connected direct with the lower connecting-pipes, a tank for cleaning solution supported above the outlet ends of the distributing-pipes, and a downwardly-extending valve-controlled pipe connecting said tank with the water-inlet pipe near its junction with the said connecting-pipes, substantially as shown and described.

709,303. CONSTRUCTION OF TANKS. EDWARD D. CHESTER, London, England, assignor to Edward Chester & Company, Limited, London, England. Filed Nov. 18, 1901. Serial No. 82,856. (No model.)



Claim.—1. A circular tank constructed of curved side plates, intermediate standards grooved to receive and make joint with the ends of the plates, a floor or bottom having the margin of its upper surface rabbeted to present both vertical and horizontal abutment-surfaces for making joint with the side plates and standards, circumferentially-extending tie-rods connecting each two adjacent standards and adapted to draw the plates and standards together, and means for drawing both the standards and the plates down upon the horizontal abutment-surface of the rabbeted margin of the tank-bottom, substantially as described.

2. A circular tank constructed of curved side plates, intermediate standards grooved to receive and make joint with the ends of the plates, circumferentially-extending tie-rods connecting each two adjacent standards, a floor or bottom extending beneath the lower edge of said plates, jaws formed on the lower ends of the standards and embracing the edge of the floor, and wedges interposed between the tank-bottom and the lower jaws of the standards for drawing the standards tightly down upon the tank-bottom.

3. A circular tank constructed of curved side plates, intermediate standards grooved to receive and make joint with the ends of the plates, circumferentially-extending tie-rods connecting each two adjacent standards, a floor or bottom extending beneath the lower edge of said plates, jaws formed on the lower ends of the standards and embracing the edge of the floor, a metal ring extending around the circuit of the tank beneath the under side of the margin of the bottom for binding together the floor-planks, and wedges interposed between the said ring and the lower jaws of the standards for drawing the standards tightly upon the tank-bottom.

4. A circular tank constructed of curved side plates, intermediate standards grooved to receive and make joint with the ends of the plates, circumferentially-extending tie-rods connecting each two adjacent standards, a floor or bottom extending beneath the lower edge of said plates, jaws formed on the lower ends of the standards and embracing the edge of the floor, wedges interposed between the tank-bottom and the lower jaws of the standards for drawing the standards tightly down upon the tank-bottom, slots in the upper ends of the standards in alinement with the grooves thereof, and wedges driven into the slots and bearing upon the upper edges of the plates for the purpose of pressing the lower edges of the plates down upon the tank-bottom.

5. A circular tank constructed of curved side plates, intermediate standards grooved to receive and make joint with the ends of the plates, circumferentially-extending tie-rods connecting each two adjacent standards, a floor or bottom extending beneath the lower edge of said plates, jaws formed on the lower ends of the standards and embracing the edge of the floor, wedges interposed between the tank-bottom and the lower jaws of the standards, and hook tie-bolts engaging with the upper edge of the side plates intermediate of the standards, the bolts being provided with tightening means, said means abutting against the under side of the tank-bottom so as to draw the lower edges of the plates down upon the tank-bottom.

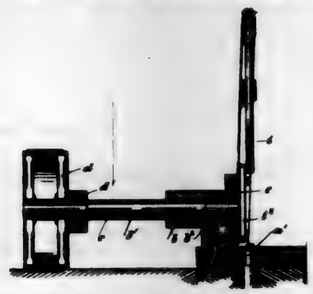
6. A circular tank constructed of curved side plates, intermediate standards grooved to receive and make joint with the ends of the plates, circumferentially-extending tie-rods connecting each two adjacent standards, a floor or bottom extending beneath the lower edge of said plates, jaws formed on the lower ends of the standards and embracing the edge of the floor, wedges interposed between the tank-bottom and the lower jaws of the standards for drawing the standards tightly down upon the tank-bottom, slots in the upper ends of the standards in alinement with the grooves thereof, wedges driven into the slots and bearing upon the upper edges of the plates, and hook tie-bolts engaging with the upper edge of the side plates intermediate of the standards, the bolts being provided with tightening means, said means abutting against the under side of the tank-bottom so as to coact with the standards and their wedges in forcing the lower edges of the plates down upon the bottom of the tank.

7. A circular tank constructed of sides formed of curved plates with intermediate standards grooved to receive and make joint with the ends of the plates and provided with jaws extending beneath the tank-bottom, tie-rods connecting the standards circumferentially of the tank for drawing adjacent standards toward one another, a floor or bottom extending beneath the lower edge of the plates, wedges interposed between the standards and upper edge of the plates, wedges interposed between the jaws of the standards and the bottom of the tank for forcing the plates and bottom together, and hook-bolts intermediate of the standards, said bolts engaging with the upper edge of the plates and extending through the bottom of the tank and having nuts for drawing the plates and bottom of the tank together, substantially as specified.

8. In a circular tank constructed with curved side plates and intermediate standards grooved to receive and make joint with the ends of the plates, the combination with the plates and standards, of a circumferential series of ties in non-alined sections, the series forming with the standards to which they are connected a completely-closed circle, each tie-rod connecting two adjacent standards by the ends of the said tie-rod passing through holes in the standards and having tightening means bearing against the standards, the tightening means of consecutive rods bearing against opposite sides of the same standards so as to enable the joints between each pair of adjacent standards and the intermediate side plate to be independently tightened without disturbing the remainder.

9. A tank constructed of plates, standards intermediate of the plates, and a bottom or floor extending beneath the lower edge of the plates, the standards being adapted at one end to engage the upper edge of the tank and being provided at the other end with jaws which extend beneath the bottom or floor so as in conjunction with wedges or their equivalent to constitute cramps whereby to force the plates and standards against the bottom and so make a tight joint, substantially as specified.

709,304. POWER MECHANISM. FERDINAND CLEMENS, Jr., Delta, Iowa. Filed Sept. 12, 1901. Serial No. 75,208. (No model.)



Claim.—1. The combination of a turning support, a vertically-extending frame erected thereon, a box mounted on the support, a shaft arranged to turn in the box, a traction-wheel connected to the shaft and running on the ground to rotate the shaft as it swings with the turning support, a crank attached to the inner end of the shaft, a connecting-rod attached to the crank, a slide mounted in the frame and attached to the connecting-rod, and a walking-beam with which the upper end of the slide is revolubly engaged.

2. The combination of a support arranged to turn on a vertical axis, a box hingedly mounted thereon, a shaft revolubly carried in the box, the shaft running radially of the axis of the turning support, a traction-wheel carried by the shaft and running on the ground to rotate the shaft as it swings with the turning support, a vertically-extending frame mounted rigidly on the turning-support, a crank in connection with the inner end of the shaft, a connecting-rod attached to the crank, a slide mounted in the frame and attached to the connecting-rod, and a walking-beam with which the upper end of the slide is loosely connected.

3. The combination of a support arranged to turn, a tube carried to swing with the support, a shaft revolubly mounted in the tube, means connected with the inner end of the shaft to transmit the motion thereof, a wheel carried on the outer end of the shaft and running on the ground as the shaft swings with the support, a beam mounted transversely on the tube alongside of the wheel, and weight-boxes attached to the ends of the beam and extending past the face of the wheel, for the purpose specified.

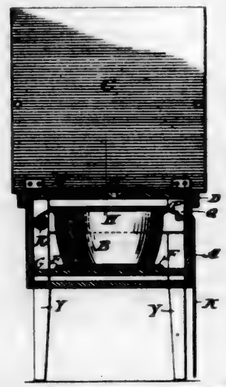
4. The combination of a support arranged to turn, a tube carried to swing with the support, a shaft revolubly mounted in the tube, means connected with the inner end of the shaft to transmit the motion thereof, a wheel carried on the outer end of the shaft and running on the ground as the shaft swings with the support, a beam mounted transversely on the tube alongside of the wheel, weight-boxes attached to the ends of the beam and extending past the face of the wheel, for the purpose specified, and a flange attached to one of the weight-boxes and adapted to have the draft apparatus engaged therewith.

5. The combination of a support arranged to turn, a tube carried to swing with the support, a shaft revolubly mounted in the tube, means connected to the inner end of the shaft to transmit the movement thereof, a wheel carried on the outer end of the shaft and running on the ground as the shaft swings with the support, and a weight sustained on the outer portion of the tube, for the purpose specified.

6. The combination of a turning support, a shaft revolubly mounted on the support, means connected to the inner end of the shaft to transmit the motion thereof, a wheel carried on the outer end of the shaft and running on the ground as the shaft swings with the support, a weight located immediately adjacent to the wheel, and means engaged with the shaft and with said turning support, whereby to sustain the weight.

709,305. SANITARY COMMODE. LYMAN B. DAMON, Dexter, Me. Filed July 13, 1901. Serial No. 66,726. (No model.)

Claim.—1. In a commode of the character described, an inclined floor; a vessel suitable to be used therewith adapted to be held in position on said floor; a spring-actuated roller fixed in an inclined position corresponding to the incline of said floor, at one side of said vessel, somewhat lower than the top of said vessel; supporting rails or shoulders affixed one on each side of said vessel and somewhat higher than its top, at right angles with said roller; a depression in each of said rails at its extremity opposite from said roller and beyond the top of said vessel, deep enough to reach below the top of said vessel; a side to each of said depressions next said vessel, at right angles with the top of said rails; a flexible blanket somewhat wider than the top of said vessel and long enough to reach from said roller across the top of said vessel, affixed at one extremity to said roller and adapted to be kept normally, wound thereon; a rod somewhat longer than the space between said supporting-rails, attached to said blanket across its other extremity, adapted to rest its ends upon said supporting-rails and slide upon them and carry the end of said blanket over the top of said vessel when same is drawn forward, and adapted to drop its ends into the depressions aforesaid lower than the top of said vessel and bring said blanket down upon the top of same, when drawn forward beyond the extremity of said supporting-rails; all in combination with means adapted to draw said rod and attached blanket off from said roller along said supporting-rails and into said depressions when desired.



2. In a commode, a box larger and deeper than the vessel used in same; a floor in said box, arranged to incline from the front downward to the back; shoulders upon said floor to hold said vessel in place; a spring-actuated roller pivoted at one side of said box lower than the top of said vessel and inclined parallel with the incline of said floor; supports attached to the inside of said box at right angles with said roller one upon each side of same in position higher than the top of said vessel, one being higher than the other corresponding to the incline of said floor; notches or depressions in said supports near the side of box opposite said roller deeper than the level of top of said vessel; a rod or bar reaching across said box and resting its ends on said supports and adapted to slide upon same from near said roller to said depressions and drop into same when drawn forward; rings upon front of said rod, one near each end; a perforation in the side of said box opposite to each ring in front of said rod or bar; a cord crossing the side of said box outside passing through each of said perforations and thence to said bar and through said rings in front of same and connected together between said rings; in combination with a vessel suitable for said purpose, and a flexible blanket narrower than the distance between said supports attached to sides of box, connected with said roller at one end and adapted normally to be kept wound thereon, and connected at its other end with said rod or bar resting on said supports, and adapted to be unwound from said roller as said rod or bar is drawn toward the opposite side of box, carried by same over the top of said vessel and when said rod drops into the depressions in said supports to be let down upon the top of said vessel; all substantially as described.

3. In a commode, a receptacle for the vessel having an inclined floor the highest part of which is at the front of same; a spring-actuated roller pivoted upon one side of said receptacle in an inclined position corresponding to the incline of said floor; a flexible blanket adapted to be held when in normal position wound upon said roller; means for supporting the loose end of said blanket higher than the top of the vessel resting upon said inclined floor when it is unrolled and drawn forward over said vessel; means for dropping said blanket down closely upon the top of said vessel when so unwound from said roller and drawn over said vessel; means for drawing said blanket forward over said vessel from outside of said commode; means for holding said blanket in place upon the top of said

vessel when so drawn forward and dropped down, until released; a vessel suitable to be used in said commode; means for keeping said vessel in position upon said inclined floor; a lid perforated for a "seat" hinged upon the top of said box; a second lid hinged to said first-described lid and adapted to shut down closely upon it; a pin or knob attached to the outside of said commode near the bottom of each side; a strap attached at its ends to the front of said commode and adapted to pass around and support the top lid when thrown back upon its hinges, and when said lid is closed, adapted to be hooked around or under said pins or knobs so as to serve for a bail or handle for carrying said commode; all in combination, substantially as described and for the purpose alleged.

4. In a commode, a close box; an inclined floor in said box; a vessel held in position upon said inclined floor; means for holding same in position; a flexible blanket wider than said vessel, normally held in position at one side of said vessel; means for supporting and carrying said blanket over the top of said vessel when desired and dropping same upon the top of said vessel; means for holding said blanket in place tightly upon the top of said vessel; means for carrying said blanket when released back off from the top of said vessel to its normal position; a tube leading from the inside of said box and a flue connected with said inside of said box by said tube; all in combination, substantially as described.

5. In a commode, a close box; a vessel suitable for the purpose contained in said box; means for covering and closing the top of said vessel normally held away from it; a spring-actuated roller adapted to hold said means for covering said vessel in normal position; supports for holding said means higher than the top of said vessel while passing over it; all in combination with means for dropping said covering down upon the top of said vessel after it is drawn over and means for holding same from being drawn back to normal position until released, substantially as described.

6. In a commode, a vessel, a vessel-cover, supports attached to the inner side of commode-box, a rod attached to said vessel-cover adapted to be held by said supports higher than the top of said vessel and to slide upon same, in combination with depressions in said supports adapted to receive the ends of said rod and let said cover drop down upon the top of said vessel, and means for holding said rod from being drawn back over said supports after it has so dropped into said depressions; all substantially as described.

7. In a commode, a vessel, and a flexible blanket-cover for said vessel, normally held away from top of same, in combination with means for carrying said blanket over the top of said vessel and dropping it down upon it, and means for holding said blanket in such position until released, all substantially as set forth.

8. In a commode, a vessel, and a spring-actuated roller pivoted in box of said commode, in combination with a flexible blanket adapted when in normal position to be wound upon said roller, means for unwinding said blanket from said roller when desired, means for carrying same over the top of said vessel, and means for dropping said blanket down upon the top of said vessel and holding same in that position until released, all substantially as set forth.

709,806. **BICYCLE-PEDAL.** JOSEPH A. DREHER, New Orleans, La. Filed Feb. 10, 1902. Serial No. 93,622. (No model.)

Claim.—1. The improved triangular pedal-frame comprising two hubs and three quadrilateral sections formed of thin plate metal, the plane of the end bars of said sections being at a right angle to that of the side bars and engaged with the hubs, and the side bars being secured together flatwise and their edges forming footholds, as shown and described.

2. The improved triangular pedal-frame, formed of hubs provided with peripheral slits or slots and three quadrilateral frame-sections formed of sheet-steel, the end bars of the same being turned at a right angle to the side bars and inserted in the slots of the hubs, and the side bars being riveted together, substantially as shown and described.

3. The improved bicycle-pedal frame, comprising triangular hubs having radial slits at their angles and three frame-sections formed of sheet-steel, the end bars of the same being curved or cut out on the outer side, at the middle of their length, and bent at a right angle to adapt them for insertion in the slits of the hubs, and the side bars of said sections being riveted together and bent outward at their edges to form footholds, substantially as shown and described.

4. The improved pedal comprising triangular hubs having radial slits at their angles, and frame-sections formed of thin sheet metal, in quadrilateral shape, the end bars of the same being provided with projections on their inner sides and twisted or turned, at the middle of their length, at a right angle to the side bars, and their outer edges inserted in the slits of the hubs, the said side bars lying in contact and being serrated and bent outward at their edges to form footholds, substantially as shown and described.

5. The combination, with a pedal-frame, having flaring toothed edges constituting footholds, of a guard consisting of an elastic tube slitted lengthwise whereby the tube is adapted to be clamped on such toothed portions, and to clamp the same by its own elasticity and thus retain its position in use, substantially as shown and described.

709,807. **FOUNTAIN-PEN.** ROBERT B. DIOHR, Kenosha, Wis. Filed June 26, 1902. Serial No. 113,209. (No model.)

Claim.—1. In a pen of the character described, the combination with a barrel or reservoir and a pen-point, of an absorbent material arranged to retard the flow of ink from one to the other, and means for varying the density of said material, for the purpose of regulating the flow of ink, substantially as set forth.

2. In a pen of the character described, the combination with a barrel or reservoir, of a tubular pen-point communicating therewith, absorbent material located therein to retard the flow of ink, and means to vary the density of said material, substantially as set forth.

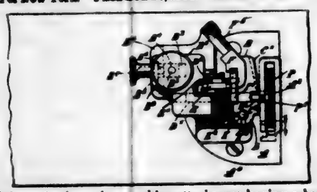
3. In a pen of the character described, the combination with a barrel or reservoir, of a tubular pen-point, absorbent material located therein, a tubular extension projecting from the barrel into the pen-point, and means for sliding the pen-point upon the tubular extension to vary the density of the absorbent material within the pen-point, substantially as set forth.

4. In a pen of the character described, the combination with a barrel or reservoir, of a tubular pen-point, absorbent material located therein, a tubular extension projecting from the barrel into the pen-point, and means for sliding the pen-point upon the tubular extension to vary the density of the absorbent material within the pen-point, said means consisting of a coupling-sleeve loosely connected to the pen-point and having a screw-threaded connection with the barrel or reservoir, substantially as set forth.

5. In a pen of the character described, the combination with an open-ended barrel or reservoir, of a capillary tube removably connected with one end of the barrel or reservoir and open at each end, substantially as set forth.

6. In a pen of the character described, the combination with an open-ended barrel or reservoir provided with a screw-threaded neck, of a capillary tube open at each end and provided with a screw-threaded head to engage the neck, substantially as set forth.

709,808. **SEWING-MACHINE ATTACHMENT FOR OVEREDGE OR BLIND STITCHING.** EDWIN DONALDSON, Brooklyn, N. Y., assignor to International Blind Stitch Company, New York, N. Y., a Corporation of New York. Filed Dec. 26, 1901. Serial No. 87,235. (No model.)



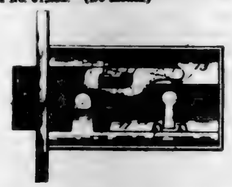
Claim.—1. A sewing-machine attachment having a base, a clamping-screw adapted to secure said base to the bed of the machine, a vertical circular perforation in said base, a cylindrical pin having an upper portion of enlarged horizontal cross-section eccentrically disposed and fitting and rotatable in said perforation and a lower portion centrally disposed and fitting and rotatable in a perforation in the work-plate of the machine, means for locking said pin in the desired position, and a pusher-bar reciprocating to move the edge of the fabrics from under the needle at each alternate descent thereof.

2. A sewing-machine attachment having a base, a clamping-screw adapted to secure said base to the bed of the machine, a vertical circular perforation in said base, a cylindrical pin having an upper portion of enlarged horizontal cross-section eccentrically disposed and fitting and rotatable in said perforation and a lower portion centrally disposed and fitting and rotatable in an elongated perforation in the work-plate of the machine, means for locking said pin in the desired position, and a pusher-bar reciprocating to move the edge of the fabrics from under the needle at each alternate descent thereof.

3. In a sewing-machine a presser-foot on one side of the needle, a pusher-bar on the opposite side of the needle reciprocating to move the edge of the fabrics under said presser-foot and from under the needle at each alternate descent thereof, under said presser-foot, a roughened feeder provided with a recess having a smooth surface opposite, and in proximity, to the end of said pusher-bar, and means for actuating said needle, pusher-bar, and feeder, substantially as and for the purposes described.

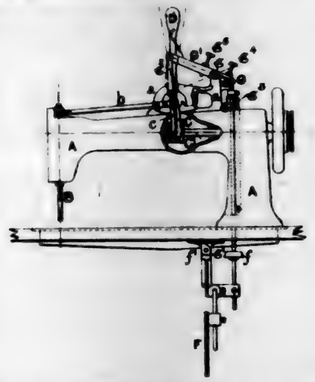
4. In a sewing-machine a presser-foot, on one side of the needle, a pusher-bar reciprocated from the opposite side of the needle to move the edge of the fabrics under said presser-foot and from under the needle at each alternate descent thereof, under said presser-foot, a roughened feeder having an unroughened recess tapered at each end, and having its greatest transverse horizontal and vertical dimensions opposite and in proximity to the end of said pusher-bar, and means for actuating said needle pusher-bar and feeder, substantially as and for the purposes described.

709,809. **LOCK.** HARRY W. ECKER, Meyersdale, Pa. Filed May 21, 1901. Serial No. 61,262. (No model.)



Claim.—The combination of the face-plate, a casing secured thereto, a lining-bar located in the lower part of the casing formed with vertical wards on each side of the keyhole, and an upwardly-projecting extension, a tumbler pivoted to the extension and formed with a longitudinal slot having recesses in its upper edge, and a sliding bolt having downwardly-projecting fingers, and a lug projecting from the bolt and adapted to rest in the edge recesses.

709,810. **NEEDLE-CONTROLLING MECHANISM FOR SEWING-MACHINES.** JOSHUA V. BYRN, Belfast, Ireland. Filed Feb. 7, 1902. Serial No. 93,095. (No model.)



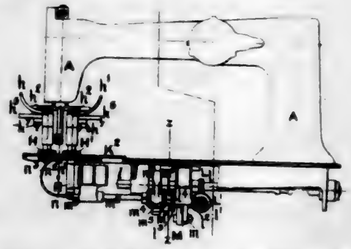
Claim.—1. In needle-controlling mechanism for sewing-machines, the combination of a traversing needle-bar, a radius-lever, a link connected with the needle-bar and radius-lever, a cam for actuating said radius-lever, a second lever having a pivot for the radius-lever and a projection, a spring-actuated notched lever, the notches of which are adapted to be engaged by said projection, and means for changing the position of said link said means including a knee-operated device.

2. In needle-controlling mechanism for sewing-machines, the combination of a traversing needle-bar, a link pivoted to said needle-bar, a radius-lever to which said link is connected, a cam for actuating said radius-lever, a hand-lever having a pivot for said radius-lever and a projection at its lower end, a lever having notches upon its upper side adapted to receive said projection said lever being pivoted at one end to the framing and a coiled spring connected with the other end of said lever.

3. In a needle-controlling mechanism for sewing-machines the combination with the traversing needle-bar B, the radius-lever C by which it is oscillated, a cam such as C' to oscillate the lever, and the link *b* connected to the needle-bar at one end and to the radius-lever at the other end, of a pivoted lever D carrying at its lower end the pivot upon which the radius-lever oscillates, a secondary lever E provided with three notches, a projection d^2 on the lever D to engage the notches in the lever E to determine the position of the center upon which the radius-lever oscillates, a lever G' by which the position of the link *b* can be varied relatively to the radius-lever C, the link g^2 connecting the lever G' with the link *b*, the lever G secured to the spindle of the lever G', the knee-presser F and levers *f f* connected to the lever G by the rod *g'* by which the levers G G' are operated, substantially as described.

4. In needle-controlling mechanism for sewing-machines the combination with the traversing needle-bar B, the radius-lever C by which it is oscillated, a cam such as C' to oscillate the lever, and the link *b* connected to the needle-bar at one end and to the radius-lever at the other end, of a pivoted lever D carrying at its lower end the pivot upon which the radius-lever oscillates, a secondary lever E provided with three notches, a projection d^2 on the lever D to engage the notches in the lever E, the link g^2 connecting the lever G' with the link *b*, the lever G secured to the spindle of the lever G', the knee-presser and levers *f f* connected to the lever G by the rod *g'* by which the levers G G' are operated and feed mechanism by which the work is carried through the machine, substantially as described.

709,811. **FEEDING MECHANISM FOR SEWING-MACHINES.** JOSHUA V. BYRN, Belfast, Ireland. Filed Feb. 7, 1902. Serial No. 93,096. (No model.)



Claim.—1. In a feeding mechanism for sewing-machines, the combination with a traversing needle-bar and means for operating and controlling it, of a circular rotary presser and a spindle to support it, a rotary disk upon which the presser rests and means for rotating them comprising a driving-shaft *l* and worm L thereon, a worm-wheel L' gearing with the worm, a bevel-wheel l' attached to the worm-wheel, a bevel-wheel l^2 gearing therewith and rotating with it, a spur-wheel l^3 rotating with the bevel-wheel l^2, a loose spur-wheel l^4 driven by the spur-wheel l^3, a bevel-wheel m^2 attached to and rotating with the loose spur-wheel l^4, a bevel-wheel m^1 affixed to the shaft m^3 driven from the bevel-wheel m^2 by a carrier-wheel m^4, a shaft m^3 carrying the bevel-wheel m^1 on one end and a worm m^5 on the other end, a frame m^6 pivoted on the shaft m^3 to carry the carrier-wheel m^4 around the bevels m^1 and m^2 when the needle is embedded in the work, the cam m^7 actuating the frame m^6, the worm-wheel m^8 engaging with the worm m^5, the upright shaft N to which the worm-wheel m^8 is fixed, the pinion *n'* on the upper end of the shaft N and the pinion k^2 on the spindle *k'* of the rotary feed-disk K.

2. In a feeding mechanism for sewing-machines, the combination with a traversing needle-bar and means for operating and controlling it, of a circular rotary presser and a spindle to support it, a rotary disk upon which the presser rests and means for rotating them comprising a driving-shaft *l* and worm L thereon, a worm-wheel L' gearing with the worm, a bevel-wheel l' attached to the worm-wheel, a bevel-wheel l^2 gearing therewith and rotating with it, a spur-wheel l^3 rotating with the bevel-

wheel l^2, a loose spur-wheel l^4 driven by the spur-wheel l^2, a bevel-wheel m^3 attached to and rotating with the loose spur-wheel l^4, a bevel-wheel m^4 affixed to the shaft m^5 driven from the bevel-wheel m^3 by a carrier-wheel m^6, a shaft m^7 carrying the bevel-wheel m^4 on one end and a worm m^8 on the other end, a frame m^9 pivoted on the shaft m^7 to carry the carrier-bevel m^6 around the bevels m^3 and m^4 when the needle is embedded in the work, the cam m^{10} actuating the frame m^9, the worm-wheel n engaging with the worm m^8, the upright shaft N to which the worm-wheel m^9 is fixed, the pinion n' on the upper end of the shaft N and the pinion h^6 on the spindle h' of the rotary feed-disk K, and the train of gearing n^2, n^3 and h^5 to drive a second rotary disk K'.

709,812. POLISHING-WHEEL. FRANK G. FARNHAM, Honesdale, Pa. Filed Oct. 26, 1901. Serial No. 80,280. (Model.)

Claim.—1. A ring or section for a polishing-wheel comprising a plurality of projecting bunches, each of said bunches comprising a tube of textile material, substantially as described.

2. A ring or section for a polishing or cleaning wheel consisting of a series of independent projecting bunches, each of said bunches consisting of a folded material sewed near its center to form a tube and free edges, the tube being turned inside out to bring said free edges within the tube to serve as a filler therefor, substantially as described.

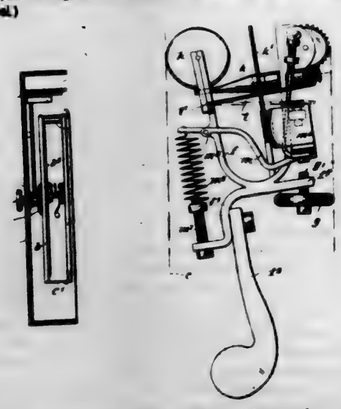
3. A ring or section for a polishing or cleaning wheel comprising a plurality of tubes of textile material secured to a suitable carrier and an independent tube secured separately to each of said main tubes, substantially as described.

4. A ring or section for a polishing-wheel comprising a plurality of tubes of textile material and reinforcing-disks of textile material, substantially as described.

5. A ring or section for a polishing-wheel comprising a plurality of tubes of textile material, said tubes being stitched together, substantially as described.

6. A ring or section for a polishing-wheel comprising a plurality of tubes of textile material and reinforcing-disks of double textile material stitched together, substantially as described.

709,813. SURVEYING INSTRUMENT. THOMAS T. H. PERKINS, Soochow, near Shanghai, China. Filed Nov. 23, 1901. Serial No. 83,389. (No model.)



Claim.—1. In a surveying instrument, the combination of a means forming a flat supporting-surface arranged in a vertical plane, a recorder arranged thereon and adapted to maintain a vertical hanging position, and a device for propelling the recorder over the supporting-surface in a vertical direction, such device being actuated by the jolting of the instrument.

2. In a surveying instrument, the combination of a board forming a support having a plane surface arranged in a vertical plane, a recorder movable vertically over the said surface, and a device for propelling the recorder, said device comprising a poised propelling member driven by the jolting of the instrument.

3. In a surveying instrument, the combination of a member forming opposing supporting-surfaces, a recorder movable between the said surfaces and comprising a marking device, working on one of the surfaces, and a means for driving the recorder, said means being actuated by the jolting of the instrument.

4. In a surveying instrument, the combination of a means forming a supporting-surface, a recorder adapted to move thereon, gearing for driving the recorder, and a poised member connected with the gearing and oscillated by the jolting of the instrument, whereby to impart movement to the gearing.

5. In a surveying instrument, the member having parallel supporting-surfaces, the recorder arranged between the supporting-surfaces and comprising a marking device, and means for driving the recorder, said means being actuated by the jolting of the instrument.

6. In a surveying instrument, the recorder, comprising a marking device, gearing for driving it, and a poised member oscillated by the jolting of the instrument and connected with the gearing to drive it.

7. In a surveying instrument, a recorder comprising a spring frame member, wheels carried by the frame member and adapted to engage opposing supporting-surfaces, and means for driving one of the wheels, said means being actuated by the jolting of the instrument.

8. In a surveying instrument, a recorder having a spring frame member, wheels mounted on the frame member and pressed apart by the spring tendency thereof, the wheels being capable of engaging opposing supporting-surfaces and having their axes parallel with each other, means for driving one of said wheels to move the recorder, said means being actuated by the jolting of the instrument, and an additional wheel mounted on the frame below the first-named wheels and having its axis disposed at right angles to the axes of the first-named wheels.

9. In a surveying instrument, the recorder, comprising a frame, a toothed wheel mounted thereon, a worm meshing with the wheel to drive it, a ratchet engaged with the worm, a swinging bar to drive the ratchet, and a pivoted member connected with the bar and oscillated by the jolting of the instrument.

10. In a surveying instrument, the combination of an adjustably-mounted member forming a support, a recorder arranged thereon and working therewith, and a magnetic needle juxtaposed to said adjustable member to permit moving the adjustable member in coincidence with the movement of the needle.

11. In a surveying instrument, the combination of an adjustably-mounted member forming a support, a recorder arranged thereon and working therewith, means for driving the recorder, such means being actuated by the jolting of the instrument, and a magnetic needle juxtaposed to the movable member to permit of adjusting the said member in accord with the position of the needle.

12. In a surveying instrument, the combination of an adjustably mounted member forming a support, a recorder arranged thereon and working therewith, a magnetic needle, an indicator juxtaposed to the needle, and gearing connecting the indicator and the said adjustably-mounted member.

13. In a surveying instrument, the combination of a box or body member, two boards connected together and spaced apart and adjustably mounted in the box, a recorder movable between the boards, means for moving the recorder, such means being actuated by the jolting of the instrument, and a magnetic needle carried by the box adjacent to the said boards to permit adjusting the boards in accord with the position or positions of the needle.

14. In a surveying instrument, the combination of two boards spaced apart and secured together, means for adjustably mounting the boards, a recorder situated and movable between the boards, and a magnetic needle juxtaposed to the boards to permit adjusting them in accord with the position of the needle.

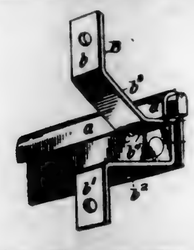
15. In a surveying instrument, the combination with a box or body portion, of a member adjustably mounted thereon, a recorder working with said member, means for driving the recorder, said means being actuated by the jolting of the instrument, an indicator, gearing connecting the indicator with the adjustably-mounted member, and a magnetic needle juxtaposed to the indicator.

16. In a surveying instrument, the combination of a member forming opposing supporting-surfaces, a recorder arranged between the supporting-surfaces and movable over the same, the recorder being adapted to maintain a vertical hanging position, and means actuated by the jarring or jolting of the instrument when carried for moving said recorder.

17. In a surveying instrument, an adjustable supporting member having its supporting-surface adapted to stand in a vertical plane when the instrument is in use, a recorder comprising a marking device coacting with said supporting-surface and adapted to travel vertically over the same, and means actuated by the jolting of the instrument for driving the recorder.

18. In a surveying instrument, a member comprising parallel flat supporting-surfaces, one of which is adapted to be covered with paper, a recorder arranged between the said surfaces and having a spring frame member, the recorder being provided with a toothed marking-wheel, the said recorder being adapted to hang perpendicularly between the said surfaces and to be held in position by frictional contact with the opposing surfaces, and mechanism actuated by the jolting of the instrument for revolving the said wheel to cause the recorder to move vertically between the said surfaces.

709,814. TRACK FOR DOOR-HANGERS. HENRY L. PERRIN, Harvard, Ill., assignor to The Firm of Hunt, Heim, Ferris & Company, Harvard, Ill. Filed Apr. 23, 1902. Serial No. 104,223. (No model.)



Claim.—1. In a device of the class described, the combination with a sheet-metal strip having its upper edge reserved to form a short downwardly-extending portion, the curve thereby forming a track, of a bracket secured to said strip in contact with said short downwardly-projecting portion, substantially as described.

2. In a device of the class described, the combination with an inverted-U-shaped track, of a bracket secured to one of the sides of said track and in contact with the edge of the other side, of said track, substantially as described.

3. In a device of the class described, the combination with a U-shaped track, of a bracket supporting the same, a block in the groove of said track adapted to embrace said bracket, being thereby secured against longitudinal movement with respect to said track, said block being a means of connection between the sections of track, substantially as described.

4. In a device of the class described, the combination with an inverted-U-shaped track having one shorter side, of a bracket secured to the longer side of said U-shaped track and in contact with the edge of the shorter side of said U-shaped track, a block in the groove of said U-shaped track above said bracket, lugs on said block embracing said track and adapted to prevent longitudinal movement of said block and a projecting portion on said block extending from the end of a section of track and adapted to receive the end of a similar section, substantially as described.

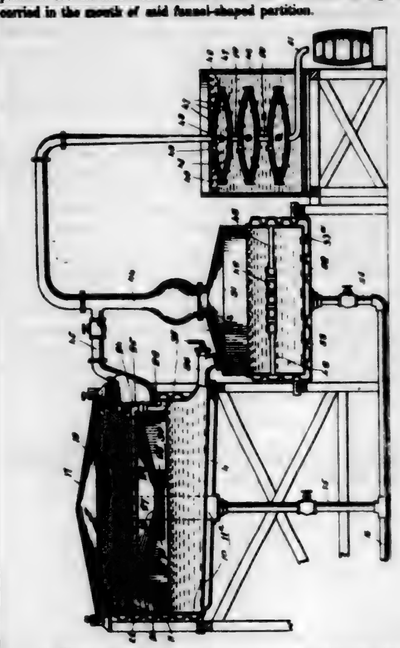
709,815. TURPENTINE-STILL. JOHN T. GILKEY, Mobile, Ala. Filed June 26, 1901. Serial No. 66,126. (No model.)

Claim.—1. A turpentine-still having a gum-vat, means for heating the vat, a strainer in the upper part of the vat, a funnel-like partition arranged below the strainer, and a filter in the mouth of said funnel-like partition, the filter being formed of an absorbent material sandwiched between screens or sieves.

2. The combination of a vat, means for exteriorly heating the same, a horizontal heater-rack or blanket contained in the vat, and comprising upper and lower plates spaced apart and having registering perforations and thimbles secured in the perforations, for the purpose specified, a strainer-basket placed over said rack or blanket and a connection between the interior of the heater-rack and the said means for exteriorly heating the vat.

3. The combination of a vat, means for exteriorly heating the same, a perforate, interiorly-chambered heater-rack or blanket contained in the vat, and a strainer-basket placed over said rack or blanket, and a filter located below the heater-rack or blanket, for the purpose specified.

4. The combination of a vat, means for exteriorly heating the same, a perforate, interiorly-chambered heater-rack or blanket contained in the vat, a strainer-basket placed over said rack or blanket, a funnel-shaped partition located below the blanket or heater-rack, and filtering devices carried in the mouth of said funnel-shaped partition.



5. The combination of a vat, means for exteriorly heating the same, a perforate, interiorly-chambered heater-rack or blanket contained in the vat, a strainer-basket placed over said rack or blanket, the said means for exteriorly heating the vat including a steam-jacket, and connections between said steam-jacket and the chambers of said heater-rack or blanket, the said connections between the steam-jacket and heater-rack including separate pipe-sections and a device for removably holding them engaged.

6. The combination of a vat, means for exteriorly heating the same, a horizontal heater-rack or blanket located in the vat and comprising upper and lower plates spaced apart and having registering perforations, and thimbles secured in the perforations, for the purpose specified, and connections between the said means for exteriorly heating the vat and the interior of the heater-rack or blanket.

7. The combination of a vat, a steam-jacket exteriorly inclosing the same, an interiorly-located, horizontal heater-rack or blanket comprising upper and lower plates spaced apart and having registering perforations, and thimbles secured in the perforations for the purpose specified, and connections between the exterior jacket and the interior of the heater-rack.

8. The combination of a vat, a steam-jacket exteriorly inclosing the same, an interiorly-located, perforate, interiorly-chambered heater-rack or blanket, connections between the exterior jacket and the chamber of the heater-rack, the said connections including two separable pipe-sections, and means for removably holding them engaged.

9. The combination of a vat, means for heating the same, an imperforate partition located therein and having an essentially central passage through it, and a filter held in said passage of the partition and comprising a mass of absorbent material sandwiched between screens or sieves.

10. The herein-described heater-rack or blanket, comprising essentially parallel plates, each plate having portions indented toward the other, said indented portions registering with each other, and thimbles connecting the indented portions together and also forming passages through the rack or blanket.

11. The herein-described heater-rack or blanket, comprising two essentially parallel plates, one of said plates having portions indented toward the other, and thimbles extending through the said indented portions and through the other plate securely to connect said plates together, the thimbles being tubular to serve also to form passages through the rack or blanket.

12. The combination of a vat, a jacket surrounding the outer walls of the vat, said jacket having portions extended toward the walls of the vat, and fastening devices rigidly connecting the indented portions of the

jacket and the walls of the vat together, whereby to form a chamber between the jacket and vat and also to produce a rigid structure.

13. The combination of a vat, a jacket extending around the outer walls thereof, said jacket having a plurality of indented portions projected toward the vat, and fastening devices located in the indented portions of the jacket rigidly to connect said portions with the walls of the vat, the indented portions being removed from each other to permit the free circulation of fluid in all directions around the said fastening devices, for the purpose specified.

14. An apparatus for the manufacture of naval stores, comprising a vat, means for exteriorly heating the same, means for interiorly heating the vat, a strainer-basket located in the vat above said means for interiorly heating the same, a filter located in the vat below said means for interiorly heating the vat, a still, a means establishing communication between the vat and still, means for heating the still, and a condenser connected with the still.

15. An apparatus for the manufacture of naval stores, comprising a vat, means for exteriorly heating the same, means for interiorly heating the vat, a strainer-basket located in the vat above said means for interiorly heating the same, a filter located in the vat below said means for interiorly heating the vat, a still, a means establishing communication between the vat and still, means for heating the still, the said means for heating the still comprising an exterior steam-chamber, an exteriorly-located interiorly-chambered heater-rack, and connections between the heater-rack and the steam-chamber.

709,316. SYSTEM OF ERECTING AND ADJUSTING BRIDGE SUSPENSION-CABLES. WILLIAM J. CLOVER, St. Helens, England. Filed Apr. 29, 1902. Serial No. 105,126. (No model.)

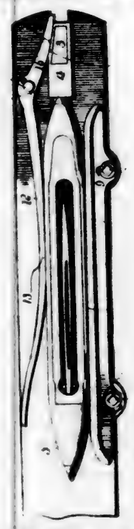
Claim.—1. An apparatus for erecting and adjusting bridge suspension-cables, comprising a length of temporary cable passing over the space to be bridged from one pier to the other, pulleys on the piers and on the suspension-towers over which said temporary cable runs, clamping devices for attaching one end of the suspender-cable to the temporary one, means for driving said cable so that it will act as a traveler and haul the suspender-cable from one pier to the other, and devices for straining up and slacking said temporary cable, whereby the suspender-cable is first placed in position above its correct deflection and can afterward be lowered into position, while at same time any chance of interfering with traffic below is avoided.

2. For erecting and adjusting bridge suspender-cables, a temporary endless cable or traveler passing twice over the space to be bridged, pulleys on the piers and suspension-towers over which the temporary cable can run smoothly, a winch for driving said cable so that it will act as a traveler to draw the permanent cable over from one end, or from opposite ends at the same time, and tension-sheaves and a subsidiary winch for straining up any superfluous cable and making it taut, and for slackening said temporary cable so as to secure any desired deflection.

3. In apparatus for erecting and adjusting bridge suspender-cables, the combination with the traveler of a clamp for securing the suspender-cable thereto, consisting of a pair of cheeks adapted to grip both the cable and the traveler and bolts for binding the two cheeks together, the heads and nuts being in depressions in the cheeks so as not to project beyond the surface of the clamps.

4. In apparatus for erecting and adjusting bridge suspender-cables, the combination with the traveler of clamps V for hanging the suspender-cable (at intervals of twenty yards or so) from the traveler, each consisting of a pair of cheeks adapted to grip the traveler only but loose on the permanent cable so that they can be drawn by the traveler to one pier or the other to be removed, whereby there is no occasion for sending a man across the place to be bridged in cradles to detach the said clamps.

709,317. SHUTTLE-BINDER FOR LOOMS. FREDERICK A. GUILLETTE, WILLIAM J. LYNCH, and HENRY A. GUILLETTE, Taunton, Mass. Filed Nov. 4, 1901. Serial No. 81,067. (No model.)



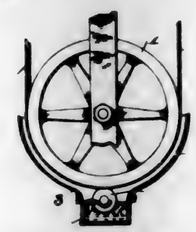
Claim.—1. In a loom attachment, the combination with the lay and the stationary wall of the shuttle-box, of a laterally-swinging binder substantially coextensive in length with the stationary wall and mounted upon a pivot disposed in proximate relation to the transverse plane of the outer end of the latter, the binder being provided intermediate its ends with an elongated swell, and with a member extended from one side of the pivot at an obtuse angle to the main portion of the binder, said member having a contact-surface disposed at an angle to the path of the backward motion of the picker and extending into said path to a point beyond the limit of the outward movement of the picker.

2. In a loom attachment, the combination with the lay and the stationary wall of the shuttle-box, of a pivotally-supported binder forming the movable wall of the shuttle-box, and an auxiliary binder-lever also pivotally mounted, said binder-lever bearing at one end upon the binder and provided at its other end with a short lever-arm extending into the path of movement of the picker.

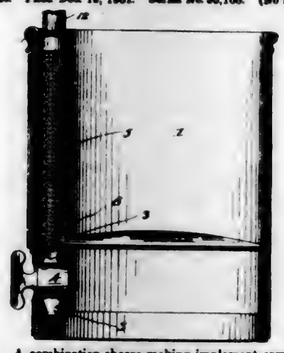
3. In a loom, the combination with the stationary wall of the shuttle-box, of a binder consisting of two pivotally-mounted members, one bearing upon the other and having a lever-arm member extending into the path of motion of the picker, substantially as described.

709,318. LUBRICATOR FOR ELEVATOR-ROPES OR THE LIKE. MARTIN H. HALLORAN, Pittsburg, Pa. Filed Aug. 7, 1901. Serial No. 71,126. (No model.)

Claim.—In a lubricator, the combination with a lubricant-receptacle, of a pair of upwardly and outwardly extending curved guards, formed integral with the opposite ends of the said receptacle, said guards being approximately semicircular in cross-section and adapted to snugly inclose a portion of pulley-wheel, and a roller mounted in the said receptacle, substantially as described.



709,319. COMBINED CURD-KNIFE AND WHEY-STRAINER. LEWIS T. HANKINS, Troy, Ohio, assignor of one-half to Henry M. Case, Toledo, Ohio. Filed Dec. 16, 1901. Serial No. 86,103. (No model.)

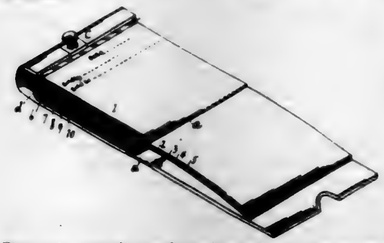


Claim.—1. A combination cheese-making implement comprising a strainer-tube, a stopper for closing the lower end of said tube, and a handle for the stopper to which said stopper is detachably secured, whereby the handle may be released from the stopper and utilized for a different purpose, substantially as described.

2. A combination cheese-making implement comprising a strainer-tube, a stopper for closing the lower end of said tube, and a handle for the stopper to which said stopper is detachably secured, said handle being formed with an edge to serve as a whey-knife, whereby the handle may be released from the stopper and utilized for a different purpose, substantially as described.

3. The combination, with a cheese vat or vessel provided with a port in its bottom for the discharge of the whey; of a strainer-tube having its lower end formed to fit within said port and provided at its upper end with a clasp to engage the upper edge of the wall of the vessel and support the tube in position, a stopper for closing the lower end of said tube, and a handle to which the stopper is detachably connected, substantially as described.

709,320. MANIFOLDING SALES OR COPYING BOOK. PHILIP HAHN, New York, N. Y. Filed Apr. 19, 1902. Serial No. 103,764. (No model.)



Claim.—1. A copying or sales book comprising a number of separate leaves forming a plurality of superposed sections, each section folded upon itself independently of the other sections.

2. A copying or sales book comprising a number of separate leaves arranged in sections, each section folded by itself so as to have its fold separate and distinct from the other sections.

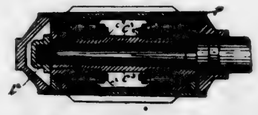
3. A copying or sales book comprising a number of separate leaves each provided with a line of separation, said leaves arranged in series to form sections, each section being folded upon itself independently of the other section, and a carbon or transfer sheet adapted to successively come between the folds of each sheet of the sections.

4. A copying or sales book comprising a number of separate leaves arranged in series to form sections, each section being folded upon itself independently of the other sections, and said sections being adapted to receive carbon-leaves within their folds.

709,321. PROCESS OF SEPARATING SULFONIC ACIDS. LUDWIG O. HELMERS, Hamburg, Germany, assignor to Ichthyol-Gesellschaft Cordes, Hermanni & Co., Hamburg, Germany. Filed Aug. 30, 1901. Serial No. 73,863. (No specimens.)

Claim.—The process of separating sulfonic acids into compounds rich in sulfur and compounds poor in sulfur, which consists in converting the sulfonized products obtained by the action of sulfuric acid upon sulfureted hydrocarbons into salts of organic bases and separating the portions of the salts thus obtained which are soluble in water from the insoluble portions, substantially as and for the purpose set forth.

709,322. ROLLER-BEARING. ALBERT R. HENDERSON, Toronto, Canada, assignor to the Toronto Roller Bearing Company, Limited, Toronto, Canada, a Corporation of Ontario. Filed July 20, 1901. Serial No. 69,151. (No model.)



Claim.—1. An antifriction-bearing, comprising two sets of bearing elements one set of said elements having conical recesses and the other set having projecting tapering mandrels terminating in abruptly-conical points journaled in and of lesser diameters than the conical recesses.

2. In a roller-bearing, the combination of the external sleeve having internal annular flanges, an axle having peripheral flanges, antifriction-rollers contained between the axle and external sleeve, tapering mandrels for the ends of the rollers terminating abruptly in conical ends, bearing-rings loosely encircling the axle having conical recesses of greater diameters than and in which are contained the conical ends of the mandrels, and nuts fitted on the ends of the axle and into the ends of the external sleeve to prevent the outward displacement of the rollers, substantially as set forth.

3. In a roller-bearing, the combination of the external sleeve having internal annular flanges, an axle having peripheral flanges, bearing-rings loosely encircling the axle having conical recesses, bearing-rollers having mandrels terminating abruptly in conical ends journaled in said recesses, said ends being of lesser diameter than the recesses, and nuts fitted on the axle, substantially as set forth.

4. In a roller-bearing, the combination of an external sleeve having internal annular flanges, an internal sleeve having peripheral flanges, antifriction-rollers contained between the internal and external sleeves and prevented from inward displacement by the flanges, bearing-rings loosely encircling the internal sleeve having conical recesses, tapering mandrels for the ends of said rollers having abruptly-terminating conical ends of lesser diameters than the recesses journaled in said recesses, and end nuts to prevent the outward displacement of the rollers.

5. In a roller-bearing, the combination of an external sleeve having internal annular flanges, an internal sleeve mounted on the axle and having peripheral flanges the side faces of the flanges being in the same plane, antifriction-rollers contained between the sleeves prevented from inward displacement by the flanges, bearing-rings loosely encircling the internal sleeve having conical recesses, tapering mandrels for the ends of the rollers terminating in abruptly-conical ends, said ends being journaled in and of lesser diameters than the recesses, and end nuts to prevent the outward displacement of the rollers fitted with inwardly-projecting flanges to form contacting surfaces with the ends of the rollers.

6. In a roller-bearing, the combination of an external sleeve having internal annular flanges, an internal sleeve mounted on the axle and having peripheral flanges, antifriction-rollers with recessed ends contained between the internal and external sleeves, bearing-rings loosely encircling the internal sleeve having conical recesses, tapering mandrels for the ends of the rollers terminating in abruptly-conical ends of lesser diameters

than the recesses and journaled therein, and nuts fitted with inwardly-projecting flanges to form annular recesses in the inner faces of the nuts and contacting surfaces for the ends of the rollers, substantially as specified.

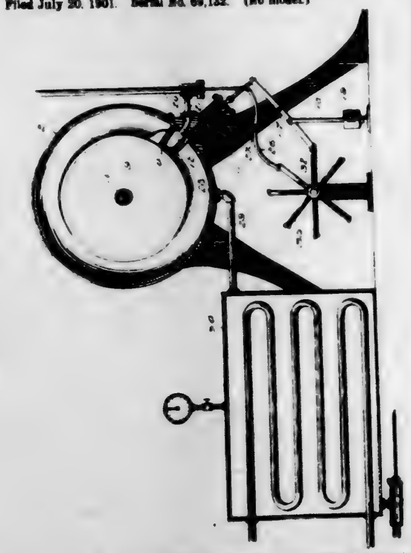
7. In a roller-bearing, the combination of the bearing-rings, bearing-rollers having recessed ends fitted with mandrels journaled in the retaining-rings, an axle having peripheral abutting shoulders, a hub-shell having internal annular abutting shoulders aligning with the annular abutting shoulders of the axle, to prevent the inward displacement of the bearing-rollers and adjustable nuts fitted on the axle and into the ends of the hub-shell having on their inner faces annular flanges to contact with the bearing-rollers, substantially as specified.

8. In a roller-bearing, the combination of a hub-shell having internal annular flanges, an internal sleeve having peripheral flanges, bearing-rings having conical recesses terminating in horizontally-disposed bores, tie-rods uniting the bearing-rings, bearing-rollers having recessed ends fitted with tapering mandrels terminating in abruptly-conical ends journaled in the conical recesses, antifriction-sleeves contained in the hub-shell encircling and contacting the bearing-rollers, antifriction-sleeves mounted on the internal sleeve encircled by and contacting the bearing-rollers, and nuts fitted on the internal sleeve and into the ends of the hub-shell having on their inner faces annular flanges contacting with the ends of the bearing-rollers.

9. The combination of a hub-shell having internal annular flanges an internal sleeve having peripheral flanges, bearing-rings, tie-rods for uniting the bearing-rings, bearing-rollers journaled in the bearing-rings, antifriction-sleeves contained within the hub-shell encircling and contacting the bearing-rollers, antifriction-sleeves mounted on the internal sleeve encircled by and contacting the bearing-rings, and nuts fitted on the internal sleeve and into the ends of the hub-shell having on their inner faces annular flanges contacting with the ends of the bearing-rollers.

10. The combination of the hub-shell having internal annular flanges, an internal sleeve having peripheral flanges, bearing-rings, tie-rods for uniting the bearing-rings, bearing-rollers journaled in the bearing-rings, antifriction-sleeves contained within the hub-shell encircling and contacting the bearing-rollers, separable abutting rings encircling the internal sleeve and prevented from inward displacement by the peripheral flanges, and antifriction-sleeves mounted on the internal sleeve prevented from inward displacement by the abutting rings, substantially as specified.

709,328. ROTARY STEAM-ENGINE. JOHN W. K. HODGE, Blair Station, Pa., assignor of one-fourth to Ewald R. Bahr, Blair Station Pa. Filed July 20, 1901. Serial No. 69,132. (No model.)



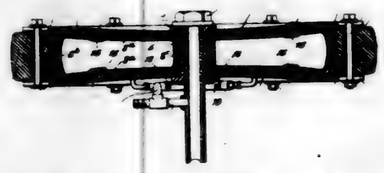
Claim.—1. In a rotary engine, the combination, with a hollow ring having a continuous slot in its inner surface communicating with the interior of the ring; of a disk revolubly mounted in the ring and extending into the slot, a piston projecting from the disk and fitting the interior of the ring, an abutment-casing projecting from the ring, a sliding abutment in said casing, a steam-inlet to the ring, a valve thereto, levers connected to the valve and abutment respectively, a rotary shaft, and a projection thereon adapted to operate the levers of the valve and abutment successively.

2. In a rotary engine, a series of slotted hollow rings, each containing a revolubly disk, pistons upon the disks and fitted in their respective rings, an inlet and an exhaust to each ring, a valve to regulate the flow of steam through the inlets, a sliding abutment in each ring, a revolubly shaft, and a projecting arm thereon for each ring, each arm being adapted to successively operate the abutment and the inlet-valve of its ring.

3. In a rotary engine, the combination with a slotted hollow ring; of a shaft, a disk mounted thereon and revolubly in the slot, a piston upon the disk and mounted in the ring, an inlet-valve and sliding abutment in the ring, a pivoted lever pivoted at one end to the abutment, a pivoted lever pivoted at one end to the inlet-valve, a revolubly shaft driven from the shaft of the disk, and an arm extending therefrom and adapted to successively contact with, and operate, the levers of the abutment and the inlet-valve.

4. A rotary engine comprising a casing formed of a series of similar slotted hollow rings, each of said rings having flanges for the reception of fastening means, whereby the rings are fastened together, a revolubly shaft extending through the rings, disks, secured to the shaft, one disk extending into the slot of each ring, a steam-inlet pipe opening into the ring, a valve to control the entrance of steam through the pipe, a sliding abutment in each ring, a piston upon each disk, said pistons being adapted to work in the rings, a pivoted lever connected to the inlet-valve, a similar lever pivoted to the sliding abutment, a shaft driven from the piston-shaft, and radially-disposed arms thereon at equal angles to each other, each arm being adapted to successively operate the abutment and the inlet-valve of its ring.

709,324. PUNCTURE-PROOF INFLATABLE WHEEL. ALEXANDER HOBRATH, Kiowa, Ind. Ter. Filed May 20, 1902. Serial No. 108,210. (No model.)



Claim.—1. An inflatable wheel comprising a hub, side members rigid with said hub and having peripheral tire-flanges, a tire having its inner edge portion slidably confined between said flanges and movable relatively thereto, and an inflatable pouch or pouches filling the space between the hub and the tire and affording a yieldable cushion for the latter, said tire being seated against the circumferential edge of the pouch or pouches.

2. An inflatable wheel comprising a hub, side members rigid with said hub and provided with peripheral tire-flanges, an elastic solid tire having its inner edge portion slidably and yieldably confined between the flanges of said side members, and an inflatable pouch or pouches filling the space between the tire and the hub and also between the side members, said tire being seated against the circumferential edge of the pouch or pouches which afford a yieldable cushion for the tire.

3. An inflatable wheel comprising a hub, side members rigid with said hub, a tire yieldably held between the peripheral edge portions of the side members, and a series of arcuate inflatable pouches filling the space between the hub and the tire and affording a yieldable cushion for the latter, each pouch having side walls joined by radial end walls and by inner and outer curved walls.

4. An inflatable wheel having a hub, side members attached thereto, a cushion formed by an intermediate pouch or pouches, a tire seated directly on the rim of said cushion and having its inner edge fitted between said side members and fasteners engaging slidably with said side members and confining the tire against radial and lateral displacement relative to said cushion and the side members.

5. An inflatable wheel having side members provided with radial slots, a cushion formed by an inflatable pouch or pouches confined laterally between the side members, a tire seated directly on the rim formed by said cushion, and bolts attached to the tire and fitted slidably in the slots of the side members.

6. An inflatable wheel comprising a hub, side members rigid with said hub, a tire yieldably held between the peripheral edge portions of the side members, and a series of inflatable pouches filling the space between the hub and the tire and affording a yieldable cushion for the latter, said tire being seated against the circumferential edges of the cushions; each pouch being made of yieldable material with radial end walls arranged to meet with similar walls of adjacent pouches, and all the pouches being laterally confined by the side members.

7. An inflatable wheel comprising a hub, side members rigid therewith, a tire yieldably held between said side members, a series of inflatable pouches filling the space between the hub and the tire, and a pressure-distributing means connected individually with the pouches of the series.

8. An inflatable wheel comprising a hub, side members rigid therewith, a tire yieldably confined between the side members, a series of inflatable pouches filling the space between the hub and the tire, and a curved pressure-distributing pipe having individual connection with the pouches, each connection having a check-valve.

9. An inflatable wheel comprising a hub, side members rigid therewith, a tire yieldably confined between the side members, a series of inflatable pouches filling the space between the hub and the tire and said pouches engaging with one another on radial lines of division between them, a pressure distributing pipe having individual connection with the pouches of the series, and means for supplying and inflating medium to said pipe.

10. An inflatable wheel having a series of pouches disposed in abutting relation and confined laterally between anyieldable side plates, a distributing-pipe mounted on one of said plates, and a series of valved branches communicating with the pipe and extending through openings in one side plate and having communication with the pouches.

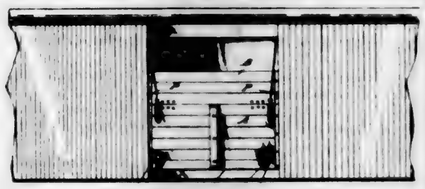
11. An inflatable wheel comprising a hub, side members rigid with said hub, a tire yieldably confined between said members, and a series of inflatable pouches filling the space between the hub and the tire and affording a yieldable cushion for the latter, said pouches having individual interlocking engagement with the side members and sustained laterally thereby.

12. An inflatable wheel comprising a hub, side members rigid with said hub, a tire yieldably confined between the side members, and a series of inflatable pouches filling the space between the hub and the tire and affording a yieldable cushion for the latter, each pouch of the series having at its circumference an interlocking engagement with the inner edge of the tire.

13. An inflatable wheel comprising a hub, side members rigid with said hub, a tire yieldably confined between the side members, and a cushioned body filling the space between the tire and the hub and formed by an inflatable pouch or pouches, said body being laterally confined between the side members and having interlocking engagement with the inner edge of the tire and with the side members.

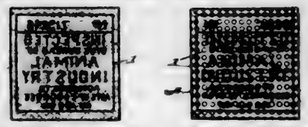
14. An inflatable wheel comprising a hollow axle forming a storage-reservior, a hub on said axle, side members rigid with the hub, a tire yieldably confined between the side members, a cushion-body filling the space between the tire and the hub and laterally confined between the side members, and a pipe attached to the axle and to the cushion-body to establish communication therebetween.

709,325. GRAIN-CAR DOOR. ALONZO L. HOOK, Coffeyville, Kans., assignor of two-thirds to James Robert Hutton, Rosco Kirby Long, and Robert Lincoln Plunkett, Coffeyville, Kans. Filed May 2, 1902. Serial No. 105,634. (No model.)



Claim.—The combination with a car-door adapted to be elevated, means for guiding the door and manually-operated means adapted to be worked for elevating the door, of peculiar guideways for the door and peculiar support for the said elevating means, the said guideways consisting of castings having in addition to means for guiding the door, a groove or socket at their upper ends, and the support for the elevating means consisting of castings having a tongue at their lower ends adapted to enter and fit a socket at the upper end of the lower casting and integral brackets providing support for the winding-shaft, chains leading therefrom with fixed connection to the door and also the means for working said shaft, a ratchet-wheel on the shaft, a lever having pivotal movement on the shaft and carrying a weighted dog having slipping movement from tooth to tooth of the ratchet-wheel, and a fixed pawl operating to hold the shaft as wound, substantially as described.

709,826. LABEL. GEORGE E. HOWARD, Washington, D. C. Filed June 21, 1902. Serial No. 112,667. (No model.)



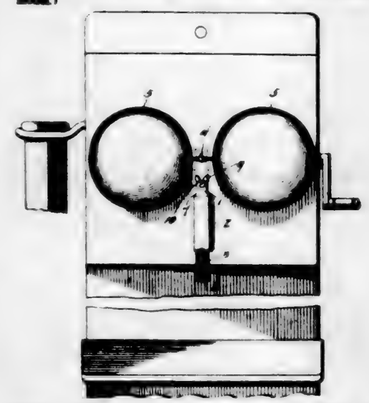
Claim.—1. A label or transfer, comprising a soluble gelatin having the label subject-matter or transfer matter thereon, and a backing of flexible material having perforations, slits or slots formed therein.

2. A label or transfer comprising a medium which consists in soluble gelatin, and an open-work paper backing, the medium having the transfer matter imprinted on one side thereof.

3. A label or transfer, comprising soluble gelatin, and a backing of tissue-paper perforated slitted or slotted, and the medium thus formed carrying the transfer matter thereon.

4. A label or transfer, comprising soluble gelatin and a backing of tissue-paper perforated slitted or slotted, and the medium thus formed carrying the transfer matter on the gelatin side, printed in reverse in transfer-ink.

709,327. TELEPHONE-CALL ANNUNCIATOR. LEREMIAH E. JACKSON, Atchison, Kans. Filed Mar. 8, 1902. Serial No. 97,223. (No model.)



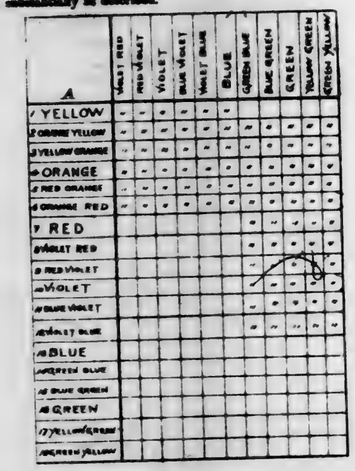
Claim.—A telephone-call annunciator comprising a stationary holder consisting of a closed sleeve-casing having at its longitudinal edges inturned combined guiding and attaching flanges, and also having an imperforate outer side constituting a cover member, and a flat indicator shutter-plate slidably working through the casing and provided at its lower extremity with an offset guard-stop for engagement against the lower end of the casing and contiguous to its upper end with opposite offset arresting stop projections for engagement with the top edge of the casing, the guard-stop and the side arresting-stops being spaced a greater distance apart than the length of the casing, said shutter-plate being further provided at its upper end with engaging means for releasable connection with the call-bell striker, and at its lower end and upon the outer face thereof being provided with a signal adapted to be normally housed and concealed entirely within the closed sleeve-casing behind the outer side or cover thereof, substantially as described.

709,328. COLOR-SCALE. CHARLES J. JORGENSEN, Milwaukee, Wis. Filed Feb. 17, 1902. Serial No. 94,484. (No model.)

Claim.—1. The method of constructing a scale of tertiary colors which consists in first taking the three primary colors yellow, red, and blue and forming the principal secondary colors by mixing them in pairs, and then taking each of said secondary colors in turn and mixing it with the primary lacking in the said secondary color taken and with every other secondary color which contains said lacking primary, substantially as described.

2. In a color-chart, a graduated series of colored figures comprising the secondary colors which can be formed by mixing in pairs the three primary colors, yellow, blue and red and the principal tertiary colors formed by mixing in pairs the said secondary colors, substantially as described.

3. In a color-chart, a series of colored figures arranged in rational sequence and comprising tertiary colors which are formed by taking the three primary colors, yellow, red and blue and mixing them in pairs to form secondary colors, and then taking each of said secondary colors in turn and mixing it with the primary lacking in the said secondary color taken, and with every other secondary color which contains said lacking primary, substantially as described.



709,329. STEEL BOX-CAR. JAMES R. KILBOURNE, Columbus Ohio, assignor to the Kilbourne and Jacobs Manufacturing Company, Columbus, Ohio, a Corporation of Ohio. Filed Jan. 3, 1902. Renewed Aug. 27, 1902. Serial No. 121,174. (No model.)

Claim.—1. A railway-car comprising an open-top body, a bridge extending from end to end thereof, a movable cover and means for moving said cover from one side of the car to the other under the bridge.

2. A railway-car comprising an open-top body, a cover consisting of sections adapted to slide upon each other, and a bridge extending from end to end of the car to form a permanent runway and a housing for the meeting edges of the cover, said cover sliding under the bridge.

3. A railway-car comprising an open-top body, a bridge extending from end to end thereof, a movable cover, an endless belt secured to said cover and means to operate said belt.

4. A railway-car comprising an open-top body, a bridge extending from end to end thereof, a cover consisting of a series of sections each extending from the bridge to a side of the car and movable from side to side beneath said bridge, and plates overlapping the meeting edges of said sections.

5. A railway-car comprising an open-top body, a bridge extending from end to end thereof, a cover consisting of a series of movable sections, an endless belt connected to each of said sections, a guide-plate in which said belts are fitted and a plate overlapping the adjacent edges of the said sections.

6. A railway-car comprising an open car, a bridge extending from end to end thereof, a movable cover adapted to slide under said bridge, an endless belt connected to said cover and means for operating said belt.

709,330. BOX-CAR. JAMES R. KILBOURNE, Columbus, Ohio, assignor to the Kilbourne and Jacobs Manufacturing Company, Columbus, Ohio, a Corporation of Ohio. Filed Jan. 3, 1902. Renewed Aug. 27, 1902. Serial No. 121,175. (No model.)

Claim.—1. A railway-car comprising an open-top body, a bridge extending from end to end thereof, a movable cover for said car extending from said bridge to the side of the car, and means mounted on said bridge for manipulating said cover.

2. A railway-car comprising an open-top body, a bridge extending from end to end thereof, a movable cover for said car extending from said bridge to the side of the car, and means mounted on said bridge for manipulating said cover, said bridge being constructed in the form of a housing for said manipulating means.

3. A railway-car comprising an open-top body, a bridge, a flexible cover, and means on the bridge and on a side of the car for drawing said cover in opposite directions.

4. A railway-car comprising an open-top body, a bridge, a flexible cover, and means on the bridge and on a side of the car for drawing said cover in opposite directions, one of said means rolling the cover.

5. A railway-car comprising an open-top body, a bridge, a flexible cover, and means on the bridge and on a side of the car for drawing said cover in opposite directions, one of said drawing means rolling the cover and the other connected thereto by a flexible connection.

6. A railway-car comprising an open-top body, a bridge, a flexible cover, and means on the bridge and on a side of the car for drawing said cover in opposite directions, consisting of two winding-shafts, one of which is connected directly to and rolls the cover, and the other of which connects therewith through a flexible winding connection.

7. A railway-car comprising an open-top body, a bridge extending from end to end thereof, a flexible cover for said car extending from said bridge to a side of the car, and means on said bridge for winding up said cover.

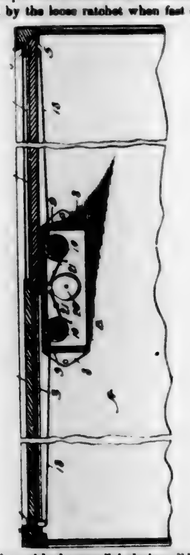
8. A railway-car comprising an open-top body, a bridge extending from end to end thereof, a flexible cover for said car extending from said bridge to a side of the car, and means on the bridge for winding up said cover, and means on a side of the car connected with the cover and drawing it outward.

9. A railway-car comprising an open-top body, a bridge extending from end to end thereof, a flexible cover for said car extending from said bridge to a side of the car, and means on said bridge for winding up said cover, means on a side of the car connected with the cover and drawing it outward, said point of connection being within the edge of the cover, whereby the cover projects beyond the lines of the car.

10. In combination with an open car, a bridge, a flexible cover extending from the bridge to a side of the car, a winding-shaft for the cover, on said bridge, and the housing for said winding-shaft receiving the cover when wound on said shaft.

709,331. SHOW-CASE. WARREN KIRBY, Pike, Ark. Filed May 21, 1902. Serial No. 106,389. (No model.)

Claim.—1. The combination with the closing slide of a show-case, of a casing secured in the show-case, a shaft journaled in the casing, a spool fixed on the shaft, a ratchet mounted loose on the shaft, a second ratchet fixed on the shaft, a pawl on the loose ratchet to engage the fast ratchet and lock the first-named ratchet to the shaft in one direction, a coil-spring to rotate the shaft, an extensible and retractable cord having one end secured to the spool and the other end secured to the slide, a bell, and a clapper actuated by the loose ratchet when fast on the shaft.



2. The combination with the parallel closing slides of a show-case, of a casing mounted in the casing, duplicate shafts journaled in the casing, a spool fixedly secured on each shaft, cords extending from the spools to the outer ends of the slides, combined disks and ratchets loosely mounted on the shafts, a ratchet fixed on the shafts, pawls on the disks to engage the fixed ratchets, springs to actuate the shafts, a bell interposed between the shafts and the mechanisms, and clappers actuated by the loose ratchets, substantially as described.

709,332. FOLDING STRETCHER OR COT. JOHN H. KOONS, Lehighton, Pa., assignor of one-half to Henry Schwartz, Lehighton, Pa. Filed Mar. 14, 1902. Serial No. 98,185. (No model.)

Claim.—1. A folding stretcher, cot or like article, comprising side rails, a flexible cover secured to the side rails, cross-bars made in sections hinged together and pivoted to the side rails, legs hinged on the side rails, and links connecting the cross-bars with the said legs, to swing the latter into a closed position on moving the rails toward each other to fold the device, and to swing the legs into an angular active position on moving the rails apart, as set forth.

2. A folding stretcher, cot or like article, comprising side rails, a flexible cover secured to the side rails, cross-bars for connecting the side rails with each other, each cross-bar being made in sections pivoted together and to the side rails by vertical pivots, legs hinged to the side rails, and sectional links, each pivoted to a leg by a horizontal pivot and to a section of the cross-bar by a vertical pivot, as set forth.

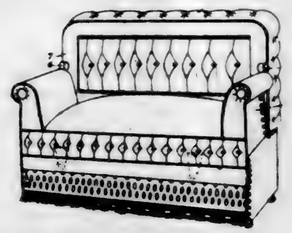
3. A folding stretcher, cot or like article, comprising side rails, a flexible cover secured to the side rails, cross-bars for connecting the side rails with each other, each cross-bar being made in sections pivoted together and to the side rails by vertical pivots, legs hinged to the side rails, and sectional links, each connecting a leg with a section of the cross-bar, each link being made of three sections connected with each other by hinges and pivoted to the cross-bar sections by vertical pivots and to the legs by horizontal pivots, as set forth.

4. A folding stretcher, cot or like article, comprising side rails, a flexible cover secured to the side rails, cross-bars for connecting the side rails with each other, each cross-bar being made in sections pivoted together and to the side rails by vertical pivots, legs hinged to the side rails, sectional and pivoted links, each link being pivoted to a leg by a horizontal pivot and to a section of the cross-bar by a vertical pivot, and a locking device for each cross-bar, to lock the sections thereof in an extended position, as set forth.

5. A folding stretcher, cot or like article, comprising side rails, a flexible cover secured to the side rails, cross-bars for connecting the side rails with each other, each cross-bar being made in sections pivoted together and to the side rails by vertical pivots, legs hinged to the side rails, sectional links pivoted together by pivots at right angles to each other, each link being pivoted to a leg by a horizontal pivot and to a section of the cross-bar by a vertical pivot, and a locking device for each cross-bar, to lock the sections thereof in an extended position, each locking device consisting of a bar fastened to one section and having means at its free end to engage the other section of the cross-bar to lock the sections in alinement, as set forth.

6. In a folding stretcher, cot or the like, the combination with side rails having openings therein and legs pivoted to the side rails adjacent to the openings thereof and provided with an opening near its pivoted end, of sectional and hinged cross-bars pivoted at their ends to the side bars, one section of said bars being provided with an opening, a bar secured at one end to one of the sections of each of the cross-bars and provided at its free end with a catch adapted to enter the opening in the other section when the sections are in alinement and to enter the openings of the legs and side rails when the device is folded, and links pivoted to the cross-bars and to the legs, as set forth.

709,333. CONVERTIBLE BED AND SOFA OR CHAIR. LOUIS KRAEMER, San Francisco, Cal. Filed Nov. 25, 1901. Serial No. 83,510. (No model.)



Claim.—1. In a convertible bed and sofa or chair, the combination of a suitable support, a seat resting thereon when used as a sofa or chair and hinged upon the front side of the support and swinging forward to form a bed, said seat being provided with suitable means for supporting the same in a horizontal position when so swinging forward and a back pivoted on the rear side of the support and hinged to swing forward and rest upon the support to form a bed, said back having an extension below the surface upon which the seat rests, said extension having hinged thereto a rear piece which swings outward in forming the bed, substantially as described.

2. In a convertible bed and sofa or chair, the combination of a suit-

able support, a seat resting upon said support when used as a sofa and hinged upon the front side of the support and swinging forward to form a bed, said seat being provided with means for supporting the same in a horizontal position when so swung forward, a back hinged upon the rear side of the support and having an extension depending below the support upon which the seat rests, said support having ends which are extended behind said hinges and past the sides of said extension of the back, substantially as described.

3. In a convertible bed and sofa or chair, the combination of a box, a seat hinged upon the front side of the box and swinging forward to form a bed, said seat having arms serving as supports therefor when so overturned, a back pivoted on the rear side of the box, the upper portion of the back being arranged to swing forwardly and rest upon the top of the box, and the lower portion of the back swinging rearwardly and upward, and brackets hinged to said box and swinging outward to support said lower portion of the back when raised, substantially as described.

4. In a convertible bed and sofa or chair, the combination of a suitable support, a seat resting upon said support when used as a sofa and hinged upon the front side of the support and swinging forward to form a bed, said seat being provided with suitable means for supporting the same in a horizontal position when so swung forward and having a mattress on its under side, and a pivoted back having an extension below its pivot said back being pivoted on the rear side of the support, the upper portion thereof swinging forward to rest upon the support in the place of the seat, and the extension swinging rearward and upward and projecting rearwardly or outwardly beyond said support when said back is so swung forward and downward, said back and extension having a mattress on the rear side, substantially as described.

5. In a convertible bed and sofa or chair, the combination of two main sections, one section comprising a seat, and the other section comprising a back and an extension below the pivotal point of said back, a suitable support upon which said seat and back are hinged to swing forward to form a bed, said seat and back having mattresses on their under sides respectively, and one of said sections having a supplementary piece hinged thereto to form an extension of said section, said supplementary piece having also a mattress on the upper side when so extended, substantially as described.

6. In a convertible bed and sofa or chair, the combination of a suitable support, a seat resting thereon to form a sofa or chair, hinged upon the front side of the support and swinging forward to form a bed, said seat being provided with suitable means for supporting the same in a horizontal position when so swung forward, and a back pivoted on the rear side of the support, the upper portion of the back swinging forwardly and resting upon the top of the support to form a bed, said back having an extension below the surface of the support upon which the seat rests, said extension swinging upward and rearwardly to form a bed and a supporting device movable independently of said pivotal connection and arranged to be moved beneath said extension when so swung upward and rearwardly to support the same, substantially as described.

709,384. LEAD FUSE FOR ELECTRIC CIRCUITS. FREDERICK H. KRESS, Copenhagen, Denmark. Filed Oct. 26, 1901. Serial No. 79,953. (No model.)

Claim.—1. A lead fuse-plug for electrical plants, comprising a hollow body provided in its lower end with a hole of conical shape, a lead wire provided with a contact-plate and adapted to be inserted in said body through said conical opening, the upper end of the wire being arranged for connection with a copper contact, as set forth.

2. A lead fuse-plug for electrical plants, comprising a hollow body having a conical-shaped opening in its lower end, a lead wire adapted to be inserted through said opening, and arranged for connection at its upper end with a copper contact, and a contact-plate connected with the lower end of the said wire and provided with hooks adapted to be fastened to the body by a bayonet-joint, as set forth.

3. A lead fuse-plug for electrical plants, comprising a hollow body having a conical-shaped opening in its lower end, the diameter of the opening at its inner or apex end corresponding to the predetermined diameter of the wire required for the purposes of the plug, thereby preventing the insertion of a wire of greater diameter, and a lead wire provided at one end with a contact-plate and adapted to be inserted in said plug through said opening, the other end of the wire being arranged for connection with a copper contact, as set forth.

4. As an article of manufacture, a fuse-plug for electrical apparatus, comprising a goblet-shaped insulating member provided with a small aperture, a metallic jacket secured upon said goblet-shaped member, a disk provided centrally with a fuse-wire for passing through said aperture and provided circumferentially with anchors, and means for securing said anchors upon said goblet-shaped member.

5. As an article of manufacture, a fuse-plug for electrical apparatus, comprising a hollow insulating member provided with an aperture of arbitrary size, and means located adjacent to said aperture for the purpose of engaging the ends of a fuse-wire passing through said aperture, the said arbitrary size of said aperture being such as to exclude the passage of fuse-wires exceeding a certain size.

6. As an article of manufacture, a fuse-plug for electrical apparatus, comprising a hollow insulating member provided with openings and with a passage of arbitrary area in cross-section, and means adjacent to said passage for engaging the ends of a fuse-wire to be threaded through said passage, the said passage constituting a wire-gage and preventing the admission of undesirably large fuse-wires.

7. As an article of manufacture, a fuse-plug for electrical apparatus, comprising an insulating member provided with openings, and also provided with a narrow passage constituting a wire-gage, and means for connecting a fuse-wire so that the latter will pass through said gage.

8. As an article of manufacture, a fuse-plug for electrical apparatus, comprising an insulating-section provided with a conical opening and with one member of a bayonet-joint, a disk provided with the other member of said bayonet-joint, and also provided with a fuse-wire having a conical portion, a metallic contact secured upon said insulating-section, and means for securing said fuse-wire to said section.

9. As an article of manufacture, a fuse-plug for electrical apparatus comprising a hollow insulating member provided with a conical-shaped passage constituting a wire-gage, and means for connecting a fuse-wire so that the latter will pass through said gage.

10. As an article of manufacture a fuse-plug for electrical apparatus, comprising an insulating member provided with a conical-shaped aperture, the opening at the inner or apex end of the aperture being of arbitrary size, and means for engaging the ends of the fuse-wire passing through said aperture.

11. As an article of manufacture, a fuse-plug for electrical apparatus comprising an insulating-section having an opening for the passage of the fusible wire, the said section being provided with one member of a bayonet-joint, and a contact-plate carrying the fusible wire and provided with hooks forming the other member of the bayonet-joints.

12. As an article of manufacture a fuse-plug for electrical apparatus, comprising an insulating member provided with a conical opening and having one member of a bayonet-joint, a contact-disk provided with hooks constituting the other member of the bayonet-joint, and a fuse-wire connected at one end with said disk and adapted to pass through the said conical opening.

709,385. PNEUMATIC TORPEDO-FIRING APPARATUS. SIMON LAKE, Bridgeport, Conn. Filed Jan. 30, 1902. Serial No. 91,871. (No model.)

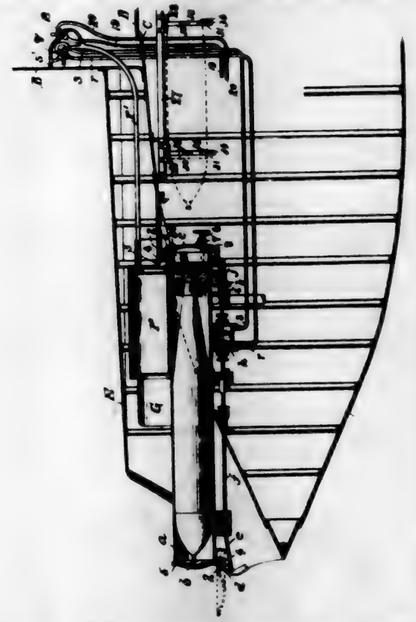
Claim.—1. In combination, a submarine boat provided with a conning-tower rising above the hull of the same and normally separated therefrom by a water-tight wall or partition and a torpedo-tube, a compressed-air reservoir and a connection therefrom to the inner end of said torpedo-tube, and devices controlled by means within the conning-tower for admitting compressed air to the torpedo-tube for expelling a torpedo therefrom.

2. In combination, a submarine boat provided with a conning-tower disposed upon the exterior of and wholly above the hull of the same and normally separated therefrom by a water-tight wall or partition and a torpedo-tube, a compressed-air reservoir and a connection therefrom to the inner end of said torpedo-tube, and devices controlled by means within the conning-tower for admitting compressed air to the torpedo-tube for expelling a torpedo therefrom.

3. In combination, a submarine boat provided with a conning-tower rising above the hull of the same and a torpedo-tube, a compressed-air reservoir, a pipe connection from said compressed-air reservoir to the inner end of said torpedo-tube, a valve in said pipe connection, a motor the movable member of which is connected to said valve, and means within the conning-tower for controlling the operation of said motor for actuating the said valve.

4. In combination, a submarine boat provided with a conning-tower rising above the hull of the same and a torpedo-tube, a compressed-air reservoir, a pipe connection from said compressed-air reservoir to the inner end of said torpedo-tube, a valve in said pipe connection, a cylinder, a piston within said cylinder provided with a suitable connection with said valve, and means within the conning-tower for effecting the movement of said piston to actuate the said valve.

5. In combination, a submarine boat provided with a conning-tower rising above the hull of the same and a torpedo-tube, inboard and outboard caps for said torpedo-tube, mechanism for opening the outboard cap from within the boat, means connected with or applied to the inner end of said torpedo-tube to provide expulsive power for ejecting a torpedo, means within the conning-tower for operating the mechanism for opening the outboard cap of said torpedo-tube, and means also controlled from within the conning-tower for effecting the expulsion of the torpedo.



6. In combination, a submarine boat provided with a conning-tower rising above the hull of the same and a torpedo-tube, inboard and outboard caps for said torpedo-tube, mechanism for opening the outboard cap from within the boat comprising a cylinder and actuating-piston contained therein and connected with said mechanism, a compressed-air reservoir, a pipe connection from said compressed-air reservoir to the inner end of said torpedo-tube, a valve in said pipe connection, a second cylinder and actuating-piston contained therein and connected with said valve, and devices within the conning-tower for successively operating the said pistons to first open the outboard cap and thereafter open the valve in the said pipe connection for effecting the expulsion of the torpedo from said tube.

7. In combination, a submarine boat provided with a conning-tower rising above the hull of the same, a torpedo-tube, inboard and outboard caps for said torpedo-tube, mechanism for opening said outboard cap from within the boat, a stop device controlled by the inboard cap for locking the outboard cap in its closed position while the inboard cap is open, a compressed-air reservoir, a pipe connection from said compressed-air reservoir to the inner end of the torpedo-tube, air-cylinders containing actuating-pistons connected, respectively, with a valve in said pipe connection and said mechanism for opening the outboard cap, and means within the conning-tower for successively admitting air to said air-cylinders to first open the outboard cap and then actuate said valve to admit air to the torpedo-tube to expel a contained torpedo.

8. In combination, a submarine boat provided with a conning-tower rising above the hull of the same, a torpedo-tube, inboard and outboard caps for said torpedo-tube, mechanism for opening said outboard cap from within the boat, a stop device for preventing the operation of said mechanism while the inboard cap is open, a locking device normally engaging a torpedo within said tube provided with means for causing it to release said torpedo at a predetermined air-pressure in said tube, an air-reservoir, a valved connection from said air-reservoir to the inner end of the torpedo-tube, and means within the conning-tower for first actuating the outboard-cap-opening mechanism and then admitting air to the torpedo-tube for expelling the contained torpedo.

9. In combination, a submarine boat provided with a conning-tower rising above the hull of the same, a torpedo-tube, inboard and outboard caps for said torpedo-tube, a locking device normally engaging a torpedo within said tube provided with means for causing it to release said torpedo only at a predetermined minimum air-pressure within said tube, mechanism for opening said outboard cap from within the boat including a stop for preventing the releasing operation of said torpedo-locking device during the opening of said outboard cap, an air-reservoir, a valved connection from said air-reservoir to the inner end of the torpedo-tube, and means within the conning-tower for first actuating the outboard-cap-opening mechanism and then admitting air to the torpedo-tube for expelling the contained torpedo.

10. In a torpedo-boat, the combination with a torpedo-tube and outboard and inboard caps therefor, of means for preventing the opening of one of said caps while the other remains open.

11. In a torpedo-boat, the combination with a torpedo-tube and outboard and inboard caps therefor, of pneumatic apparatus for opening said outboard cap, and a stop device for preventing the operation of said apparatus to open said outboard cap while the inboard cap remains open.

12. In a torpedo-boat, the combination with a torpedo-tube and outboard and inboard caps therefor hinged thereto, a rod supported in bearings adjacent to said tube connected with said outboard cap and provided with means for moving the same to and fro for opening and closing said outboard cap, a stop device serving to normally lock said rod from movement while the inboard cap is open, and a device intermediate said inboard cap and the locking device whereby the latter is caused to release said rod to permit the opening of the outboard cap.

13. In a torpedo-boat, the combination with a torpedo-tube and outboard and inboard caps therefor, of an actuating-rod disposed parallel with said tube and connected with said outboard cap, and means for moving said rod to and fro for opening and closing said outboard cap, a locking device consisting of a transversely-movable plug normally projected into the path of movement of said actuating-rod, and a retracting device for said plug normally projecting into the path of said inboard cap and operated when the latter is closed to withdraw the said plug from the path of movement of said actuating-rod.

14. In a torpedo-boat, the combination with a torpedo-tube and hinged outboard and inboard caps for the same, of an actuating-rod connected with said outboard cap and disposed parallel with said tube, means for moving said rod to and fro to open and close said outboard cap, and a locking device for preventing the movement of said rod while the inboard cap is open, the same consisting of a socket-piece attached to the torpedo-tube and provided with a stop-plug having its projecting outer end normally lying in the path of said actuating-rod and closely adjacent to the end of the same, and beveled with an upward and backward incline, and a tappet-rod interposed between the beveled end of said plug and the path of movement of the inboard cap upon its hinge, whereby the closing of said inboard cap upon the end of said tappet-rod causes the withdrawal of said locking-plug from the path of movement of said actuating-rod to permit the opening of the outboard cap.

15. In a torpedo-boat, the combination with a torpedo-tube, of a cap for closing one end of the same, a hinge for said cap, a rigid seat formed upon or attached to said tube, an elastic or yielding packing interposed between said hinge and its seat, means for securing said hinge to its seat, and an elastic or yielding packing interposed between the end of said tube and its cap.

16. In a torpedo-boat, the combination with a torpedo-tube, of a cap for closing one end of the same, a hinge for said cap, a rigid seat formed upon or attached to said tube, an elastic or yielding packing interposed between said hinge and its seat, an elastic or yielding packing interposed between the end of said tube and its cap, and means for maintaining the said cap pressed to its seat upon the end of said tube.

17. In a torpedo-boat, the combination with a torpedo-tube, of a removable cap for closing one end of the same having a curved external seat, a packing interposed between said cap and the end of said torpedo-tube, and a yoke having arranged concentrically with said curved external seat a transverse pivotal connection with said tube and adapted to engage the external seat of said cap.

18. In a torpedo-boat, the combination with a torpedo-tube, of a removable cap for closing one end of the same having a curved external seat, a packing interposed between said cap and the end of said torpedo-tube, a yoke having arranged concentrically with said curved external seat a transverse pivotal connection with said tube and adapted to swing across the end thereof provided with said cap, and a clamp-screw carried by said yoke and adapted to engage the external seat of said cap.

19. In a torpedo-boat, the combination with a torpedo-tube, of a locking device for normally engaging a torpedo housed in said tube, and means actuated by a predetermined minimum pressure within said torpedo-tube for disengaging said locking device from the torpedo.

20. In a torpedo-boat, the combination with a torpedo-tube, of a locking-pin for normally engaging an external shoulder of a torpedo contained within said tube, a cylinder communicating with the interior of said torpedo-tube, and a piston within said cylinder and connected with said lock-

ing-pin to withdraw the latter at a predetermined minimum pressure within said torpedo-tube.

21. In a torpedo-boat, the combination with a torpedo-tube having a removable outboard or muzzle cap, of a locking-pin for normally engaging an external shoulder upon a torpedo contained within said tube, a cylinder communicating with the interior of said torpedo-tube, a piston within said cylinder connected with said locking-pin, and a stop device connected with said outboard cap and so constructed and arranged as to maintain the torpedo-locking device in operative position between the extreme open and closed positions of said outboard cap.

22. In a torpedo-boat, the combination with a torpedo-tube, and a compressed-air reservoir, of a pipe connection from said air-reservoir to the inner end of said torpedo-tube, a valve in said pipe connection, a cylinder, a piston within said cylinder having its rod operatively connected with said valve, and means for supplying motive power to said cylinder for actuating said piston to operate the said valve.

23. In a torpedo-boat, the combination with a torpedo-tube, and a compressed-air reservoir, of a pipe connection between said compressed-air reservoir and torpedo-tube, a gate-valve in said pipe connection, an air-cylinder disposed axially in line with said gate-valve and having a piston whose rod is directly connected with the stem of said gate-valve, and means for supplying compressed air for actuating said piston to open and close said gate-valve.

24. In a torpedo-boat, the combination with a torpedo-tube and a removable outboard cap therefor, of a power-operated device for opening and closing said cap, and a manual locking device for preventing the actuation of said power-operated device to open said cap, when desired.

25. In a torpedo-boat, the combination with a torpedo-tube and a removable outboard cap therefor, of a rod connected with said cap and extended within said boat, a stationary inboard bearing to which the inner portion of said rod is slidably fitted, and a longitudinally-movable thrust-collar upon said rod adapted to engage said inboard bearing for preventing the movement of said rod.

26. In a torpedo-boat, the combination with a torpedo-tube and a removable inboard cap therefor, of an overhead rail or track disposed in the vertical plane of and parallel with the axis of said tube, and torpedo-carrying slings depending therefrom.

27. In a torpedo-boat, the combination with a torpedo-tube and a removable inboard cap therefor, of an overhead rail or track disposed in the vertical plane of and parallel with the axis of said tube, carriages mounted upon said track, and torpedo-carrying slings removably attached to and depending from said carriages.

28. In a torpedo-boat, the combination with a torpedo-tube and a removable inboard cap therefor, of an overhead rail or track disposed in the vertical plane of and parallel with the axis of said tube, carriages mounted upon said rail or track, and torpedo-carrying slings removably attached to and depending from said carriages, said slings being formed each in two separable semi-annular sections united at the opposed ends by means of pivotal pins and by a clamp-bolt, respectively, and adapted to be separated for the reception of a torpedo.

29. In a torpedo-boat, the combination with a torpedo-tube and a removable inboard cap therefor, of an overhead rail or track disposed in the vertical plane of and parallel with the axis of said tube, carriages mounted upon said rail or track, and torpedo-carrying slings attached to and depending from said carriages, said slings being formed each in two semi-annular sections 30 having the opposed ends connected at the point of suspension to the carriage, through which they are united together, by means of removable pivotal pins 36 and clamp-bolt 35, and at the opposite point of connection by means of a clamp-bolt 32, each section being also provided with a suspension-eye 33.

30. In a torpedo-boat, the combination with a torpedo-tube having removable inboard and outboard caps, of a compressed-air reservoir, a valved pipe connection therefrom to the breech end of said torpedo-tube, and a valved pipe connection from said tube to the exterior of the boat.

709,886. TROUGH FOR SILVERING GLASS. CONSTANT LAVAL, Pittsburg, Pa. Filed May 9, 1902. Serial No. 106,634. (No model.)

Claim.—1. A device for silvering glass consisting of a trough having an inclined bottom and its inner face coated with an impermeable substance.

2. A trough consisting of a single piece of suitable material hollowed out and having a contracted discharge end, and a lining therefor of an impermeable substance.

3. A trough consisting of a single piece of suitable material hollowed out and having a contracted discharge end, and a lining of rubber therefor.

4. A device for silvering glass consisting of a trough having a contracted open end, and a lining therefor of an impermeable substance.

5. A device for silvering glass consisting of a trough having a contracted open end, and a rubber lining therefor.

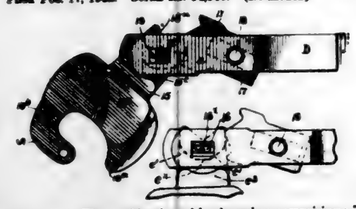
6. A device for silvering glass consisting of a single piece of material hollowed out to form a trough with an inclined bottom and a closed and an open end, and a lining of an impermeable material therefor.

7. A device for silvering glass consisting of a single piece of material hollowed out to form a trough with an inclined bottom and a closed and an open end, and a lining of rubber therefor.

709,887. PENCIL-CASE. WILLIAM A. LEARY, Washington, D. C. Filed Apr. 21, 1902. Serial No. 104,071. (No model.)

Claim.—A pencil-holder comprising an elongated cylindrical body portion having one end adapted to receive a lead-pencil, the other end being extended to form a flat, integral cutting-blade which is reduced near its inner end to form rear cutting-shoulders, said blade being crimped longitudinally to form a strengthening-rib, as set forth.

709,888. CAR-COUPLING. WATSON S. LEMON, Tucson, Ariz. Filed Feb. 17, 1902. Serial No. 94,519. (No model.)



Claim.—1. The combination with a draw-bar, comprising a ⊐-shaped strap, a bearing-block, held between the ends thereof, and having yielding movement lengthwise thereof; of a draw-head having a shank, said shank and the bearing-block having pivotal coacting bearing-surfaces, and means for detachably connecting the draw-head shank with the ends of the ⊐-shaped draw-bar, as and for the purposes shown and described.

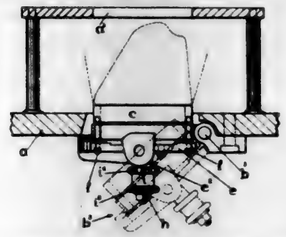
2. The combination with the draw-head, having a shank terminating in a <-shaped bearing end, said shank also having a coöperating pivot-stud on the upper and under sides, transversely-disposed bearing-shoulders, and angle shoulders on the said upper and under sides; of a ⊐-shaped draw-bar, having slotted ends to engage the pivot-studs on the draw-bar shank, and having transverse bearing-surfaces to engage the transverse and angle bearing-surfaces on the aforesaid shank, and the spring-held bearing-block mounted within the draw-bar members, said block having a ⋛-shaped bearing-face opposing the >-shaped end of the draw-head shank, all being arranged substantially as shown and described.

3. In a car-coupler, the combination with the draw-head formed with a shank having a <-shaped end bearing, a headed stud upon the upper and lower sides, adjacent the end bearing, and a projecting flange or lip on the said upper and lower faces, curved in transverse direction; of the ⊐-shaped draw-bar strap, having elongated slots, adapted to coöperate with the aforesaid headed studs, the extremities of said strap having curved members to slide under the curved lips or flanges on the draw-head shank, the bearing-block, longitudinally movable in the ⊐-shaped strap or bar, said block having a W-shaped end bearing to oppose the V-shaped bearing of the draw-head shank, and provided with a longitudinal slot, the cross pin or bolt for joining the block and the strap and the spring in said slot, all being arranged substantially in the manner and for the purposes shown and described.

709,889. ADJUSTABLE PLATEN. DANIEL M. LESTER, Norwich, Conn. Filed Feb. 24, 1902. Serial No. 96,208. (No model.)

Claim.—1. In combination with the platen of an envelop-machine, and a rim mounted to slide thereon, a spider as set forth, means for rigidly connecting the said spider and rim, and means for adjusting the combined spider and rim relatively to the said platen.

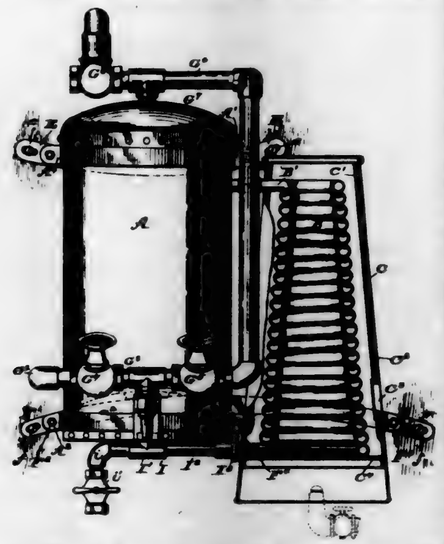
2. In combination with a platen and a rim mounted to slide thereon, a spider, and means consisting of bushings and screws, as herein set forth, for rigidly connecting the said spider and rim.



3. In combination with a platen having flanged sides, a rim mounted to slide on said platen, a spider, and means for rigidly connecting the rim and spider consisting of bushings and screws as set forth; the said bushings being slidably mounted in holes in the flange of the platen.

4. In combination, a platen, a rim slidably mounted on said platen, a threaded boss, means for rigidly connecting said boss with the said rim, a thumb-nut screwed upon the said boss, and means for retaining the said thumb-nut in a given relation to the platen whereby the rotation of the thumb-nut will cause the boss and connected rim to be adjusted relatively to the platen.

709,840. WALL WATER-HEATER. JAMES H. MACKLEY, Pocatello, Idaho. Filed Mar. 26, 1902. Serial No. 100,079. (No model.)

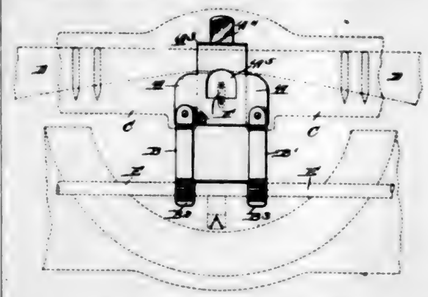


Claim.—1. The heater herein described, comprising the tank, the straps applied to the tank near its upper and lower ends, and provided at their ends with the lugs at the rear side of the tank, the heater proper located alongside the tank and comprising the coil connected at its upper and lower ends with the tank and tapering toward its upper end, the casing fitting over the coil and having the stop-plate closing the space between the casing and the coil at the lower end of the latter, the lug secured to the casing and arranged at the rear side thereof approximately in line with the corresponding lugs of the tank, the upper supporting-bar connected near its ends with the lugs at the upper end of the tank and deflected vertically at its ends which extend beyond said lugs, and having each extensions perforated for the securing-bolts, and the lower supporting-bar provided at its middle with means for connection with the lug at the rear side of the tank, and between the same and the heater proper, and secured near its ends to the lugs at the lower sides of the lower ends of the tank and heater proper, and having extensions beyond such connections, said extensions being deflected vertically and perforated, the water-supply pipe having a connection with the tank and a branch extending thence alongside the tank and provided with a discharge and with valves on opposite sides thereof, and a pipe connection leading thence to the upper end of the tank, substantially as and for the purposes set forth.

2. In a wall water-heater, the combination with the tank, and the heating means, of lugs in connection with the tank, and at the opposite sides thereof, and a supporting-bar detachably connected near its ends with said lugs and extended beyond such points of connection, and having its said extensions deflected vertically and perforated for the passage of the securing-bolts, substantially as set forth.

3. In a wall water-heater, the combination with the tank and the heater proper alongside the same, of the straps applied to the heater proper and the tank and having at their ends lugs or extensions for connection with the supporting-bars, and the bars secured to said lugs or extensions and having their ends deflected vertically and perforated, substantially as set forth.

709,841. TYPE-HOLDER FOR TYPE-WRITERS. ISAAC H. MALLER, Chicago, Ill., assignor of one-half to John F. Butler, Chicago, Ill. Filed Apr. 2, 1902. Serial No. 101,103. (No model.)



Claim.—1. In a device for holding type-writer types while being cleaned, the combination with the oscillatory shift-rail of the type-writer, of a plate having means for engagement under the type-head when elevated and means operatively connecting said plate with the shift-rail to cause it to alternately engage and release the type-head as the rail is oscillated, substantially as set forth.

2. In a device for holding type-writer types while being cleaned, the combination with the oscillatory shift-rail of the type-writer, of a plate having an orifice for the passage of the type, adapted to engage under the head when elevated, and means operatively connecting said plate with the shift-rail to cause it to alternately engage and release the type-head as the rail is oscillated, substantially as set forth.

3. In a device for holding type-writer types while being cleaned, the combination with the oscillatory shift-rail and a ribbon-guide of the type-writer, of a plate having means for engagement under the type-head when elevated and means operatively connecting said plate with the shift-rail to cause it to alternately engage and release the type-head as the rail is oscillated, said plate resting upon said guide, substantially as set forth.

4. In a device for holding type-writer types while being cleaned, the combination with the oscillatory shift-rail of the type-writer, of a plate having means for engagement under the type-head when elevated and means for engaging and deflecting the ribbon, and means operatively connecting said plate with the shift-rail to cause it to alternately engage and release the type-head as the rail is oscillated, substantially as set forth.

5. In a device for holding type-writer types while being cleaned, the combination with the oscillatory shift-rail of the type-writer, of a plate having means for engagement under the type-head when elevated, and a fork for engaging and deflecting the ribbon, and means operatively connecting said plate with the shift-rail to cause it to alternately engage and release the type-head as the rail is oscillated, substantially as set forth.

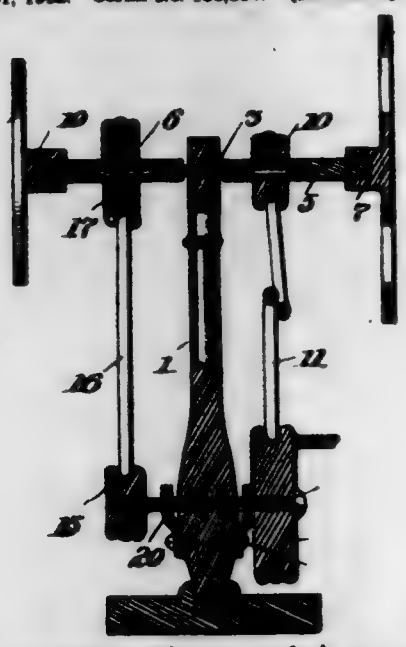
6. In a device for holding type-writer types while being cleaned, the combination with a ribbon-guide of the type-writer having a type-opening, of a plate having means for engaging and supporting the type when elevated, said plate having a wide portion adapted to rest upon said guide at the sides of said type-opening and a narrower portion having means for engaging and deflecting the ribbon, adapted to fit in said type-opening, substantially as set forth.

7. In a device for holding type-writer types while being cleaned, the combination with the oscillatory shift-rail of the type-writer, of a plate having means for engaging under the type-head when elevated and means

detachable from said plate for operatively connecting it with said shift-rail, substantially as set forth.

8. In a device for holding type-writer types while being cleaned, the combination of a plate having means for engagement under the type-head when elevated, means for supporting said plate and means on said plate for engaging and deflecting the ribbon, comprising a fork for receiving the ribbon and an extension on the lower prong of said fork for directing the ribbon into said fork, substantially as set forth.

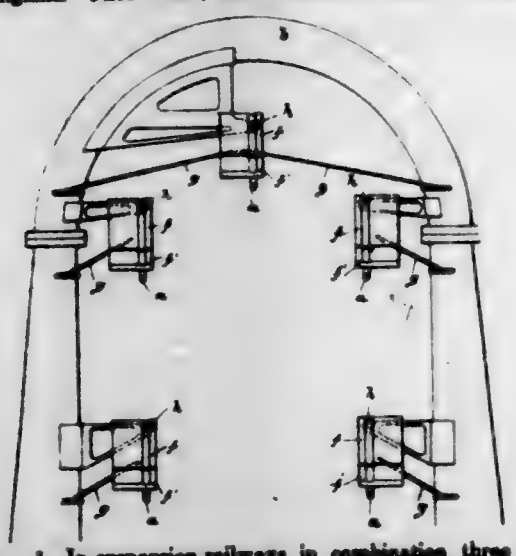
709,842. TOY BIOGRAPH. WILLIAM MAXWELL, Pittsburg, Pa. Filed May 21, 1902. Serial No. 108,397. (No model.)



Claim.—1. In a device of the type set forth, the combination of a standard, a stationary shaft secured in the upper end of the said standard, rotatable shafts journaled on the ends of the said fixed shaft, a shutter secured on the outer end of one of the said rotatable shafts, a disk secured on the said other rotatable shaft, and means for rotating the said shutter and disk in opposite directions, substantially as described.

2. In a toy biograph, the combination of a standard, a shaft fixed in the upper end of the said standard, rotatable shafts journaled on the ends of the said fixed shaft, pulleys secured on the said rotatable shaft, a shutter, and a disk secured on the ends of the said rotatable shafts, a shaft journaled in the lower end of the said standard, a large and small pulley secured on the opposite ends of the said last-named shaft, spring-plates secured to the opposite sides of the standards adjacent the last-named pulleys, and means whereby said first-named pulleys and shafts are rotated in opposite directions at different speeds, substantially as and for the purpose specified.

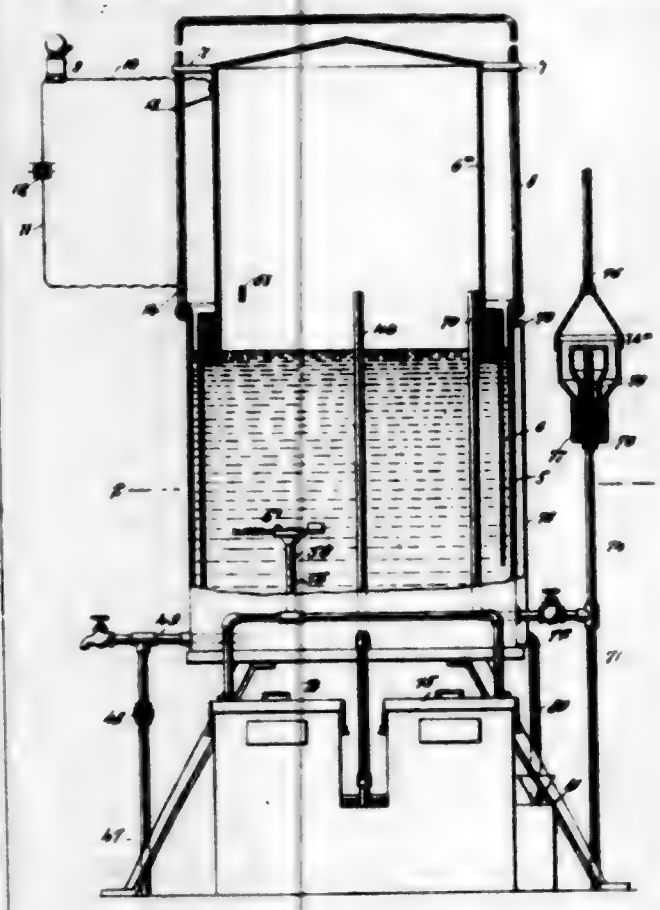
709,843. SUSPENSION-RAILWAY. ALFRED H. MAYHEW, Balham, England. Filed Jan. 6, 1902. Serial No. 88,646. (No model.)



Claim.—1. In suspension-railways in combination, three or more wire cables or ropes, secured to a series of structures or supports, a car built into strong frames carrying grooved wheels or pulleys which run on aforesaid wire cables or ropes, hinged platforms carried by said structures or supports onto which the cars run when passing said structures or supports said hinged platforms being supported by sliding supports, a loose rope or cord running underneath each cable or rope, substantially as described and illustrated herein.

2. In tube or underground railways in combination, three or more wire cables or ropes, secured to a series of brackets or supports, a car built into strong frames carrying grooved wheels or pulleys which run on aforesaid wire cables or ropes, hinged platforms carried by said brackets or supports onto which the cars run when passing said brackets or supports, said hinged platforms being supported in lower position in a suitable manner, a loose rope or cord running underneath each cable or rope, curved rails or platforms at desired points onto which the cars run from the cables, substantially as described and illustrated herein.

709,844. ACETYLENE-GAS GENERATOR. CHARLES W. METCALF, Tucson, Ariz. Filed Sept. 9, 1901. Serial No. 74,814. (No model.)



Claim.—1. In a gas-machine, a gasometer, a generator, a pipe providing communication between the gasometer and generator, the said pipe at its portion within the gasometer being provided with two upward extensions, one of said extensions having a bore or inlet smaller than the bore or inlet of the other extension, valves controlling the inlets, and means carried by the gasometer-bell for opening the valves one after the other, substantially as specified.

2. In a gas-machine, a gasometer, a generator, a pipe providing communication between the gasometer and generator, the said pipe at its portion within the gasometer, being provided with two upward extensions, one of said extensions having a bore or inlet smaller than the bore or inlet of the other of said extensions, swinging valves controlling the inlets, and means carried by the gasometer-bell for opening the valves, substantially as specified.

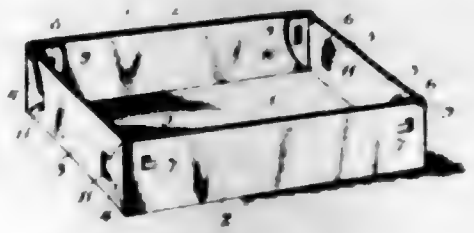
3. In a gas-machine, a generator comprising a carbid-holder for receiving pans or the like, a water-sealed casing in which the holder is arranged, means for controlling the supply of water to the holder, and a scrubber in one side of the holder through which the gas is designed to pass, substantially as specified.

4. In a gas-machine, a carbid-holder, a water-supply pipe adjacent the said holder, a cover for said holder extending over said pipe, a removable nozzle for the pipe adapted to extend into said holder, a yoke for locking the pipe and nozzle together, a valve in the nozzle, and a float having connection with said valve, substantially as specified.

709,845. PAPER BOX. HARRY S. MILLER, Westfield, Mass. Filed May 26, 1902. Serial No. 108,963. (No model.)

Claim.—A paper box formed of a single piece of material and comprising the bottom 1 formed with the sides 2 and ends 3, flaps 4 formed upon the sides 2 with the hooks 5 having projecting ears 6, flaps 9 provided with openings 10, formed upon the ends 3, tongues 7 having ears 8 stamped from the sides 2 adjacent to the hooks 5, and openings 11 provided in the ends 3 adjacent to the openings 10, the flaps 4 upon the sides being adapted to lap the ends 3 and the hooks 5 inserted from the out-

side inwardly into the openings 11, the ears 6 of said hooks engaging the tops of said openings, the flaps 9 upon the ends 3 being adapted to lap upon the inside of the sides 2, the tongues 7 inserted inwardly through the openings 10 and the ears 8 upon said tongue engaging the upper ends of said openings 10 whereby the sides of said box are doubly locked to the ends and the ends of said hooks and tongues located upon the inside of the box to prevent damage incident to rough usage, substantially as set forth.



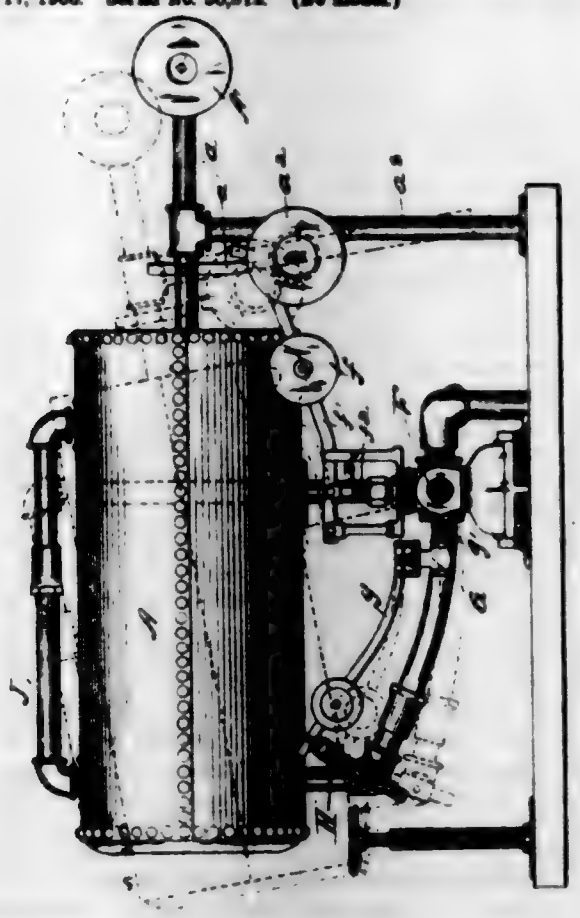
709,346. **WINDOW-SCREEN.** HENRY D. MILLS, Pisha Eddy, N. Y., assignor of one-half to Patrick H. Lawless, Eastbranch, N. Y. Filed July 3, 1901. Serial No. 67,050. (No model.)

Claim.—1. The combination with a window sash and frame, of a screen mounted in a chamber in the sill, an L-shaped plate secured to the upper end of the screen, and provided with an opening, and a bail provided with an operating-pin to extend through said opening permitting the bail to engage the under side of the horizontal member of the plate securing it to the sash.

2. The combination with a sash and frame, of a screen mounted on the frame, a bail provided with an operating-pin and constructed of a single piece of resilient material having its ends bent at right angles, means for securing the bail to the sash, and means carried by the screen to be clamped, by the bail, securing the screen to the sash.

3. The combination with a window sash and frame, of a screen mounted in a chamber in the sill, an L-shaped connecting-plate secured to the upper end of the screen and provided with a central opening, a bail provided with an operating-pin and constructed of a single piece of resilient material having its ends bent at right angles and perforated, and means for securing said bail to the sash.

709,347. **STEAM-TRAP.** JOHN MORRHEAD, Detroit, Mich. Filed Sept. 17, 1900. Serial No. 30,312. (No model.)



Claim.—1. In a steam-trap, the combination of a tilting receiving-chamber, a suitably-supported transverse rocking pipe having a closed partition to divide its length, a steam-pipe leading from one section of said transverse pipe into the receiving-chamber, a valve to control the admission of steam governed by the tilting of said chamber, a pipe leading from the opposite section of said transverse pipe into the receiving-chamber, a cross-pipe for conducting the water of condensation communicating with one end of the transverse pipe, and check-valves located in said cross-pipe, one on each side of the junction of the transverse and cross pipes, whereby the water of condensation may be admitted to, and discharged from the receiving-chamber through the section of the transverse rocking pipe opposite that through which steam is admitted to the receiving-chamber, as the position of the tilting chamber will determine, substantially as described.

2. In a steam-trap, the combination with a receiving-chamber, a water-inlet and discharge pipe suitably controlled, a steam-inlet pipe communicating with the interior and discharging near the top of the receiving-chamber, a valve for controlling the admission of steam to said pipe, an air-relief valve communicating with said steam-inlet pipe, and means for automatically opening the steam-inlet valve and closing the air-relief valve by the tilting of the receiving-chamber in one direction and for closing the steam-valve, and opening the air-relief valve when the chamber is tilted in the opposite direction, substantially as described.

3. In a steam-trap, a tilting receiving-chamber, pipes for admitting and discharging the water from the receiving-chamber suitably controlled, a steam-inlet pipe having its point of discharge in the receiving-chamber and near its top, and a pipe or steam-space located above said receiving-chamber and communicating with the interior at or near both ends of the chamber substantially as described.

709,348. **RAILROAD-TIE PLATE.** VARDRY E. McBEE, Norfolk, Va. Filed May 28, 1902. Serial No. 109,311. (No model.)

Claim.—1. The herein-described tie-plate for railroad-tracks, having the flat upper side to form a seat for the rail and provided at one end with an upwardly-projecting boss whose inner side is diagonal to the direction of length of the plate and forms a square stop-shoulder for the rail-base in the use of the device, the under side of the plate being formed with longitudinally-extending sloping sides merging at their lower edges in a cutting edge, and the said sloping sides extending at their upper edges to the upper flat face of the tie-plate, and provided at the opposite ends of the plate and said cutting edge with the depending conical prongs, substantially as and for the purposes set forth.

2. A railroad-tie plate provided on its under side with the central longitudinally-extending cutting edge and having at the ends of said edge the depending conical prongs whereby the plate may be forced into the face of the tie and be self-retaining in use, substantially as set forth.

3. The combination with the tie and the rail thereon, of the tie-plate embedded in the tie and below the rail and extending longitudinally in a direction diagonal to that of the rail and having on its upper side a shoulder to rest squarely against the rail-base and on its under side integral means for holding the tie-plate from lateral displacement on the tie, substantially as set forth.

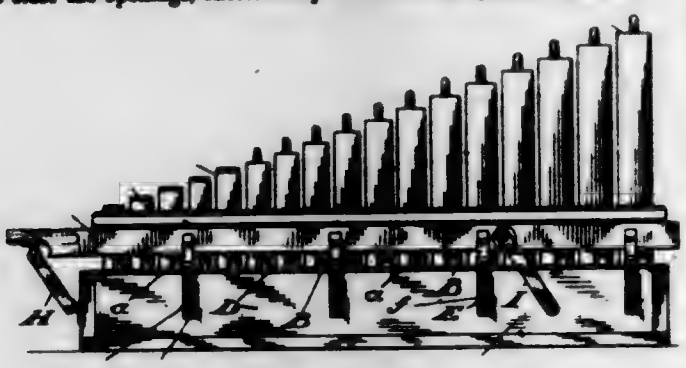
4. A railroad-tie plate having its under side provided with a longitudinally-extending cutting edge and with the opposite sloping sides leading from such edge to the upper surface of the plate, whereby the plate may be forcibly embedded bodily in the tie, substantially as set forth.

5. A railroad-tie plate provided on its upper side at one end with a boss having its inner face arranged to form a shoulder for abutment by the rail-base and provided on its under side with the longitudinally-extending cutting edge and at the ends of said edge with the depending prongs to enter the tie, substantially as set forth.

6. A railroad-tie plate provided at its upper side at one end with a boss having its inner face arranged diagonally to the plate and arranged to form a shoulder for abutment by the rail-base and provided on the under side of said tie-plate with integral means for holding the tie-plate from lateral displacement on the tie, substantially as set forth.

709,349. **COMPENSATING ORGAN-PIPE.** JOHN A. McINTOSH and WILLIAM McINTOSH, Toronto, Canada, assignors, by direct and mesne assignments, to Peter Ryan, Joseph Ross, and David J. Johnston, Toronto, Canada. Filed Oct. 22, 1900. Serial No. 33,994. (No model.)

Claim.—1. A series of organ-pipes having compensating openings formed therein, in combination with a leveling-strip secured against the pipes, to form one edge of each opening, and a general regulator movable over the said openings and adapted to engage the said leveling-strip to close the openings, substantially as and for the purpose specified.



2. A series of organ-pipes having compensating openings formed therein, in combination with a general regulator formed of a strip of stiff non-warpable material faced with a strip of a yielding material on the side next the pipes, and spring-actuated means for pressing the regulator against the pipes, substantially as and for the purpose specified.

3. A series of organ-pipes having compensating openings formed therein, in combination with a leveling-strip secured against the pipes to form one edge of each opening, a general regulator movable over the said openings and adapted to engage the said leveling-strip to close the openings, and spring-actuated means for pressing the regulator against the pipes, substantially as and for the purpose specified.

4. A series of organ-pipes having compensating openings formed therein, in combination with a general regulator movable over the said openings and spring-actuated means for pressing the regulator against the pipes, substantially as and for the purpose specified.

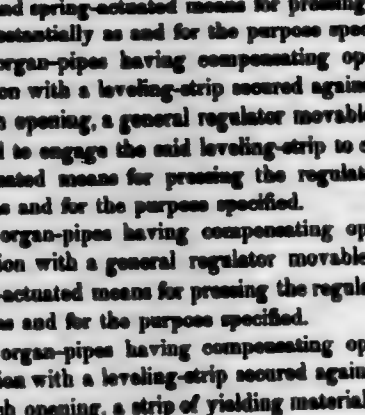
5. A series of organ-pipes having compensating openings formed therein, in combination with a leveling-strip secured against the pipes to form one edge of each opening, a strip of yielding material secured to the said leveling-strip; and a general regulator movable over the said openings and adapted to engage the said leveling-strip to close the openings, substantially as and for the purpose specified.

6. A series of organ-pipes having compensating openings formed therein, in combination with a leveling-strip secured against the pipes to form one edge of each opening, substantially as and for the purpose specified.

7. A series of organ-pipes having compensating openings formed therein, in combination with a general regulator and a stop for limiting the motion of the regulator so that it always forms one edge of each opening, substantially as and for the purpose specified.

8. A series of organ-pipes having compensating openings formed therein, in combination with a leveling-strip secured against the pipes to form one edge of each opening, a general regulator movable over the said openings and adapted to engage the said leveling-strip to close the openings, and a stop for limiting the motion of the regulator so that it always forms the other edge of each opening, substantially as and for the purpose specified.

709,850. MITTEN. ROBERT B. MCMASTERS, Plymouth, N. Y. Filed Mar. 27, 1902. Serial No. 100,287. (No model.)

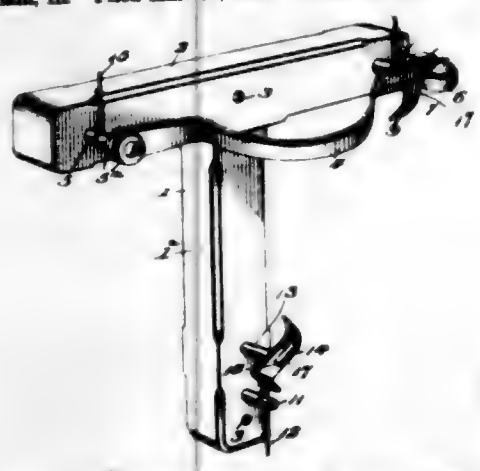


Claim.—1. As an improved article of manufacture, a glove or mitten with double protecting-guards, each sewed to the back and palm side thereof respectively by separate rows of stitching, as set forth.

2. As an improved article of manufacture, a glove or mitten, comprising in combination with the back and palm sides thereof with a welt in the joining-seam thereof, a protecting-shield folded twice upon itself forming an inner shield covering the joining-seam, and an outer shield stitched over the inner shield, as set forth.

3. As an improved article of manufacture, a mitten or glove comprising front and back sides joined together by a seam with welt therein, a double protecting guard-piece of cloth or skin which is stitched to said front and back pieces adjacent to the welt, one end of the protecting or guard piece bent upon itself and stitched to said front and back respectively, the outer end of the protecting-strip being bent upon itself and stitched over the inner end, thus forming a double guard-piece, as set forth.

709,851. TELEPHONE-SWITCH. COLUMBUS B. MCPHERSON, Birmingham, Ill. Filed Mar. 12, 1902. Serial No. 97,911. (No model.)



Claim.—1. The combination with a bracket having a plurality of binding-posts secured thereto, of a semicircular spring switch-lever having one of its ends fulcrumed and the other free for oscillatable movement, and a lever-rest secured upon said bracket adjacent to one of said binding-posts and having a curved bearing-face and a stop.

2. The combination with a bracket having a plurality of binding-posts secured thereto, of a semicircular spring switch-lever having one of its ends bent at an angle to be inserted in said bracket to form a combined binding-post and journal, and a lever-rest secured upon said bracket adjacent to one of said binding-posts, and having a curved bearing-face having one of its ends bent to form a stop.

3. The combination with a bracket, of a binding-post mounted upon the upper end thereof, a curved bearing-surface secured to said binding-post and having one of its ends bent to form a stop, a spring switch-lever having one of its ends bent at an angle and inserted in the bracket to form a combined binding-post and journal, a third binding-post secured to the lower end of the bracket, electric connections secured to said binding-post, and a lever-rest secured upon said bracket.

4. The combination of a bracket having a plurality of binding-posts secured thereto, lever-rests contiguous to the posts and provided with shouldered retaining-ribs, and a lever movable over the bracket.

709,852. PROCESS OF TREATING ANIMAL TENDONS. EDGAR NELSON, Lima, Ohio. Filed Oct. 24, 1901. Serial No. 79,816. (No specimens.)

Claim.—1. The process, herein described, of preparing packings; which consists in subjecting animal tendons to the action of preservatives and then impregnating the tendons thus treated with lubricants.

2. The process, herein described, of preparing packings; which consists in subjecting animal tendons to the long-continued action of a preservative, thus impregnating the entire substance of said tendons with said preservative, and then impregnating said tendons superficially with a lubricant for the purpose of rendering the exterior surfaces thereof smooth.

3. The process, herein described, of preparing packings; which consists in subjecting animal tendons to the action of preservatives for the purpose of rendering said tendons durable, and superficially impregnating the tendons thus treated with powdered talc for the purpose of rendering said tendons smooth and of giving them a suitable color.

4. The product herein described, consisting of packings made of preserved animal tendons impregnated superficially with lubricants.

5. The product herein described, consisting of packings made of preserved animal tendons impregnated superficially with a powdered mineral lubricant.

6. The product herein described, consisting of packings made of preserved animal tendons impregnated superficially with powdered talc for the purpose of rendering the same smooth and changing the color thereof.

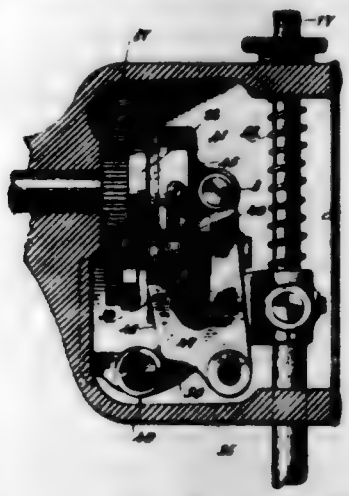
709,858. CALENDAR. WILLIAM C. NORMAN, Smithton, Ark. Filed Feb. 26, 1902. Serial No. 96,754. (No model.)

Claim.—1. A perpetual calendar, consisting of three disks, the out-

side disk having a central depression, leaving an outer rim, and on said outer rim the days of the week indicated equal distances apart; in said central depression journaled a second disk, having a double depression, leaving an outer rim 2, and on this outer rim the names of the months of the year, and in the double depression of the second disk journaled a third disk, having a flange that works in the first step of the double depression just mentioned; said disk having radial lines extending from its center, leaving between them equal spaces, and in these spaces, numerals so arranged that by turning the second and third disks, the days of the week and the month may be read perpetually; said disks each having in its center a perforation and journaled together by a nut passing through said central perforations, substantially as shown and described and for the purposes set forth.

2. A perpetual calendar, consisting of three disks, the outside disk having a central depression, leaving an outer rim, and on said outer rim the days of the week indicated equal distances apart; in said central depression journaled a second disk, having a double depression, leaving an outer rim 2, and on this outer rim the names of the months of the year, and in the double depression of the second disk, journaled a third disk, having a flange that works in the first step of the double depression just mentioned; said disk having radial lines extending from its center, leaving between them equal spaces, and in these spaces, numerals so arranged that by turning the second and third disks, the days of the week and the month may be read perpetually; said disks each having in its center a perforation; a nut passing from the rear through said perforations, and having in its front end a female thread, and at the base of said female thread an enlargement, the bottom wall of which is convex; a bolt having at its threaded end, two projections which pass into the said enlargement, and are bent out when said screw is turned home, substantially as shown and described and for the purposes set forth.

709,354. COMBINED PRESSER-FOOT AND NEEDLE-BAR LIFTING MECHANISM FOR SEWING-MACHINES. EDMOND G. O'DONNELL, Fall River, Mass., assignor, by direct and mesne assignments, to American Hat Sweat Sewing Machine Company, Fall River, Mass., a Corporation of Maine. Filed Apr. 22, 1901. Serial No. 56,960. (No model.)



Claim.—1. In a sewing-machine, the combination with the needle and presser bars, of means for driving the needle-bar, said means including a clutch, and a device in connection with the clutch and with the needle-bar and actuated from the presser-bar, said device serving first to disconnect the clutch and then raise the needle-bar.

2. In a sewing-machine, the combination with the needle and presser bars, of a driving mechanism for the needle-bar, such mechanism including a clutch, and means for disconnecting the clutch and raising the needle-bar, said means being actuated from the presser-bar.

3. In a sewing-machine, the combination with the needle and presser bars, of a driving mechanism for the needle-bar, said mechanism including a clutch, a lever in connection with the clutch, a yoke connected with the presser-bar and engaging the lever to throw open the clutch, and a member engaged and moved by the yoke upon the opening of the clutch, such member having connection, with the needle-bar, to raise it.

4. In a sewing-machine, the combination with the needle-bar of means for driving the same, said means including a clutch, and manually-operative devices in connection with the clutch and with the needle-bar, said devices serving first to disconnect the clutch, second to raise the needle-bar.

5. In a sewing-machine, the combination with the needle and presser bars, of means for driving the needle-bar, and means acting first to disconnect the needle-bar-driving means, and second to raise the needle-bar, said latter means being fastened to the presser-bar to be actuated therefrom.

6. In a sewing-machine, the combination with the drive-shaft and with the needle and presser bars, of a gear loose on the drive-shaft, a toothed sector meshed with the gear, a cranked connection between the gear and needle-bar, a clutch for fastening the gear to the drive-shaft, and a member connected with the presser-bar, said member acting first to disengage the clutch, and second, to throw the toothed sector.

7. In a sewing-machine, the combination with the drive-shaft and with the needle and presser bars, of a gear loose on the drive-shaft, a toothed sector meshed therewith, a cranked connection between the needle-bar and the gear, a clutch connecting the gear with the drive-shaft, an elbow-lever in connection with the clutch, and a yoke carried by the presser-bar, said yoke serving first to throw the elbow-lever and next to swing the sector.

8. In a sewing-machine, the combination with the drive-shaft and needle and presser bars, of a gear loose on the drive-shaft, a collar fastened to the drive-shaft, a clutch-disk or key-holder having a key or pin movable loosely through the collar and into engagement with the gear to fasten the gear to the shaft, a cranked connection between the gear and the needle-bar, a toothed sector meshed with the gear, a lever having connection with the key-holder, and a yoke carried on the presser-bar and engaging first the lever and then the toothed sector.

9. In a sewing-machine, the combination with the needle and presser bars and the drive-shaft, of a gear loose thereon, a cranked connection between the gear and the needle-bar, a toothed sector meshed with the gear, a collar fast on the drive-shaft adjacent to the gear, a key-holder having a pin or key movable loosely through the collar and into engagement with the gear, a yoke or cap with which the key-holder is connected to rotate, a lever in connection with the cap, and means operated from the presser-foot for throwing first the lever and then the sector.

10. In a sewing-machine, the combination with the needle and presser bars and the drive-shaft, of a gear loose thereon, a cranked connection between the gear and the needle-bar, a toothed sector meshed with the gear, a collar fast on the drive-shaft adjacent to the gear, a key-holder having a pin or key movable loosely through the collar and into engagement with the gear, a yoke or cap with which the key-holder is connected to rotate, a lever in connection with the cap, and means operated from the presser-foot for throwing first the lever and then the sector, said lever being of elbow form and having a diagonally-disposed surface on one arm to be engaged by said yoke of the presser-bar.

11. In a sewing-machine, the combination with the needle and presser bars and the drive-shaft, of means for driving the needle-bar from the drive-shaft, said means including a clutch, an elbow-lever connected with the clutch and having on one arm a diagonal or cam surface, and a yoke carried by the presser-bar and arranged first to engage said diagonal surface of the elbow-lever and throw the same, thus disconnecting the clutch, and second, to impart a rising movement to the needle-bar.

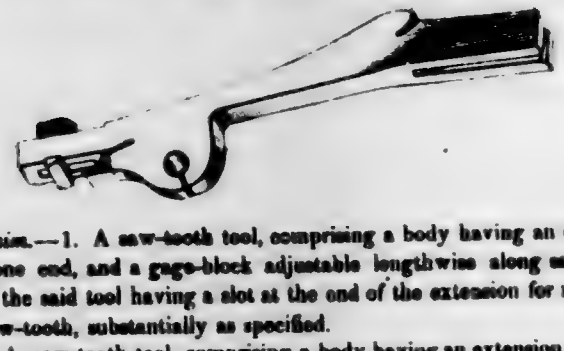
12. In a sewing-machine, the combination with the needle and presser bars and with the drive-shaft, of means for driving the needle-bar from the shaft, said means including a clutch, a member movably connected with said means to impart a rising movement to the needle-bar, an elbow-lever connected with the clutch to operate it, the said elbow-lever having on one arm a diagonal or cam surface, and a yoke carried by the presser-bar and arranged to engage said diagonal surface of the elbow-lever and then to move the said member for lifting the needle-bar.

13. In a sewing-machine, the combination with the needle and presser bars and with the tubular drive-shaft, of a gear loose on the drive-shaft, a cranked connection between the gear and needle-bar, a collar fast to the drive-shaft, a key-holder having a key sliding loosely through the collar and engageable with the gear, a rod attached to the key-holder and passing into the tubular portion of the shaft, a spring within the shaft, the

spring pressing on the rod to hold the key-holder in active position, a cap with which the key-holder has rotary connection, means for moving the cap outward to disengage the pin or key from the gear without interfering with the rotary movement of the shaft and the parts directly attached thereto, a toothed sector meshed with the loose gear, and a means actuated from the presser-bar for throwing the sector.

14. In a sewing-machine, the combination with the needle-bar of means for driving the same, said means including a clutch, a spring holding the clutch yieldingly in active position, and manually-operative devices in connection with the clutch and with the needle-bar, said devices serving first to disconnect the clutch, second to raise the needle-bar.

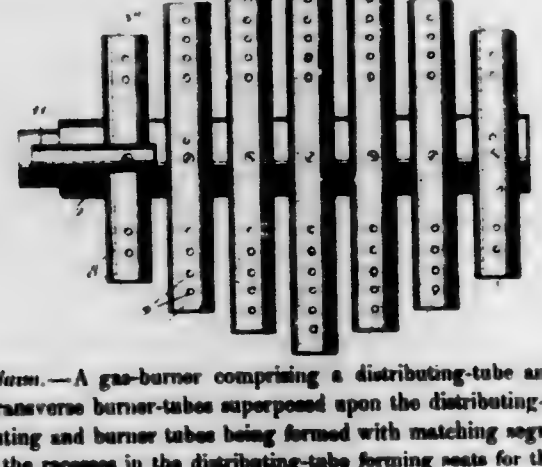
709,855. SAW-TOOTH TOOL. TORJORN OLSEN, Manistee, Mich. Filed Dec. 10, 1901. Serial No. 85,335. (No model.)



Claim.—1. A saw-tooth tool, comprising a body having an extension at one end, and a gage-block adjustable lengthwise along said extension, the said tool having a slot at the end of the extension for receiving a saw-tooth, substantially as specified.

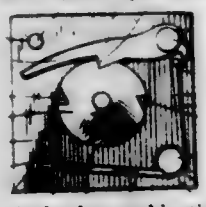
2. A saw-tooth tool, comprising a body having an extension at one end provided with a slot, a gage-block adjustable along said extension, a bolt passing from said block through the slot, and a set-nut on the bolt, the said tool having a slot at the end of the extension for receiving a saw-tooth, substantially as specified.

709,856. GAS-BURNER. JAMES W. PIPER, Waltham, Mass. Filed Jan. 23, 1902. Serial No. 90,974. (No model.)



Claim.—A gas-burner comprising a distributing-tube and one or more transverse burner-tubes superposed upon the distributing-tube, said distributing and burner tubes being formed with matching segmental recesses, the recesses in the distributing-tube forming seats for the burner-tubes, each burner-tube having a longitudinal row of perforations, vertical air-passages and an annular row of jet-orifices around said passages, and fastenings detachably connecting the burner-tubes to the distributing-tube, substantially as described.

709,857. NUT-LOCK. GEORGE L. PITTMAN, Bethesda, Ohio. Filed Jan. 25, 1902. Serial No. 91,243. (No model.)



Claim.—1. In a nut-lock, the combination with a grooved bolt, of the nut, the pawl pivoted to said nut, and having upon one side of its pivot a lug extension, and upon the opposite side of its pivot and upon the same side thereof as the pawl-tooth a handle extension, and the pressure-spring engaging said lug extension, substantially as specified.

2. In a nut-lock, the combination with a grooved bolt, of the nut, the pawl pivoted to said nut, and having upon one side of its pivot a lug extension, and upon the opposite side of its pivot and upon the same side thereof as the pawl-tooth a handle extension, a pressure-spring engaging said lug extension, and means adapted to engage said handle extension for maintaining the pawl in elevated position, substantially as specified.

3. A nut having four corner perforations, and in connection with one of them, a pin, and thereon a pawl, having a rear lug and a forward extension, in connection with a second perforation, a pin and thereon a coil-spring having one of its arms engaging the rear lug of said pawl and its other arm engaging the third perforation, the fourth perforation being adapted to receive a hold-off pin, substantially as specified.

709,858. PROCESS OF DESULFURIZING FURNACE-GASES. EMIL POLLACSEK, Budapest, Austria-Hungary. Filed Mar. 10, 1902. Serial No. 97,631. (No specimens.)

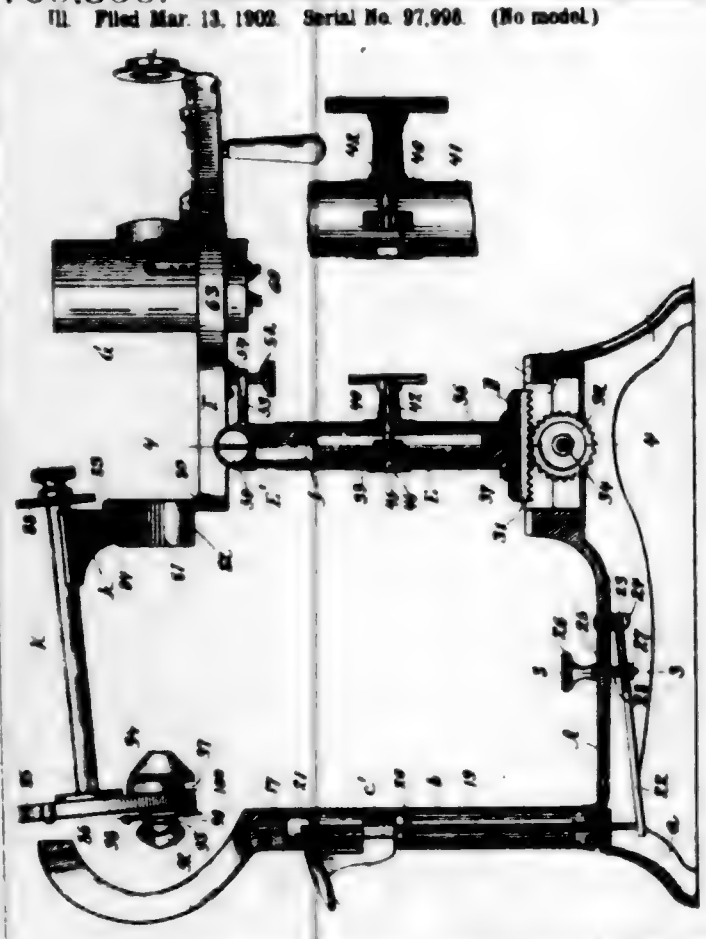
Claim.—1. A method for desulfurizing furnace-gases, which consists in passing the gases through a filter arranged adjacent to the fuel-plates of the furnace and formed by the action of the gases upon a mass consisting of lime, sawdust, not-caking fuel, caking fuel and peat.

2. A method for desulfurizing furnace-gases which consists in passing the gases through a mass consisting of caustic lime, an easily-combustible component, a less-combustible component, and peat.

3. A method for desulfurizing furnace-gases which consists in passing the gases through a sponge-like material formed by the action of the gases upon a mass consisting of ten to fifteen parts by weight of sawdust, thirty to thirty-five parts by weight of not-caking fuel, twenty to twenty-five parts by weight of caking fuel, thirty to thirty-five parts by weight of peat and six to twenty parts by weight of caustic lime.

4. A method for desulfurizing furnace-gases which consists in passing the gases through a filter arranged adjacent to the fuel-plates and formed by the action of the gases upon a mass consisting of caustic lime, an easily-combustible component, a less-combustible componet, caking fuel, and peat.

709,359. OPTICAL INSTRUMENT. SETH A. RHODES, Chicago, Ill. Filed Mar. 13, 1902. Serial No. 97,998. (No model.)



Claim.—1. In optical instruments, a suitable frame adapted at one end for the patient, a light-screen and a mirror having a peep-hole mounted at the opposite end, and means on said frame substantially midway between its ends and in the line of sight between said mirror and eyepiece for supporting an eyepiece and test-lens closely adjacent the patient's eye for refractive test and an object-glass midway between the ends of the instrument for ophthalmoscopic examination.

2. In optical instruments, a suitable frame having means at one end for positioning the patient's head, a light-screen and a mirror having a peep-hole mounted at the opposite end and a support substantially midway between the ends of the frame and in the line of sight between said mirror and eyepiece whereon may be interchangeably mounted suitable retinoscopic and ophthalmoscopic attachments.

3. In optical instruments, a suitable frame adapted at one end for the patient, a light-screen and a mirror having a peep-hole at the opposite end, a stub-socket on said frame substantially midway between the ends

and in the line of sight between said mirror and eyepiece and a lens-carrier removably supported on the frame at said stub socket.

4. In optical instruments, a frame having means at one end for positioning the patient's head, a light-screen and a mirror having a peep-hole at the opposite end, a horizontal tubular stub-socket on said frame substantially midway between its ends and in the line of sight between said mirror and eyepiece and a lens-carrier having a companion stub-socket removably carried on the frame thereby.

5. In optical instruments, a suitable base, means for positioning the patient's head mounted at one end of said base, a standard mounted at the opposite end, a horizontal support pivoted to swing upon the upper end of said standard, a light-screen and a mirror having a peep-hole carried on said support at its outer end, a stub-socket provided on said support midway between the ends of the instrument and a lens-carrier having a companion stub-socket removably carried thereby upon said frame.

6. In optical instruments, a frame comprising a suitable base having means at one end for positioning the patient's head, a supporting-arm mounted to swing in a horizontal plane at the opposite end, a light-screen and a mirror having a peep-hole mounted at the outer end of said supporting-arm, a stub-socket carried on said supporting-arm substantially midway between the ends of the instrument and a lens-carrier having a companion stub-socket removably carried thereby upon the frame.

7. In optical instruments, a frame having a head-rest at one end, a horizontally-disposed support at the opposite end, a light-screen and a mirror having a peep-hole mounted upon the outer end of said support, a horizontally-disposed stub-socket mounted upon said support substantially midway between said head-rest and said mirror and a lens-carrier having a companion stub-socket removably carried thereby upon the frame.

8. In optical instruments, a frame comprising a base having a standard at one end, a chin-rest carried thereby, a second standard at the opposite end of the base, a horizontally-disposed supporting-arm pivoted to the upper end of said supporting-standard, a light-screen and a mirror having a peep-hole mounted at the outer end of said supporting-arm, a stub-socket on said supporting-arm substantially midway between the ends of the instrument and a lens-carrier having a companion stub-socket removably carried thereby upon the frame.

9. In optical instruments, the combination with a suitable base having means at one end for positioning the patient's head, an adjusting-standard at the opposite end, an open, horizontally-disposed arm pivoted to the upper end of said adjusting-standard, a light-screen and a mirror having a peep-hole mounted upon the outer end of said supporting-arm, said light-screen and mirror being independently shiftable from side to side in a horizontal plane, a stub-socket upon the inner end of said arm and a lens-carrier having a companion stub-socket carried thereby upon the arm.

10. In optical instruments, a suitable base, a head-rest mounted thereon at one end, a supporting-standard at the opposite end, a support pivoted to swing in a horizontal plane upon the upper end of said second standard, a light-screen and a mirror having a peep-hole upon the outer end of said support, a stub-socket on said support substantially midway between said mirror and said head-rest and a lens-carrier having a companion stub-socket removably carried thereby upon said support and means for adjusting said support to and from said head-rest.

11. In optical instruments, the combination with a base having a head-rest at one end, a standard at the opposite end, a horizontally-disposed support pivoted to swing in a horizontal plane upon said standard, a light-screen and a mirror carried upon the outer end of said support, a stub-socket on said support, a lens-carrier having a companion stub-socket removably carried thereby upon the support and means for tilting said support in a vertical plane upon the upper end of said standard.

12. In optical instruments, a suitable base having a head-rest at one end, a supporting-standard at the opposite end, a horizontally-disposed support having a pivot-piece engaging said standard, a light-screen and a mirror mounted upon the outer end of said support, a stub-socket on said support substantially midway between said mirror and said head-rest, a lens-carrier having a companion stub-socket removably carried thereby upon said support, means for shifting said standard and parts carried thereby to and from said head rest, means for vertically adjusting said standard and means for tilting said support and parts carried thereby in a vertical plane upon the upper end of said pivot-piece.

13. In optical instruments, a hollow base portion having a hollow upright standard at one end, a chin-rest projecting through a slot in the upper end of said hollow standard, a vertical supporting-rod for said chin-rest within said hollow standard and projecting downwardly within said hollow base portion, guides within said standard for said rod, a substantially horizontal shift-lever within said hollow base portion and pivoted at one end thereto with its free end loosely engaging the lower end of said supporting-rod, a vertically-disposed adjusting-screw extending loosely through said base portion and loosely through said shift-lever intermediate its ends, an external thumb-piece upon the upper end of said adjusting-screw, a nut threaded to the lower end of said adjusting-screw and engaging said shift-lever and a spring coiled about said adjusting-screw and interposed between said base portion and said shift-lever, substantially as described.

14. In optical instruments, the combination with a suitable base, a hollow standard at one end, an oval head-rest carried at its upper end, a chin-rest projecting through an opening in the side of said hollow standard near its upper end, a supporting-rod for said chin-rest mounted to slide vertically within said tubular standard, a shift-lever arranged to engage the lower end of said rod and a thumb-nut for adjusting said shift-lever.

15. In optical instruments, a suitable base having a head-rest at one end and a supporting-standard at the opposite end, a support having a light-screen, a mirror and a lens-carrier in opposed relation mounted upon said standard and means for adjusting said standard and parts carried thereby to and from said head rest comprising a slide whereon said standard is mounted, guideways upon the base portion engaged by said slide, a rack upon the under side of said slide and a pinion journaled within a recess in said base portion engaging said rack.

16. In optical instruments, a suitable base portion having a head-rest at one end and a supporting-standard at the opposite end, a support carrying a light-screen, a mirror and a lens-carrier in opposed relation mounted upon the upper end of said standard, means for adjusting said standard and support to and from said head-rest comprising a dovetailed slide upon which said standard is mounted, dovetailed guideways upon said base for said slide, a rack fixed to the under side of said slide, a pinion mounted within a recess in said base and engaging said rack, a horizontal shaft extending through said base whereon said pinion is mounted and adjusting thumb-nuts secured to the end of said shaft.

17. In optical instruments, a suitable base portion, a support having a light-screen, mirror and lens-carrier in opposed relation, a standard for carrying said support upon said base portion, said standard comprising two tubular sections sleeved together one of which is shiftable longitudinally within the other, means for holding said shiftable section against lateral twist, a rack fixed to the inner face of said shiftable section, a pinion within said shiftable section engaging said rack, a stub-shaft extending through both of said tubular sections upon which said pinion is mounted, a sleeve wherein said shaft is journaled mounted upon said fixed section and an external adjusting thumb-nut secured to the outer end of said stub-shaft.

18. In optical instruments, a suitable base portion, a support having a light-screen, mirror and lens-carrier in opposed relation, a standard for carrying said support upon said base portion, said standard comprising inner and outer tubular sections sleeved together, a rack fixed to the inner face of said inner section, a pinion within said inner section engaging said rack, a stub-shaft whereon said pinion is mounted extending through a vertical slot in said inner section, a sleeve fixed to the outer section wherein said stub-shaft is journaled, a thumb-nut journaled upon the outer end of said shaft and a guide-piece fixed to the outer section engaging a longitudinal slot in the inner section.

19. In optical instruments, a suitable base portion, a support having a light-screen, mirror and lens-carrier in proper opposed relation, a standard for carrying said support upon said base portion, said standard comprising inner and outer sections sleeved together, a longitudinal rack fixed to the inner face of the inner section, a pinion engaging said rack, a horizontal stub-shaft whereon said pinion is mounted having a conical outer end, a sleeve having a corresponding conical bore within which said stub-shaft is journaled and an adjusting thumb-nut arranged to hold said stub-shaft snugly within the conical bore of said sleeve, whereby the inner section will be frictionally held in any one of its adjusted positions.

20. In optical instruments, a suitable base portion, a support having a light-screen, mirror and lens-carrier in proper opposed relation, a standard for carrying said support upon said base portion, said standard comprising inner and outer tubular sections sleeved together, a longitudinal rack fixed to the inner face of the inner section, a pinion engaging said rack, a horizontal stub-shaft for said pinion projecting through a slot in the inner section and having a conical outer end, a sleeve having a conical bore fixed to the outer section wherein said stub-shaft is journaled, an adjusting thumb-nut fitting the outer end of said shaft and engaging the outer end of said sleeve and a screw threaded through a central opening in said thumb-nut and into the outer end of said shaft for securely holding the latter within the conical bore of said sleeve.

21. In optical instruments, a suitable horizontally-disposed support, a light-screen, mirror and lens-carrier mounted on said support in opposed relation, a base portion and a standard for carrying said support upon said base portion, said standard comprising two tubular sections adjustably sleeved together, a pivot-piece fitted within the upper end of the inner standard-section and a hinge connection between said pivot-piece and said support, whereby the latter may swing in a horizontal plane and be tilted in a vertical plane.

22. In optical instruments, a horizontally-disposed support, a light-screen, mirror and lens-carrier mounted thereon in opposed relation, a

standard for said support, a pivot piece fitted within the upper end of said standard, a hinged connection between said pivot-piece and said support comprising abutting semicircular hinged sections and a connecting pivot-bolt, an arm fixed to the upper end of said pivot-piece and an adjusting-screw extending between the outer end of said arm and said support.

23. In optical instruments, a suitable base portion, a patient's head-rest mounted at one end thereof, an upright standard at the opposite end, a horizontally-disposed support swiveled upon the upper end of said standard to swing in a horizontal plane, a light-screen, mirror and lens-carrier mounted in opposed relation upon said support, means for adjusting said support vertically upon said standard and means for adjusting said support to and from said head-rest.

24. In optical instruments, a suitable base portion, a head-rest mounted at one end thereof, an upright standard at the opposite end, a pivot-piece swiveled in the upper end of said standard, a horizontally-disposed support hinged to said pivot-piece, a light-screen, mirror and lens-carrier mounted in opposed relation upon said support and means for adjusting said standard and support to and from said head-rest.

25. In optical instruments, a horizontally-disposed support having a light-screen and mirror mounted thereon at its outer end and a stub-socket at its inner end, a retinoscopic attachment comprising an abutment having a companion stub-socket removably carried thereby upon said support at its inner end, a substantially horizontal frame member fixed at its inner end to said abutment and a lens-carrier and patient's eyepiece carried at the outer end of said frame member.

26. In optical instruments, a suitable standard, a horizontally-disposed arm swiveled at the upper end of said standard, a light-screen and tilting mirror mounted to swing from side to side about a common center upon the outer end of said arm, an upright at its inner end, a horizontally-disposed tubular stub-socket fixed to said upright, a retinoscopic attachment comprising an abutment having a companion stub-socket removably carried thereby upon said arm, a substantially horizontal frame member fixed at its inner end to said abutment and a lens-carrier and patient's eyepiece mounted upon the outer end of said frame member.

27. In optical instruments, a suitable standard, a horizontal support upon the upper end of said standard having a light-screen and tilting mirror at its outer end and a stub-socket at its inner end, a retinoscopic attachment comprising an abutment having a companion stub-socket removably carried thereby upon said support, a horizontally-disposed tubular member fixed at its inner end to said abutment, a lens-casing and eyepiece mounted upon the outer end of said frame member, a lens-disk within said casing, an operating-rod therefor sleeved within said tubular frame member and an external adjusting-nut fixed to the inner end of said supporting-rod.

28. In optical instruments, a suitable standard, a horizontally-disposed arm swiveled to the upper end of said standard, a light-screen and tilting mirror carried upon the outer end of said arm, an upright having a horizontally-disposed stub socket upon the inner end of the arm, a retinoscopic attachment comprising an abutment having a companion stub-socket removably carried thereby upon the arm, a tubular frame member inclined to the horizontal and fixed at its inner end to said abutment, a lens-casing inclined to the vertical and fixed to the outer end of said tubular frame member, a patient's eyepiece carried upon said lens-casing, a lens-disk within said casing, an operating-rod for said lens-disk sleeved within said tubular frame member and an adjusting-nut fixed to the inner end of said rod.

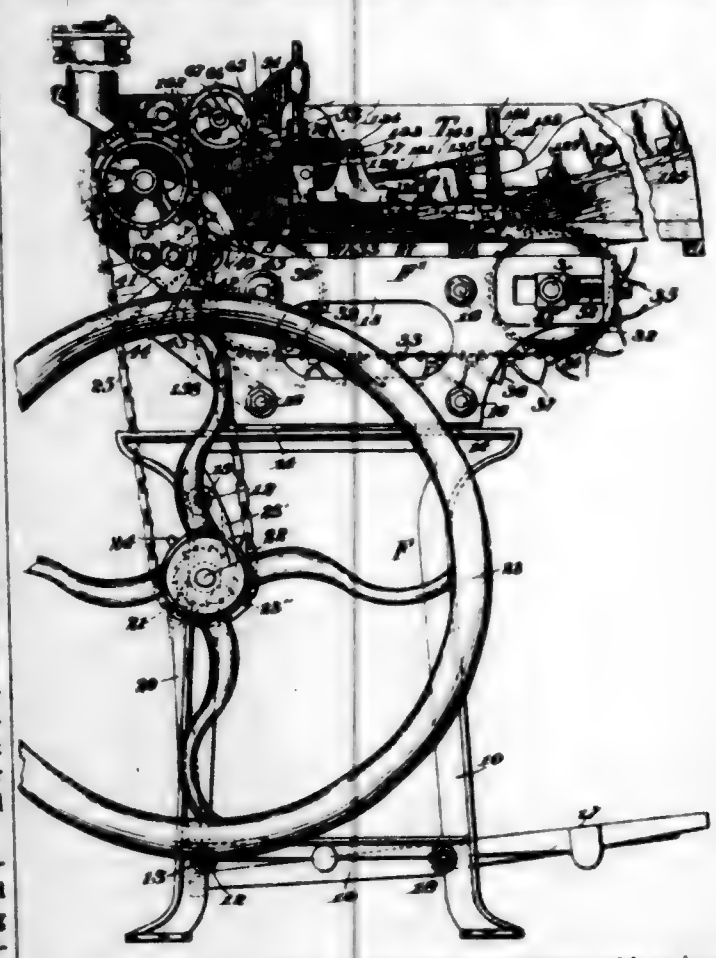
29. In optical instruments, a suitable standard, a horizontally-disposed arm swiveled to the upper end of said standard having a light-screen and tilting mirror mounted in opposed relation upon its outer end and a stub-socket at its inner end, a retinoscopic attachment comprising an abutment having a companion stub-socket removably carried thereby upon said arm, a substantially horizontal frame member fixed at its inner end to said abutment, a cylindrical lens-casing mounted upon the outer end of said frame member, an eyepiece carried upon said lens-casing near its periphery, companion lens-disks mounted in adjacent relation in said casing, operating-rods therefor sleeved together and sleeved within said tubular frame member and actuating thumb-nuts fixed to the inner ends of said rods.

30. In optical instruments, a suitable standard, a horizontally-disposed supporting-arm fixed to the upper end of said standard having a light-screen and tilted mirror mounted in opposed relation at its outer end and a stub-socket at its inner end, a retinoscopic attachment comprising an abutment having a companion stub-socket removably carried thereby upon said arm, a substantially horizontal frame member fixed at its inner end to said abutment, a lens-casing upon the outer end of said frame member, a patient's eyepiece carried on the outer side of said lens-casing, a hood fixed to the inner face of said lens-casing opposite said eyepiece and a lens-holder within said hood.

31. In optical instruments, a suitable frame or support, a light-screen and tilting mirror mounted in opposed relation at one end, an eyepiece at the opposite end, companion lens-disks mounted in adjacent relation in front of said eyepiece, operating-rods therefor sleeved together and extending inwardly toward said mirror and a pair of scale-disks fixed in adjacent relation to the inner ends of said rods, the outer scale-disk having openings through which the figures upon the inner disk may be viewed.

32. In optical instruments, a suitable frame or support, a light-screen and tilting mirror mounted at one end thereof, a tubular support at its opposite end and a patient's eyepiece fitted telescopically within said tubular support whereby it may be rotatably and longitudinally adjusted, said eyepiece being of such an irregular outline as to fit securely about either eye of the patient.

709,860. CIGAR-MARKING MACHINE. FRANCIS H. RICHARDS, Hartford, Conn. Filed Jan. 2, 1901. Serial No. 41,832. (No model.)



Claim.—1. In a marking-machine, the combination, with an intermittently-movable carrier, of intermittently-movable means for supplying marking material; and a marking device located adjacent thereto and effective to oscillate and to reciprocate toward and from each of said elements, the reciprocation relative to each element occurring at the intermission of movement of such element.

2. In a marking-machine, the combination, with a carrier adapted to support a plurality of objects to be marked, of means for supplying marking material; and a marking device located adjacent thereto comprising a plurality of sets of characters and effective to oscillate and to move toward the marking-material supply and to oscillate and to move toward the carrier.

3. In a marking device, the combination, with a carrier adapted to support a plurality of objects to be marked, of a plurality of means for supplying marking material; and a marking device located adjacent thereto, comprising a plurality of sets of characters and effective to oscillate and to move toward the marking-material supply and the carrier.

4. In a marking-machine, the combination with an intermittently-movable carrier, of a marking device located adjacent thereto and effective to move toward said carrier, and a brake operating with constant and unvarying pressure in connection with said carrier.

5. In a marking-machine, the combination, with an intermittently-movable carrier, of means for supplying marking material; a marking device located adjacent thereto and effective to move toward each of said elements; ratchet mechanism geared to the carrier; and a cam coacting with the pawl thereof for actuating the same.

6. In a marking-machine, the combination with a carrier, of a marking device located adjacent thereto and effective to move toward the carrier, and a support for the object to be marked adjacent to the carrier and normally out of contact with such object but effective to support the same upon pressure being applied thereto by the marking device.

7. In a marking-machine, the combination with a carrier, of a mark-

ing device located adjacent thereto and effective to move toward the carrier, and an adjustable support for the object to be marked adjacent to the carrier and normally out of contact with such object but effective to support the same upon pressure being applied thereto by the marking device.

8. In a marking-machine, the combination with a marking device and a carrier adapted to hold in single file longitudinally thereof the objects to be marked; of a feed-shelf adjacent to said carrier; and automatic means for delivering longitudinally to the carrier at one operation a plurality of objects to be marked.

9. In a marking-machine, the combination with a marking device adapted to mark a plurality of objects and a carrier adapted to feed in single file longitudinally thereof the objects to be marked; of a feed-shelf adjacent to said carrier; and automatic means adapted to deliver longitudinally to the carrier at one operation a plurality of objects to be marked.

10. In a marking-machine, the combination, with a marking device and a carrier, of a feed-shelf adjacent to said carrier; a movable stop coöperating with said feed-shelf to support the objects to be marked; and means for moving said objects from contact with the stop onto the carrier.

11. In a marking-machine, the combination, with a marking device and a carrier, of a feed-shelf adjacent to said carrier; a movable stop operating in connection with said feed-shelf; means for moving objects to be marked from contact with the stop onto the carrier; and a guide-plate located above the stop.

12. In a marking-machine, the combination, with a marking device and a carrier, of a feed-shelf adjacent to said carrier; a feed-arm for moving objects to be marked onto the carrier; and a pivoted guide for raising said arm upon its return movement.

13. A feeder, comprising a movable stop; a feed-arm adapted to withdraw objects from contact with said stop; and means comprising a crank-arm, a reciprocating arm and a pivoted guide-block for imparting a compound movement to the feed-arm.

14. In a marking-machine, the combination with a support for an object to be marked; means for supplying marking material; a marking device effective to oscillate and to reciprocate toward and from each of said elements; a sliding rod; a rocking guide traversed thereby; and means for regulating the length of reciprocation toward and from one of said elements.

15. In a marking-machine, the combination with means for holding an object to be marked, of means for supplying marking material; a marking device effective to oscillate and to reciprocate toward and from each of said elements; a rocking guide for supporting said device; and means for regulating the length of reciprocation toward and from one of said elements.

16. The combination, with a marking device having a plurality of marking means and a support for the objects to be marked, of a movable arm for actuating said device so connected thereto that the marking will take place while the arm is substantially parallel to the objects to be marked.

17. The combination, with a marking device having a plurality of marking means and a support for the objects to be marked, of a movable arm for actuating said device; and a plurality of means for supplying marking material provided with distributing-surfaces so situated that the arm is substantially parallel thereto during the contact of the printing device thereon.

18. In a marking-machine, the combination with a carrier, of means for supplying marking material; a marking device located adjacent thereto and effective to oscillate and to reciprocate toward and from each of said elements, and means for regulating the length of reciprocation toward and from one of said elements.

19. In a marking-machine, the combination with a carrier, of means for supplying marking material; a marking device located adjacent thereto and effective to oscillate and to reciprocate toward and from each of said elements, and means for regulating the length of reciprocation toward and from only one of said elements.

20. In a marking-machine, the combination with a carrier, of means for supplying marking material; a marking device located adjacent thereto and effective to oscillate and to reciprocate toward and from each of said elements, and means comprising an overgear device, for regulating the length of reciprocation toward and from one of said elements.

21. The combination of a marking device, an oscillating support for carrying the marking device; a movable arm upon which the support is mounted; an oscillating plate in proximity thereto; and means connecting the said arm and plate consisting of a spring.

22. The combination with a marking device and an oscillating support therefor, of a movable member upon which the support is mounted; an oscillating member in proximity thereto; a yieldable connection between the movable member and oscillating member; and a stop for the movable member.

23. The combination, with a marking device and a support for the object to be marked, of a movable member upon which said device is mounted; an oscillating mechanism in proximity thereto; a yieldable connection between said movable member and oscillating member; a stop for said movable member; and an adjustable contact device between the member and the stop.

24. The combination with a marking device and an oscillating support therefor, of a movable arm upon which the support is mounted; an oscillating plate in proximity thereto; and a spring secured to the plate and capable of contacting with the arm.

25. The combination, with a marking device and a support for the object to be marked, of a movable member upon which said device is mounted; an oscillating mechanism in proximity thereto; a yieldable connection between said movable member and oscillating mechanism; and means for adjustably limiting the amount of movement of the member independently of the oscillating mechanism.

26. A marking device, comprising a supporting member; a flexible marking-strip; and a lever system for connecting each end of the strip to the supporting member.

27. A marking device, comprising a supporting member; flexible marking means; and a compound lever for connecting each end of the strip to the supporting member, said levers being connected to each other.

28. A marking device, comprising a supporting member; a flexible strip provided with characters; compound levers for connecting the ends of the strip to the supporting member, said levers being connected to each other; and a connection between said compound levers and the supporting member.

29. The combination with a head carrying a plurality of marking devices, of a feeder comprising a reservoir; an opening therein; supply-rolls corresponding in number to the marking devices and adapted to receive the marking material from the reservoir; means for adjusting said supply-rolls toward and from each other; and means effective to bring the marking devices into contact with the supply-rolls.

30. The combination with a marking-head carrying a plurality of marking devices, and a feeder comprising a reservoir; an opening therein; supply-rolls corresponding in number to the number of marking devices; of an eccentric support for adjusting said supply-rolls toward and from each other; and means effective to bring the marking devices into contact with the supply-rolls.

31. In a marking-machine, the combination, with a marking device, driving means therefor, means for supplying marking material and a carrier, of a driving-shaft carrying means to actuate the marking device and carrier; and mechanism operative through the marking-device-driving means for actuating the supply means.

32. In a marking-machine, the combination, with a marking device, driving means therefor, means for supplying marking material and a carrier, of a driving-shaft carrying means to actuate the marking device continuously and the carrier intermittently; and mechanism operated by the marking-device-driving means for actuating the supply means.

33. In a marking-machine, the combination, with a marking device, driving means therefor, means for supplying marking material and a carrier, of a driving-shaft carrying means to actuate the marking device continuously and the carrier intermittently; and mechanism operated by the marking-device-driving means for actuating the supply means intermittently.

34. In a marking-machine, the combination, with a marking device, means for supplying marking material and a carrier, of a driving-shaft carrying a crank to actuate the marking device; and a cam contacting with ratchet mechanism to intermittently actuate the carrier.

35. In a marking-machine, the combination, with a marking device, means for supplying marking material and a carrier, of a driving-shaft carrying means to actuate the marking device; and a crank connection with ratchet mechanism to intermittently actuate the supply means.

36. In a marking-machine, the combination, with a marking device, of a carrier comprising links provided with arms adapted to support the object to be marked, one of said arms extending over that of the link next adjacent.

37. In a marking-machine, the combination, with a marking device, of a carrier comprising links provided with arms adapted to support the object to be marked, one of said arms being substantially straight and the other curved.

38. A chain, comprising links provided with arms, one of said arms adapted to extend over that of the link next adjacent.

39. A chain comprising links provided with seats to which are secured pieces having forked projections, one of which projections is straight and slightly inclined, and the other of which projections is curved in the opposite direction.

40. In a marking-machine having oppositely-located side frames, one of which extends above the other, the combination with marking means, of means for supplying marking material thereto, upon which ex-

tension the marking and supplying means are located and wholly supported.

41. A machine for marking carved objects, comprising a flexible marking-strip and yieldable means, constrained to yield in unison, supporting such strip at each end.

42. In a marking-machine, a flexible marking-strip; a supporting member therefor; and a system of levers connecting said marking-strip to said member and embracing compound levers supporting each end of said strip.

43. A marking device comprising a supporting member; a flexible marking-strip; a compound lever connected to each end of the strip; and a link connected to the opposite ends of said compound lever at one end and to said supporting means at the other end.

44. A marking device comprising a supporting member; a flexible marking-strip; a compound lever connected at one end to the end of each strip; and means for constraining said levers to move in unison.

45. A marking device comprising a supporting member; a flexible marking-strip; a compound lever connected at one end to the end of each strip; and a link pivoted to the ends of said levers.

46. A marking device comprising a supporting member; a marking-strip; plates pivoted to said supporting member and securing the respective ends of the marking-strip; arms extending transversely from said plates; and a link pivoted at one end to said supporting means and at the other end to links pivoted respectively to said transverse levers.

47. In a marking device, the combination of a supporting member having side plates extending therefrom; plates pivoted to the ends of the side plates; a system of compound levers connecting said plates to one end of an arm pivoted to one of said side plates; and a marking-strip carried by said pivoted plates.

48. In a marking device, a supporting member; a marking-strip; plates pivoted to said supporting member and carrying at their free ends the ends of the marking-strip; a compound lever connected to the respective plates; and an arm uniting the ends of said levers and connecting them to the supporting means.

49. In a marking device, the combination of a supporting member; side plates projecting therefrom; a plate pivotally supported by the free end of each of said side plates; a marking strip carried by the ends of said pivoted plates; arms projecting transversely from said pivoted plates; and a link pivoted to the free end of each of said transverse arms, said links being pivoted together.

50. In a marking-machine, the combination of a supporting means; a marking means; and a pair of toggle connections between said marking means and supporting means.

51. In a marking-machine, the combination of a supporting means; a flexible marking strip; and a pair of toggle connections between said marking-strip and supporting means.

52. In a marking-machine, the combination of a supporting means; a flexible marking-strip; a pair of toggle connections to which said strip is secured; and shiftable means for connecting said toggle connections with the supporting means.

53. In a marking-machine, the combination of a supporting means; a flexible marking-strip; a linkage connected to said supporting means and to each end of said marking-strip; and a linkage connecting said linkages together and to the supporting means.

54. In a marking-machine, the combination of a marking means; and a system of linkage adapted to permit the marking means to bend and effective to constrain the ends thereof to so bend in unison.

55. In a marking-machine, the combination of a supporting means; a flexible marking-strip; and means effective upon the contact of any portion of the marking means with the object to be marked, for constraining both ends of the marking means to move in unison.

56. In a marking-machine, the combination of a supporting means; a flexible marking-strip; and means embodying a system of linkage for making the ends bend in unison.

57. In a marking-machine, the combination of a yieldable marking-strip; and means effective upon the contact of any portion of the marking means with the object to be marked, for causing the ends of said strip to yield in unison.

58. In a marking-machine, the combination of a yieldable marking-strip; and means embodying a system of linkage for constraining the ends to move in unison.

59. In a marking-machine, the combination of a yieldable marking means; and means comprising a system of linkage after the analogy of toggles for constraining the ends to yield in unison.

60. In a marking-machine, the combination of a supporting member; a yieldable marking means; a system of linkage after the analogy of toggles connected to said marking means and to said supporting means and effective to cause the ends of said marking means to move in unison; and means for maintaining said toggles in working position.

61. In a marking-machine, the combination of a marking-strip, means operative partly by said strip for wrapping the same about an object to be marked, and means operative by the object and coöperative with the strip to effect the operation of the wrapping means.

62. In a marking-machine, the combination of a marking-strip, means comprising pivoted members for wrapping the strip about an object to be marked, said means being operative by said strip, and means operative by the object and coöperative with the strip to effect the operation of said wrapping means.

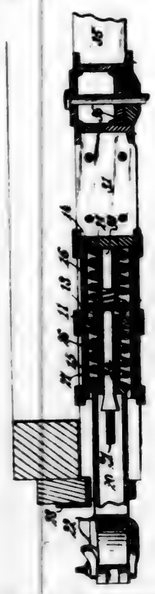
63. In a marking-machine, the combination of a marking-strip, means comprising pivoted members for wrapping the strip about an object to be marked, and means operative by said strip connecting said pivoted members and operating them to move in unison.

64. In a marking-machine, the combination of a marking-strip, means comprising pivoted members for wrapping the strip about an object to be marked, means operative by said strip connecting said pivoted members and operating them to move in unison, and means operative by the object and coöperative with said strip to effect the operation of said wrapping means.

65. In a marking-machine, the combination of side members, a marking-strip carried thereby and operating to draw said members inwardly to effect the wrapping of the strip about the object to be marked, and supplemental means coöperative with said strip for further wrapping the latter about the object.

66. In a marking-machine, the combination of side members, a marking-strip carried thereby, a toggle-joint connecting said side members, and means operated by said joint to bring said members toward each other in the region thereof on which said marking-strip is carried.

709,861. DRAFT SPRING-RIGGING FOR RAILROAD-CARS. EDWARD W. RAMES, Lasalle, Ill. Filed Jan. 21, 1902. Serial No. 90,685. (No model.)



Claim.—1. In a draft-rigging for railroad-cars, a plurality of cylinders, springs in the cylinders, a draw-bar having a push-pin, means for preventing the withdrawal of said draw-bar, a plate separating the cylinders, and the pin extending through a perforation in said plate, a piston coöperative with said pin, and a stop in the rear cylinder adapted to be engaged by said piston to limit the compression of the spring in said rear cylinder.

2. In a draft-rigging for railroad-cars, a plurality of cylinders, springs in the cylinders, a draw-bar having a push-pin, means for preventing the withdrawal of said draw-bar, a plate separating the cylinders, and the pin extending through a perforation in said plate, a piston having a conaved face to receive and center the inner end of said push-pin, and a stop in the cylinder adapted to be engaged by said piston to limit the compression of the spring in said rear cylinder.

3. In a draft-rigging for railroad-cars, a plurality of cylinders, springs in the cylinders, a draw-bar having a push-pin, means for preventing the withdrawal of said draw-bar, a plate separating the cylinders, and the pin extending through a perforation in said plate, a piston coöperative with said pin, and a stop inclosed by the spring of the rear cylinder and adapted to be engaged by said piston.

4. In a draft-rigging for railroad-cars, a plurality of cylinders, springs in the cylinders, a draw-bar having a push-pin projecting through a perforation in the rear wall of said draw bar, a key carried by the draw-bar adapted to be engaged by the outer end of the push-pin, means for preventing the withdrawal of said key, a plate separating the cylinders and said push-pin extending through said plate, a piston coöperative with said pin, and a stop in the rear cylinder adapted to be engaged by said piston.

5. In a draft-rigging for railroad-cars, a plurality of cylinders, springs in the cylinders, a draw-bar having a transverse key, means for preventing the withdrawal of said key, a push-pin provided with an enlarged head adapted to abut against said key and said push-pin projecting through a perforation in the rear wall of the draw-bar, a plate separating the cylinders, and the pin extending through a perforation in said plate, a piston separated from and adapted to be engaged by said pin, and a stop in the rear cylinder adapted to be engaged by said piston.

6. A draft-rigging for railroad-cars, including a cylinder having a backing, a coiled spring in said cylinder, a stop inclosed by the coiled spring and adapted to engage said backing, a draw-bar, means for preventing the withdrawal of said draw-bar, a disk adapted to engage said spring, and a push-pin adapted to coöperate respectively with the draw-bar and disk, and the latter having a concaved face to receive and center said push-pin.

7. A draft-rigging for railroad-cars, including a series of circumferential enlargements extending lengthwise of the same, said enlargements forming elongated grooves to thereby accommodate a draw-bar.

8. A draft-rigging for railroad-cars, including a series of circumferential enlargements extending lengthwise of the same, said enlargements forming elongated grooves to thereby accommodate a draw-bar, and said cylinder being thickened at diametrically opposite places.

9. A draft-rigging for railroad-cars, including a series of circumferential enlargements extending lengthwise of the same, said enlargements forming elongated grooves to thereby accommodate a draw-bar, and said cylinder being thickened at diametrically opposite places, and having a projection upon its under side.

10. In a draft-rigging for railroad-cars, draft-arms, liner-plates secured to the upper and lower sides of the draft-arms, cylinders separated by the lower liner-plates, vertical plates, one of which separates the cylinders and the other of which serves to close the rear end of the rear cylinder, springs in said cylinders, a draw-bar having a push-pin extending through a perforation in the forward plate, a piston coöperative with the push-pin a stop in the rear cylinder adapted to be engaged by said piston, a timber between the draft-arms, a car body-bolster, a shoe secured to said bolster and abutting said timber and struts having a similar shoe also abutting against said bolster

---

709,862. CALCULATING-MACHINE. ALEXANDER C. SCHUMAN, Louisville, Ky., assignor to Spalding Coleman, Louisville, Ky. Filed Dec. 18, 1901. Serial No. 86,455. (No model.)

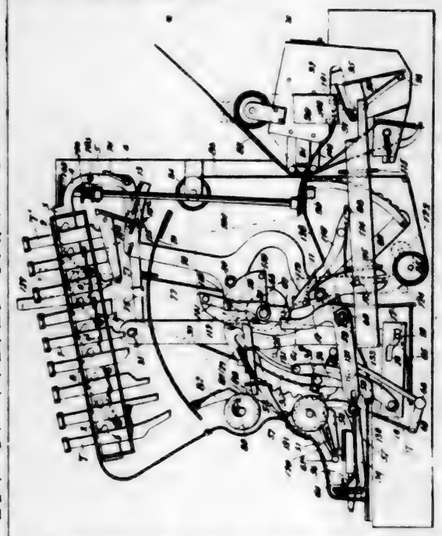
Claim.—1. In a registering mechanism, the combination of registering-wheels, vibrating segments adapted to engage and actuate the registering-wheels, keys and connections for regulating the movement of said segments, means for returning the segments to normal position, a slotted guide-plate for said segments and means for moving said plate to and from the registering-wheels, substantially as described.

2. In a registering mechanism, the combination of registering-wheels, vibrating levers, segments connected therewith adapted to engage and actuate the registering-wheels, keys and connections for regulating the movement of said levers, a rock-shaft and cams for returning the levers to normal position, a slotted guide-plate for said segments and means for moving said plate to and from the registering-wheels, substantially as described.

3. In a registering mechanism, the combination of registering-wheels, segments adapted to engage therewith, means for reciprocating said segments, movable teeth on the segments and means for throwing said teeth into operative position to effect a "carrying over" from a wheel of lower to one of higher denomination, substantially as described.

4. In a registering mechanism, the combination of registering-wheels, vibrating segments adapted to engage therewith, vibrating levers and connections for reciprocating said segments, and a movable tooth pivoted to each segment of higher denomination, with means actuated by the adjacent registering-wheel of lower denomination for throwing said teeth into operative position, substantially as described.

5. In combination, registering-wheels, vibrating or reciprocating segments adapted to engage therewith, and means for reciprocating said segments; movable auxiliary teeth on the segments, and cams adapted to be actuated by registering-wheels of lower denomination, so as to cause the movable teeth of the segments of higher denomination to come into operation, substantially as described.



6. In combination, registering-wheels, swinging and reciprocating segments adapted to engage therewith, and vibrating key-controlled levers for reciprocating said segments; with movable auxiliary teeth on the segments, and cams adapted to be actuated by registering-wheels of lower denomination to cause the movable teeth of the segments of higher denomination to come into operation and effect the "carrying over," substantially as described.

7. In combination, registering-wheels, reciprocating segments adapted to engage therewith, and means for operating said segments; spring-retracted teeth on the lower ends of the segments, wiper-cams beside the disks adapted to engage the teeth and throw them into operative position, and means for setting the cam of a disk of higher denomination by and from the disk of lower denomination, substantially as described.

8. In combination, sliding bars, keys for shifting said bars, vibrating levers adapted to be limited in their movements by said keys, and rocking levers actuated by said bars having hooked ends adapted to be engaged by pins on the vibrating levers to restrain movement of the latter unless the corresponding bar has been shifted, substantially as described.

9. In combination, sliding bars, keys for shifting said bars, vibrating levers adapted to be limited in their movements by said keys, rocking levers actuated by said bars having hooked ends adapted to be engaged by pins on the vibrating levers, to restrain movement of the latter unless the corresponding bar has been shifted, and trip latches or dogs on the hooked ends of the rock-levers adapted to be engaged by the released levers as the latter are returned to normal position and thereby cause the resetting of the bar and keys, substantially as described.

10. In combination, the registering-wheels, reciprocating segments adapted to actuate the registering-wheels, vibrating levers for operating said segments, keys for controlling the movement of said vibrating levers, and a rock-shaft and connections for positively actuating said levers; with a movable slotted guide-plate for the segments adapted to hold them in or out of engagement with the registering-wheels, and means for periodically actuating the guide-plate from the rock-shaft, substantially as described.

11. In combination, the registering-wheels, segments adapted to actuate the registering-wheels, vibrating levers for operating said segments, keys for controlling the movements of said vibrating levers, and a rock-shaft and connections for positively actuating said levers; with a movable guide-plate for the segments adapted to hold them in or out of engagement with the registering-wheels, a swinging lever, connections between the free end of said lever and the plate, a disk on the shaft, and means for periodically actuating the swinging lever from the shaft, substantially as described.

12. In combination, a series of numeral-keys, sliding bars actuated thereby, type-hammers, and a laterally-adjustable device for cocking said

hammers; with means whereby said sliding bars effect the shifting of said plate so that only the proper hammers are cocked.

13. In combination, a series of numeral-keys, sliding bars actuated thereby, type-hammers, their actuating-levers, and a laterally-adjustable device engaging said levers to cock said hammers; with an arm adapted to be actuated by said sliding bars, a vibrating lever operating said slide, and connections between said arm and lever, whereby when a slide-bar is shifted, the corresponding type-hammer is cocked, substantially as described.

14. The combination of registering-wheels, reciprocating segments adapted to mesh therewith, a rocking guide for said segments, and a rock-shaft; with a swinging lever beside said shaft having its lower end connected with the guide, and means for swinging said lever by the rocking of the shaft, substantially as described.

15. The combination of the registering-wheels, the reciprocating segments adapted to mesh therewith, a rocking guide for said segments, and a rock-shaft; with a swinging lever beside said shaft having its lower end connected with the guide so as to shift the latter; and means for swinging said lever by the rocking of the shaft, said means comprising a latch pivoted on the lever, and a disk on the shaft having two pins adapted to alternately engage the latch, substantially as described.

16. In combination, the registering-wheels, reciprocating segments adapted to mesh therewith, a guide for said segments, a rock-shaft, a swinging lever for rocking said guide, so as to normally hold the segments and registering-wheels in mesh during the registering motion of the rock-shaft, and means for actuating said lever from said shaft; with a key and connections whereby upon depression of said key the guide is caused to move the segments out of mesh during the normally registering motion of the rock-shaft.

17. In combination, the registering-wheels, reciprocating segments adapted to mesh therewith, a guide for said segments, and dogs for locking the registering-wheels, a rock-shaft, a swinging lever for rocking said guide, so as to normally hold the segments and registering-wheels out of mesh during the forward or setting motion of the rock-shaft, and means for actuating said lever from said shaft; with a key and connections whereby upon depression of said key the guide is caused to hold the segments in mesh during the forward or "setting" motion of the rock-shaft, and the dogs disengaged from the registering-wheels.

18. In combination, the registering-wheels, reciprocating segments adapted to mesh therewith, a guide for said segments, a rock-shaft, a swinging lever for rocking said guide, so as to normally hold the segments and registering-wheels out of mesh during the "setting" motion of the rock-shaft, and in mesh during the return motion thereof, and means for actuating said lever from said shaft; with a key and connections whereby the guide is caused to hold the segments in mesh during the "setting" motion of the rock-shaft, and out of mesh during the return motion thereof, said connections comprising a slide on the swinging lever, a spring-pressed pawl thereon, and a disk on the shaft adapted to engage said pawl when the key is depressed, substantially as described.

19. In combination, the registering-wheels, reciprocating segments adapted to mesh therewith, a guide for said segments, a rock-shaft, a swinging lever for rocking said guide, so as to normally hold the segments and registering-wheels in mesh during the registering motion of the rock-shaft, and out of mesh during the "setting" movement of said shaft, and means for actuating said lever from said shaft; with a key and connection whereby the guide is caused to hold the segments in mesh during the setting stroke and to move the segments out of mesh during the return or registering motion of the rock-shaft, said connections comprising a slide on the swinging lever, a spring-pressed pawl thereon, and a disk on the shaft adapted to engage said pawl when the key is depressed, a rock-lever having a tripping-pawl also engaging said disk when the key is depressed, and dog-releasing devices operated by said rock-lever, substantially as described.

20. In an adding-machine, the combination of a series of laterally-adjustable registering-wheels, a series of corresponding indicator-wheels adjustable with the registering-wheels, mechanism for operating the registering-wheels, and a rock-shaft and connections for operating said mechanism; with a single reciprocating device adapted to engage and actuate the proper indicator-wheel when the rock-shaft is operated, whereby the displacement of the registering mechanism, and the number of operations of the rock-shaft during such displacement is indicated, substantially as described.

21. In an adding-machine, the combination of a series of laterally-adjustable registering-wheels, a series of corresponding indicator-wheels adjustable with the registering-wheels, mechanism for operating the registering-wheels, a rock-shaft and connections for operating said mechanism, and means for actuating the proper indicator-wheel when the rock-shaft is operated, said means comprising a single sliding spring-retracted bar adapted to engage a gear on the opposed indicator-wheel, and an arm on the shaft engaging and actuating said bar, whereby the displacements of the registering mechanism, and the number of operations of the rock-shaft during the displacement are indicated, substantially as described.

22. In a calculating-machine, a keyboard provided with a series of keys, a main vibrating lever for each series of keys provided with stops coöperating with said keys to set the lever at the desired point, each lever having a toothed rack-segment, a series of registering-wheels provided with gears coacting with the segments, a rocking plate in which the segments are guided, means for rocking said plate, and a crank-shaft provided with means for actuating the said lever, each segment excepting the first or unit segment having an extra movable tooth normally idle, and means for moving said movable tooth into operative position.

23. In a calculating-machine, a keyboard having a series of keys, sliding bars corresponding in number with the series of keys, and rocking catch-levers corresponding in number with the series of bars and connected thereto, and having hooked lower ends; combined with a series of vibrating levers provided with stops to limit their range of movement in accordance with the depressed keys of the appropriate series, and also having pins to engage the hooked ends of the rock-levers, substantially as described.

24. In a calculating-machine, a keyboard having a series of keys, sliding bars corresponding in number with the series of keys, and rock-levers corresponding in number with the series of bars and jointed thereto, and having hooked ends provided with trip-latches or dogs; combined with a series of vibrating levers corresponding in number with the number of series of keys and provided with stops to limit their range of movement in accordance with the depressed keys of the appropriate series, and also having pins adapted to engage under the hooked ends of the catch-levers, and to engage the trip-latches of the rock-levers, and an independently-controlled bar for simultaneously throwing the various trip-latches out of operative position with relation to the vibrating levers, for the purpose and substantially as described.

25. In a calculating-machine, a keyboard having a series of keys, sliding bars corresponding in number with the series of keys, and rock-levers corresponding in number with the series of bars and jointed thereto, and having hooked ends provided with dogs or trip-latches; combined with a series of vibrating levers corresponding in number with the number of series of keys and provided with stops to limit their range of movement in accordance with the depressed keys of the appropriate series, and also having pins to engage the hooked ends and trip-latches of the rock-levers, and a bail or rod coöperating with the rock-levers adapted to effect the disengagement of the keys and key-bars, substantially as described.

26. In a calculating-machine, a carriage containing registering-wheels having gears, spring-dogs normally engaging the gears of said wheels, a dog-releasing bar automatically controlled by means interposed between it and the setting mechanism, said automatic controlling means comprising a lever, a cam-disk on the main shaft of the machine, and a setting mechanism for placing said lever in operative relation to said cam-disk.

27. In a calculating-machine, a main shaft provided with a cam-disk, a rocking plate, reciprocating segments guided in said plate, registering-wheels actuated by said segments, vibrating levers for actuating said segments, keys for setting the said vibrating levers, a lever for rocking the said plate, and means for actuating said lever periodically from said cam-disk.

28. In a calculating-machine, a main shaft provided with a cam-disk, a rocking plate, segments guided in said plate, registering-wheels actuated by said segments, vibrating levers for actuating said segments, keys and connections for setting the said levers, a lever and connections for rocking the said plate, and means to connect said plate-rocking lever periodically with said cam-disk, substantially as described.

29. In a calculating-machine, a series of registering-wheels each having a laterally-projecting pin for carrying from one to the other, combined with levers normally standing in the path of movement of said pins, spring-latches adapted to engage said levers, and automatic means periodically actuated to release said latches.

30. In a calculating-machine, a setting mechanism including vibrating levers, and keys for limiting their movement; combined with printing-bars attached to said vibrating levers and operated thereby, printing-hammers, a slide for cocking said hammers, and a slide-actuating mechanism controlled by the vibrating-lever-setting mechanism.

31. In a calculating-machine, a setting mechanism including vibrating levers, and keys and connections for setting said levers, combined with printing-bars attached to said levers and operated thereby, printing-hammers, a slide for controlling the cocking of said hammers, a slide-actuating mechanism controlled by the lever-setting mechanism, and means for releasing the hammers to effect the impression.

32. In a calculating-machine, a printing mechanism comprising type-bars, vibrating levers and means to set the said levers, a main shaft and connections for actuating the said levers, an arm on said shaft, a rock-lever coacting with said arm, a push-bar actuated by said rock-lever, hammers, and a hammer selecting and cocking device, substantially as described.

33. In a calculating-machine, a printing mechanism comprising type-bars, vibrating levers connected therewith, means to set the said levers, and a main shaft for actuating the said levers, an arm on said shaft, a rock-lever coacting with said arm, a push-bar actuated by said rock-lever, spring-pressed hammers, and a hammer selecting and cocking device, substantially as described.

34. In a calculating-machine, a printing mechanism, comprising type-bars, main vibrating levers connected to said bars, means to set the said levers, and a main shaft for actuating the said levers; an arm on said shaft, a rock-lever coacting with said arm, a push-bar actuated by said rock-lever, spring-pressed hammers, a hammer selecting and cocking device, and a rocking support therefor actuated by said push-bar, substantially as described.

35. In a calculating-machine, a slidable carriage, a registering mechanism arranged therein, means to actuate said registering mechanism, including a handle, and a latch for locking said carriage against movement at all times, excepting at half-stroke of the operating-handle.

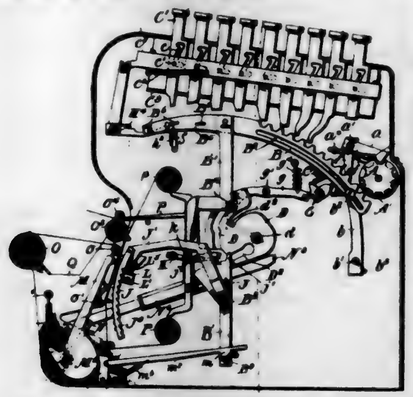
36. In a calculating-machine, a slidable carriage, registering-wheels mounted therein, and provided with gear-wheels, segments engaging said gear-wheels, a rocking guide for moving said segments into and out of engagement with the gear-wheels, means for locking the carriage against movements while the rack-bars are in engagement with the gear-wheels, actuated by the segment-carrier, and by said carrier released to permit the sliding of the carriage when the segments are withdrawn from engagement with the gear-wheels.

37. In a calculating-machine, an indicator mechanism comprising rotary drums, means to rotate said drums, a rocking guide for said means, and means to rock said guide comprising a lever, a disk on the main shaft, and a double-acting latch engaged at opposite ends alternately by said disk and thereby effecting a positive movement of the lever in both directions.

38. In a calculating-machine, an indicator mechanism, comprising rotary drums, means to rotate said drums, a rocking guide for said means, a swinging lever, a disk on the main shaft having laterally-projecting pins, and a double-acting latch on the lever engaged alternately by said pins, and thereby effecting a positive movement of the rocking lever in both directions, substantially as described.

39. In a calculating-machine, an indicator mechanism, comprising rotary drums, means to rotate said drums, a rocking guide for said means, a swinging lever, a disk on the main shaft having laterally-projecting pins, and a double-acting latch on the lever engaged alternately by said pins, and thereby effecting a positive movement of the rocking lever in both directions; with means to throw said latch out of engagement with said pins whenever it is desired to reset the registering-wheels to zero position or to print the total, substantially as described.

709,868. **COMPUTING-MACHINE.** ALEXANDER C. SCHUMAN, Louisville, Ky., assignor to Spalding Coleman, Louisville, Ky. Filed Dec. 18, 1901. Serial No. 86,514. (No model.)



Claim.—1. The combination of a numbered wheel or disk, a vibrating segment adapted to mesh therewith, a lever actuating said segment having a series of stop-lugs, and a series of keys adapted when depressed to engage certain lugs on the lever to limit the movement thereof.

2. The combination of a number-disk, its pinion, a vibrating lever, a segment pivotally connected to the lever, a rock-arm supporting said segment, and means for rocking said arm to throw the segment into mesh with the pinion, substantially as described.

3. The combination of registering-disks having pinions, vibrating levers carrying segments adapted to mesh with the pinions, a rock-shaft beside the levers, cams hung on said shaft and engaging said levers, and keys and connections for limiting the forward movements of the levers.

4. The combination of a number-disk, its pinion, a vibrating lever, a segment pivotally connected to said lever, and means for vibrating said segment on the lever to throw it into and out of mesh with the pinion; with keys for limiting the forward movement of the lever and segment, substantially as described.

5. The combination of a numbered wheel or disk, a vibrating lever, a segment pivotally connected to the lever, a rock-arm supporting said segment, and means for rocking said arm to throw the segment into mesh with the wheel, substantially as described; with a spring for throwing the lever forward, and a rock-shaft having a cam adapted to engage and retract the lever, substantially as described.

6. The combination of toothed disks, vibrating levers carrying segments adapted to mesh with the disks, a rock-shaft beside the levers, cams hung on said shaft and engaging said levers, and keys and connections for limiting the forward movements of the levers; with means for throwing the segments into mesh with the disks on the return stroke of the levers, substantially as described.

7. The combination of toothed number wheels or disks, vibrating segments adapted to mesh therewith and key-controlled means for limiting the forward movements of said segments; with means for throwing said segments into mesh with the wheels on either stroke at will, substantially as described.

8. The combination of a vibrating lever, a catch for holding said lever in normal position, keys for limiting the forward movement of the lever, the key lock-bar adapted to be shifted by the depression of a key, connections between said lock-bar and said catch whereby the catch is caused to release the lever when the key is depressed, substantially as described.

9. The combination of the toothed number-wheels, the segment adapted to mesh therewith, the rocking arm slidably supporting the front end of the segment, the vibrating lever pivotally connected to the rear end of the segment, and means for rocking said arm and vibrating said lever, for the purpose and substantially as described.

10. The combination of the toothed number-wheels, vibrating segments adapted to mesh therewith, and rocking arms for throwing said segments into and out of mesh; with the auxiliary tripping devices beside the wheels whereby when a number is to be carried over from one wheel to the next, the arm of said next wheel is automatically locked long enough to make its segment move the wheel, substantially as described.

11. The combination of toothed number-disks, vibrating segments adapted to mesh therewith, key-controlled means for limiting the forward movements of said segments, and means for throwing said segments into mesh with the disks on one stroke, and dropping them out of mesh on the termination of such stroke; with means whereby said segments may be thrown into and held in mesh with the wheels on both strokes, substantially as described.

12. The combination of the vibrating lever, the vibrating catch for holding said lever in normal position, the dog pivoted to said catch, the keys for limiting the forward movement of the levers, the key lock-bar adapted to be shifted by the depression of a key, connections between said lock-bar and said catch whereby the catch is caused to release the lever when the key is depressed, and a pin on the lever adapted to engage the dog on the catch and cause the latter to shift the key lock-bar and reset the keys, substantially as described and for the purposes set forth.

13. The combination of the registering-disks, vibrating segments adapted to mesh therewith, rocking arms supporting said segments and means for rocking said arms to throw the segments in mesh; with levers pivoted beside the disks adapted to be rocked by contact with "carrying-lugs" thereon, each lever having an arm depending beside the rocking arm supporting the segment and adapted when the lever is tripped by a carrying-lug to hold said arm up in position to keep the segment in mesh.

14. The combination of registering or number wheels or disks, vibrating segments adapted to mesh therewith, and devices for setting and holding said segments in mesh; with levers suspended beside the disks each having an arm adapted to be engaged by the "carrying-lug" of one disk, and another arm adapted to engage the segment-setting devices of an adjoining disk and keep the segment in mesh until the "carrying over" is effected; and means for returning the lever to normal position after each operation, substantially as described.

15. The combination of number wheels or disks, the vibrating seg-

ments adapted to mesh therewith, and devices for setting and holding said segments in mesh on one stroke; with levers suspended beside the disks, each having an arm adapted to be engaged by the "carrying-lug" of one disk, and another arm adapted to engage the segment-setting devices of an adjoining disk and keep such segment in mesh until the "carrying over" is effected, a dog for locking the levers during the "carry-over" operation, and means for returning the dog and lever to normal position after such operation, substantially as described.

16. In an adding-machine, the combination of a series of registering or number wheels, a corresponding series of vibrating segments, and levers supporting said segments; with a series of rocking cams beside the levers, each having a cam-slot engaged by a pin on the adjoining lever, and means for returning said cams and levers to normal position, substantially as described

17. The combination of a series of registering disks or wheels, a series of vibrating segments, levers supporting said segments, a cam-plate loosely mounted beside each lever having a cam-slot engaging the adjoining lever, springs for throwing the cams and levers forward when the levers are released, and means for returning all the cam-plates, and levers, to normal position, the slots in the several cam-plates having dwells of successively greater length so that the levers will move the distance of the last tooth or notch of their return stroke in succession.

18. The combination of a series of registering disks or wheels, a series of vibrating segments, levers supporting said segments, a cam-plate loosely mounted beside each lever having a cam-slot engaging the adjoining lever, springs for throwing the cams and levers forward when the levers are released and means for returning all the cam-plates, and levers, to normal position, the slots in the several cam-plates having dwells of successively greater length so that the levers will move the distance of the last tooth or notch of their return stroke in succession; with means for throwing the segments into mesh with the wheel on their return stroke, and disengaging them from the wheels just before the completion of such stroke thereof, substantially as described.

19. In an adding-machine, the combination of a series of registering or number wheels, a corresponding series of vibrating segments, levers supporting said segments; with a rock-shaft beside the levers, a series of cam-plates, one for each lever, loosely mounted on said rock-shaft, each having a cam-slot engaged by a pin on the adjoining lever and springs for turning said cam-plates forward on the shaft when the levers are released, and means for returning said cams and levers to normal position, substantially as described.

20. The combination of a series of registering disks or wheels, a series of vibrating segments, levers supporting said segments, a rock-shaft beside the levers, a cam-plate loosely mounted on the rock-shaft beside each lever and having a cam-slot engaging the adjoining lever, springs for throwing the cams and levers forward when the levers are released, and a stop on the rock-shaft for returning all the cam-plates and levers to normal position, the slots in the several cam-plates having dwells of successively greater length so that the levers will move the distance of the last tooth or notch of their return stroke in succession, instead of simultaneously.

21. The combination of a series of registering disks or wheels, a series of vibrating segments, levers supporting said segments, a cam-plate loosely mounted beside each lever having a cam-slot engaging the adjoining lever, springs for throwing the cams and levers forward when the levers are released, and means for returning all the cam-plates, and levers, to normal position, the slots in the several cam-plates having dwells of successively greater length so that the levers will move the distance of the last tooth or notch of their return stroke in succession; with means for throwing the segments into mesh on one stroke with the wheels, and disengaging them from the wheels just before the completion of the return stroke, and auxiliary devices for keeping the segments in mesh during the final or "carry-over" movement in such return stroke, substantially as described.

22. The combination of a series of registering disks or wheels, a series of vibrating segments, levers supporting said segments, a rock-shaft beside the levers, a cam-plate loosely mounted on the rock-shaft beside each lever and having a cam-slot engaging the adjoining lever, springs for throwing the cams and levers forward when the levers are released, and a stop on the rock-shaft for returning all the cam-plates, and levers, to normal position, the slots in the several cam-plates having dwells of successively greater length so that the levers will move the distance of the last tooth or notch of their return stroke in succession, instead of simultaneously; with means for throwing the segments into mesh on one stroke with the wheels, and disengaging them from the wheels just before the completion of the return stroke, and auxiliary devices for keeping the segments in mesh during the final or "carry-over" movement of each return stroke, substantially as described.

23. The combination of a registering wheel or disk, a vibrating segment, a rock-shaft and connections for vibrating the segment; with a rocking arm supporting the segment, and a lever for rocking said arm to throw the segment in mesh with the wheel.

24. The combination of the registering wheels or disks, the vibrating segments for actuating the disks, a rock-shaft and connections for vibrating the segments, a series of catches for holding the segments in normal position; and a lever and connections for throwing the segments into mesh with the wheels substantially as described.

25. The combination of the registering wheels or disks, the vibrating levers, a rock-shaft and connections for operating said levers, key-controlled catches for said levers, and keys adapted when depressed to release the catches and limit the movement of the levers, and the segments pivoted to the levers adapted to be thrown into mesh with the wheels; a second rock-shaft, arms thereon supporting said segments and adapted to throw them into or out of mesh with the wheels; and a lever and connections for rocking said shaft from the first rock-shaft, all substantially as described.

26. The combination of a registering wheel or disk, a vibrating segment, keys for regulating the extent of movement thereof, and a rock-shaft and connections for vibrating the segment; with a rocking arm supporting the segment, a lever for rocking said arm to throw the segment in mesh with the wheel, and a cam on the rock-shaft for operating said lever, substantially as described.

27. The combination of the registering wheels or disks, the vibrating segments for actuating the disks, a series of catches for holding the segments in normal position, and a lever and connections for throwing the segments into mesh with the wheels; with a total-key and devices operated by the depression of said key whereby said lever is caused to throw and hold the segments in mesh, and whereby the segment-catches are simultaneously disengaged therefrom, substantially as described.

28. The combination of the registering wheels or disks, the vibrating levers, a rock-shaft and connections for operating said levers, key-controlled catches for said levers, keys adapted when depressed to release the catches and limit the movement of the levers, and segments pivoted to the levers adapted to be thrown into mesh with the wheels; a second rock-shaft, arms thereon supporting said segments and adapted to throw them into or out of mesh with the wheels, and a lever and connections for rocking said shaft from the first rock-shaft; with a key and connections whereby upon the depression of said key said segments are thrown and held in mesh with the gears and simultaneously the catches disengaged from the segments, substantially as described.

29. The combination of the registering-wheels, the oscillating segments for operating the wheels, and the vibrating levers operating said segments; with the plates pivoted beside the levers, the dogs on the levers engaging said plates to operate them when the levers move forwardly, and the type-bars moved by said plates, substantially as described.

30. The combination of the registering wheels or disks, the oscillating segments for operating the wheels, the vibrating levers operating said segments, the oscillating type-bars, mediate mechanism for shifting said bars from the levers, and impression-hammers and connections for setting the hammers upon the forward movement of the levers, and for releasing the hammers upon the return of the levers substantially as described.

31. The combination of the registering-wheels, the oscillating segments for operating the wheels, vibrating levers operating said segments, and the plates pivoted beside the levers; with dogs on the levers engaging said plates, the type-bars moved by said plates, and the stop-bars adapted to hold the dogs away from the plates on the return stroke of the levers.

32. The combination of the registering wheels or disks, the oscillating segments for operating the wheels, the vibrating levers operating said segments, the oscillating type-bars, mediate mechanism for shifting said bars from the levers, impression-hammers and connections for setting the hammers upon the forward stroke of the levers and releasing them upon the return of the levers substantially as described.

33. The combination of a series of registering-disks, a corresponding series of vibrating segments, levers supporting said segments, and means for throwing said segments into and out of mesh with the disks on either stroke thereof, substantially as described.

34. The combination of a series of registering-disks, a corresponding series of segments, means for vibrating said segments, and means for throwing them into and out of mesh with the disks; with means whereby the segments are moved simultaneously on their forward strokes, and means for causing them to complete their return strokes successively, substantially as described.

35. The combination of registering-wheels, oscillating levers and connections for shifting said wheels, the movable type-bars operated from said levers, the type-hammers opposite the bars, means for setting the hammers on the forward stroke of the levers, the dogs engaging the hammers, and connections whereby the levers cause the dogs to release the hammers, substantially as described.

36. The combination of the registering-wheels, the segments for operating the wheels, vibrating levers operating said segments, the swinging type-bars actuated from the levers, and means for locking said type-bars after the levers have made their forward stroke; with means for taking a record from the type upon the return stroke of the levers and subsequently restoring the parts to normal position, substantially as described.

37. The combination of a series of registering-disks, a corresponding series of vibrating segments, levers supporting said segments, and means for throwing said segments into and out of mesh with the disks; with means whereby the segments are caused to end their return strokes in succession, substantially as described.

38. The combination of a series of registering-disks, a corresponding series of segments, levers and connections for vibrating said segments, and means for throwing said segments into and out of mesh with the disks; with means whereby the segments are moved simultaneously on their forward strokes, means for bringing them into mesh on their return strokes, and means for causing them to complete their return strokes successively.

39. The combination of the registering-wheels, the oscillating levers and connections for shifting said wheels; the movable type-bars operated from said levers, the type-hammers opposite the bars, springs for actuating said hammers, the dogs engaging the hammers, and the pull-rods and connections whereby the levers cause the dogs to release the hammers, substantially as described.

40. The combination of the registering-wheels, the segments for operating the wheels, vibrating levers operating said segments, plates loosely pivoted beside the levers, dogs on the levers adapted to engage the plates when the levers move forwardly, the type-bars actuated from the plates, and means for locking said type-bars after the levers have made their forward stroke; with means for taking a record from the type, and means for subsequently restoring the parts to normal position, substantially as described.

41. The combination of the registering mechanism, the movable type-bars, and mechanism for shifting said bars by and from such registering mechanism; with a spring-actuated hammer opposite each type-bar, means for setting the hammers upon the actuation of the registering mechanism, means for feeding a strip of paper between the hammers and type-bars, and means for releasing the hammers to take an impression at each operation of the registering mechanism, substantially as described.

42. The combination of the registering-wheels, oscillating segments meshing therewith, and vibrating levers for actuating said segments; with plates pivoted beside said levers, movable type-bars connected to said plates, the dogs pivoted to the levers for engaging said plates, and the stop-bar for holding said dogs out of engagement with the plates in the normal position of the parts, substantially as described.

43. The combination of the registering-wheels, oscillating segments meshing therewith, and vibrating levers for actuating said segments; with plates pivoted beside said levers, movable type-bars connected to said plates, the dogs pivoted to the levers for engaging said plates, and the stop-bar for holding said dogs out of engagement with the plates in the normal position of the parts; with a series of spring-actuated impression-hammers, their locking-dogs, the pull-bars for disengaging said dogs adapted to be actuated by the vibrating levers, and means for feeding papers between the hammers and type-bar, all substantially as described.

44. The combination of the registering mechanism, the movable type-bars and mechanism for shifting said bars by and from such registering mechanism; a spring-actuated hammer opposite each type-bar, and means for feeding a strip of paper and an ink-ribbon between the hammers and type-bars; with means substantially as described for locking the type-bars in printing position, means for releasing the hammers to take an impression at each operation of the registering mechanism, and means actuated by the registering mechanism for subsequently resetting the hammers, substantially as described.

45. The combination of the registering-wheels, the oscillating segments meshing therewith, the vibrating levers for actuating said segments, the plates pivoted beside said levers, the movable type-bars connected to said plates, the dogs pivoted to the levers for engaging said plates, the stop-bar for holding said dogs out of engagement with the plates in the normal position of the parts, and means for causing said bar to release the dogs at the initial movement of the plates, substantially as described.

46. The combination of the registering-wheels, the oscillating segments meshing therewith, the vibrating levers for actuating said segments, the plates pivoted beside said levers, the movable type-bars connected to said plates, the dogs pivoted to the levers for engaging said plates, the stop-bar for holding said dogs out of engagement with the plates in the normal position of the parts, and means for causing said bar to release the dogs at the initial movement of the plates; with a series of spring-actuated impression-hammers, their locking-dogs, the pull-bars for disengaging said dogs adapted to be actuated by the vibrating levers, and means for feeding paper between the hammers and type-bars, all substantially as and for the purpose described.

47. The combination of registering mechanism, movable type-bars adapted to be shifted thereby, and means for locking said type-bars when shifted until an impression is taken; with spring-actuated impression-hammers opposite each type-bar, means actuated by the registering mechanism for setting said hammers, dogs for locking the hammers, and devices operated by the registering mechanism for releasing said dogs when an impression is to be taken, the dogs for the hammers of higher denominations being adapted to release hammers of lower denominations, substantially as described.

48. The combination of registering mechanism, a rocking plate operated therefrom, a type-bar suspended by said plate, and means for vibrating the latter; with a lock-bar for holding said type-bar in printing position, and means for shifting said lock-bar, substantially as described.

49. The combination of the registering-wheels, a vibrating lever and connections for operating the same; a vibrating-plate, connections for moving said plate from said lever, and a type-bar suspended from said plate; with an impression-hammer, a dog for locking said hammer, a pull-rod for releasing said dog, and a pin on the lever adapted to actuate said pull-rod, for the purpose and substantially as described.

50. The combination of a lever, a dog thereon, means for vibrating said lever, and a plate pivoted beside the lever having a notch and a tooth adapted to be engaged by said dog; with an arm attached to said plate, a type-bar suspended from said arm, and means for disengaging the dog from the plate when the parts are in normal position.

51. The combination of registering mechanism, a rocking plate operated therefrom, a type-bar suspended by said plate, means for vibrating said plate, a lock-bar for holding said type-bar in printing position, and means for shifting said lock-bar; with an impact-bar supporting the type-bars during impression, and spring-actuated impression-hammers, substantially as described.

52. The combination of the registering-wheels, a vibrating lever and connections for operating the same, a vibrating plate, and connections for moving said plate from said lever, a type-bar suspended from said plate, and means for locking said plate during the taking of an impression; with a spring-actuated impression-hammer, a dog for locking said hammer, a pull-rod for releasing said dog, and a pin on the lever adapted to actuate said pull-rod, for the purpose and substantially as described.

53. The combination of a registering-wheel, a segment adapted to mesh therewith, and a vibrating lever for operating said segment; with a rock-shaft beside the lever, a cam loosely mounted on the shaft, having a slot engaged by a pin on the lever, a spring connecting the cam to the shaft, and a stop-bar for returning the cam to normal position.

54. The combination of the depressible keys, with a vibrating lever thereunder having an enlarged head and lateral lugs on the head adapted to contact with the ends of depressed keys, substantially as described.

55. The combination of a registering-wheel, a segment adapted to mesh therewith, and a vibrating lever for operating said segment having an elongated head and laterally-projecting lugs thereon arranged at different distances from the pivot of the lever; with a rock-shaft beside the lever, a cam loosely mounted on the shaft having a slot engaged by a pin on the lever, a spring connecting the cam to the shaft, and the depressible keyed stops adapted to engage the lugs on the lever-head, substantially as described.

56. The combination of the keys and key lock-bar, the vibrating lever, a vibrating catch for said lever, and connections between said catch and lock-bar whereby the catch is caused to release the lever when a key is depressed; with a dog A' pivoted to the end of the catch and adapted to be actuated by the lever on the return stroke thereof to cause the key lock-bar to release the keys, substantially as and for the purpose described.

57. The combination of a vibrating lever, stop-keys for limiting the calculating movement of said lever, the key lock-bar, the lever-catch indirectly connected to said lock-bar and adapted to allow a limited movement of the lever when no key is depressed and to release the lever when a key is depressed, and whereby when the lever returns to normal position the lock-bar is moved and the keys reset.

58. The combination of a vibrating lever, stop-keys for limiting the calculating movements of said lever, a key lock-bar, and a lever-catch connected to said lock-bar, whereby when a key is depressed the lever is released, and when the lever returns to normal position the lock-bar is moved and the keys reset, said catch permitting a carry-over movement of the lever when no key is depressed; with a "repeating-key" and connections whereby the catch may be prevented from releasing the lock-bar at the will of the operator, substantially as described.

59. The combination of the keys and key lock-bar, the vibrating lever, a vibrating catch for said lever, adapted to arrest the latter after it has made a "carry-over" stroke, and connections between said catch and

lock-bar whereby the catch is caused to release the lever and permit further movement thereof when a key is depressed.

60. The combination of a toothed number-disk mounted on a laterally-immovable support or shaft, a vibrating segment, means for throwing the segment into mesh with the disk upon its return stroke, and disengaging it therefrom near the termination of such stroke, and means for positively returning said segment to normal position.

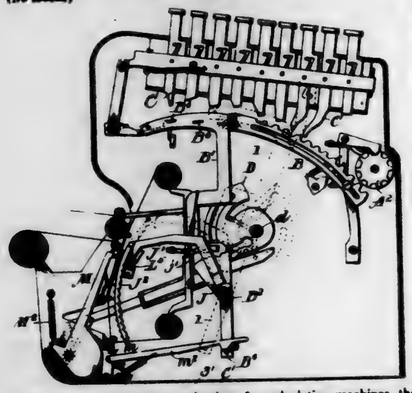
61. The combination of a numbered wheel, a key-controlled longitudinally-vibrating segment, and means for moving the segment laterally toward or from the wheel, adapted to throw the segment into mesh with the wheel upon its return stroke, and to disengage it from the wheel near the termination of such stroke; with a rock-shaft and connections for positively returning said segment to normal position.

62. The combination of a numbered wheel or disk, a vibrating lever having a series of stop-lugs, and a series of keys adapted when depressed to engage certain lugs on the lever to limit the movement thereof; with a segment actuated by said lever and means for holding the segment out of mesh with the wheel on its forward stroke, and for bringing it into mesh therewith on its return stroke, substantially as described.

63. The combination of register devices, movable type-bars adapted to be shifted by the register-actuating mechanism, and means for locking said type-bars when shifted until an impression is taken; with a spring-actuated impression-hammer opposite each type-bar, means actuated by the register-actuating mechanism for setting said hammers, dogs for locking the hammers, and devices operated by the register-actuating mechanism for releasing said dogs when an impression is to be taken, substantially as described.

64. In a register, a vibrating lever having an elongated head and laterally-projecting lugs thereon arranged at different distances from the pivot of the lever, in combination with a key-actuated stop adapted to engage the lugs, substantially as and for the purpose described.

709,364. DATING ATTACHMENT FOR CALCULATING-MACHINES. ALEXANDER C. SCHUMAN, Louisville, Ky., assignor to Spalding Coleman, Louisville, Ky. Filed Jan. 30, 1902. Serial No. 91,934. (No model.)



Claim.—1. In a dating mechanism for calculating-machines, the combination of vibrating levers, means for arresting the forward movement of said levers, type-bearers operated by and from said levers bearing types respectively for months and number of days of months; means for arresting said type-bearers when in printing position until an impression is taken therefrom, means for returning the levers to normal position, and for returning the type-bearers to normal position after the printing is effected, substantially as described.

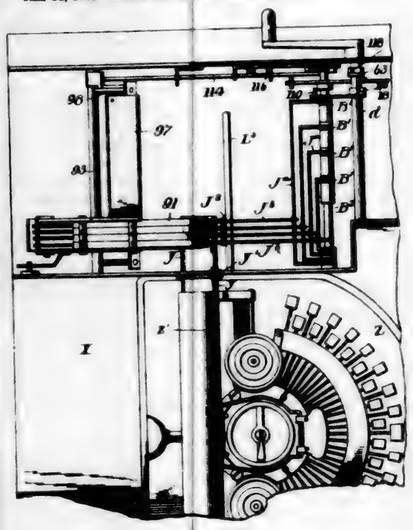
2. In a dating mechanism for calculating and tabulating machines, the combination of three vibrating levers, sets of keyed stops for limiting the forward movement of said levers, one having twelve keys, another three, another ten; type-bearers connected to and operated by said levers respectively bearing type for the twelve months, three numerals and ten numerals, means for taking an impression from the type and for releasing the type-bearers after the impression is taken, substantially as described.

3. In a dating mechanism for tabulating and calculating machines, the combination with the calculating, tabulating and printing mechanism thereof, of a dating mechanism comprising vibrating levers, keys controlling the movements of the same, type-bearers having type for the months and days respectively actuated by and from said levers, means for locking said bearers until an impression is taken from the type thereon, and means for taking an impression from the dating-type bearers simultaneously with impressions from the tabulating-type, substantially as described.

4. A dating mechanism comprising vibrating levers, keys for controlling the movements of the levers, vibrating arms actuated by the forward movement of the levers, type-bearers actuated by said arms, means for locking said bearers until an impression is taken from the type thereon, and means for releasing the type-bearers after impression and means for returning the levers to normal position, substantially as described.

5. The combination with the calculating, tabulating and printing mechanism of a calculating-machine, of a dating mechanism comprising vibrating levers, keys for controlling the forward movements of the levers, vibrating arms actuated by the forward movement of the levers, type-bearers actuated by said arms, means for locking said bearers until an impression is taken from the type thereon, and means for releasing the type-bearers after impression, substantially as described.

709,365. CALCULATING-MACHINE. ALEXANDER C. SCHUMAN, Louisville, Ky., assignor to Spalding Coleman, Louisville, Ky. Filed Jan. 30, 1902. Serial No. 91,935. (No model.)



Claim.—1. The combination of the vibrating levers of a calculating-machine, and means for arresting the movements of said levers, the bars connected with and oscillated by said levers and extending laterally to the side of the calculating-machine, and the type-carriers connected to the outer ends of said extended bars and actuated thereby, and means for taking an impression from the type on said bars, substantially as described.

2. The combination of the vibrating levers of a calculating-machine, and key-controlled means for varying the movements of said levers, laterally-extending bars connected with and oscillated by said levers, the arms attached to the outer ends of said bars, the type-bars pivotally attached to and suspended from said arms, a paper-carriage, and means for taking an impression from the type on said bars upon the paper held by the carriage, substantially as described.

3. In a calculating and tabulating machine, the combination of the printing mechanism located at one side of the machine; with an exterior type-writing machine beside the calculating-machine, having a longitudinally-movable paper-carriage adjacent to the printing mechanism and adapted to present the paper to the said printing mechanism, substantially as described.

4. In a printing mechanism for calculating-machines, the combination of oscillating levers, the vibrating type carriers or bars actuated thereby, a type-writing machine beside said calculating-machine having a movable paper-holding carriage adapted when moved to one position to present the margin of the paper to the printing mechanism to receive impressions therefrom, substantially as described.

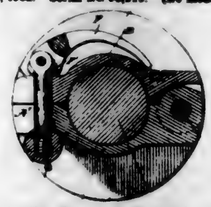
5. In a printing mechanism for calculating-machines, the combination of the oscillating levers, the type-bars actuated thereby, the inking-ribbon, the impression-hammers opposite said bars, and a type-writing machine beside the calculating-machine having a movable paper-holding carriage adapted to present the margin of the paper to the printing mechanism to receive impression therefrom, substantially as described.

6. In a printing mechanism for calculating-machines, the combination of vibrating levers, keyed stops for limiting the movement of said levers, the laterally-extending bars attached to and operated by the levers, the type-bars connected with and actuated by said bars, the impression-hammers, and means for actuating said hammers; with a type-writing machine beside the calculating-machine having a laterally-movable paper-carriage adapted to present the margin of a sheet of paper between the hammers and type-bars, substantially as described.

7. In a combined calculating and type-writing machine, the combination of the vibrating levers, means for vibrating said levers, keyed stops for limiting the movement of said levers, laterally-extending U-shaped bars attached to and operated by the levers, the arms attached to the outer ends of said bars, the type-bars pivotally attached to and suspended from said arms, the impression-hammers, and means for actuating said hammers; with a type-writing machine adjacent to the type-bars having a laterally-movable paper-carriage adapted to present the margin of a sheet of paper between the hammers and type-bars, substantially as described.

8. In a printing mechanism for calculating-machines, the combination of vibrating levers, keyed stops for limiting the movement of said levers, the bars attached to and operated by the levers and extended laterally to one side of the machine, the type-bars connected with the outer ends of and actuated by said bars, the impression-hammers, and means for actuating said hammers; with a type-writing machine beside the calculating-machine having a longitudinally-reciprocating paper-feed carriage, adapted to present the paper to the printing mechanism and hold the same in position during the taking of an impression thereon by the latter, all substantially as and for the purpose described.

709,366. SPLIT COLLAR. ERNEST H. SEXTON, Sandyhill, N. Y. Filed Jan. 21, 1902. Serial No. 90,619. (No model.)



Claim.—1. A split collar, comprising members hinged together one of the members being provided with a recess in its periphery, a link pivotally connected with the free end of one of the members, and a cam-lever fulcrumed on the free end of the link and adapted to engage a surface on the other member and to lie within the recess thereof, as set forth.

2. A split collar, comprising flanged members hinged together, a link pivotally connected with one member and adapted to extend between the flanges of the members, and a cam-lever fulcrumed on the link and adapted to engage a lug on the other member, the said lever when closed extending between the flanges of the member having the said lug, as set forth.

3. A split collar, comprising members hinged together, a link adapted to be lengthened or shortened and having a ball-and-socket connection with the free end of one of the said members, and a cam-lever fulcrumed on the free end of the said link and adapted to engage the free end of the other member, as set forth.

4. A split collar, comprising members hinged together, a ball mounted in a socket in one member and having a screw-threaded socket, a link screwing into the ball, and a cam-lever pivoted to the free end of the link and adapted to engage a lug on the other member, as set forth.

709,367. SURGICAL INSTRUMENT. RICHARD H. SIMPSON, Turnersville, Tex. Filed Nov. 29, 1901. Serial No. 84,095. (No model.)

Claim.—1. A surgical instrument formed to coöperate with sutures in drawing and holding together the edges of a wound, rupture or laceration, and comprising a stiff open suture-receiving frame formed to rest against the lacerated portion surrounding the cut and with the lacerated edges exposed in the opening of the frame, so that the sutures can be stretched transversely around the frame from one side of the laceration to the other, for the purpose stated, the frame having transverse suture-holding notches along the outer edges of the opposite longitudinal portions.

2. In a device of the character described, the combination of a member having adjacent parallel angular portions; and a member having adjacent curved portions lying in parallel planes; the members being secured together at one extremity and inclosing a free open space substantially triangular in outline.

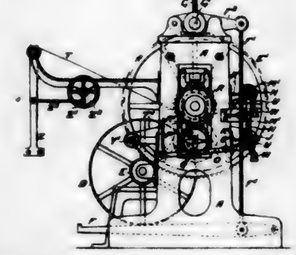
3. In a device of the character described, the combination of a member having adjacent parallel angular portions; and a member having adjacent curved portions lying in parallel planes; the members being adjustably secured together at one extremity and inclosing a free open space substantially triangular in outline.

4. In a device of the character described, the combination of a member having adjacent parallel angular portions; and a member having adjacent curved portions lying in parallel planes; the several portions having notches in their outer sides; the members being secured together at their extremities.

5. In a device of the character described, the combination of a member having adjacent angular portions; and a member having adjacent curved portions; each of the curved portions lying in the same plane with one of the angular portions; the members being secured together at one extremity and inclosing a free open space substantially triangular in outline.

6. In a device of the character described, the combination of a member having adjacent parallel angular portions, and a member having adjacent portions lying in parallel planes; each of the curved portions lying in the same plane with one of the angular portions; the members being secured together at their extremities.

709,368. MACHINE FOR PRODUCING WATER-MARKS ON FABRICS. EDWARD SMITH, Bradford, England. Filed May 13, 1902. Serial No. 107,114. (No model.)



Claim.—1. In combination in a machine for squeezing cloths, two smooth-surfaced rolls, a pair of cloth-carrying beams from which the cloths in duplicate pass between the rolls and means for reciprocating one of said beams longitudinally substantially as described.

2. In combination, a pair of smooth-surfaced rolls, a pair of cloth-carrying beams to deliver the cloths to the rolls in duplicate, a changeable tappet, means for driving the same and lever connections between the tappet and one of the beams for giving the same a longitudinal displacement substantially as described.

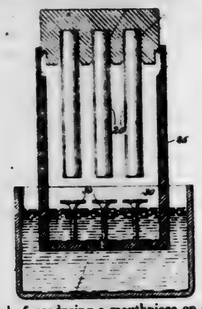
3. In combination, the smooth-surfaced rolls, a pair of cloth-carrying beams, each capable of longitudinal displacement and means for reciprocating the same reversely to each other, substantially as described.

4. In combination, the smooth-surfaced rolls, a pair of cloth-carrying beams, each capable of longitudinal displacement and means for reciprocating the same reversely to each other, said means comprising a tappet, a lever O operated thereby, levers M M' at the opposite ends of the rolls and arranged to engage the axle of each and the link connection from the lever O to the lever M' for operating the same, substantially as described.

709,369. METHOD OF PRODUCING MOUTHPIECES ON CIGARETTES. LEWIS E. SONDHEIM, New York, N. Y. Filed Jan. 31, 1902. Serial No. 91,967. (No specimens.)

Claim.—1. The method of producing a mouthpiece on an open-ended cigarette, consisting in applying to an end thereof a temporary covering which is separate from the cigarette, then applying to the cigarette-wrap-

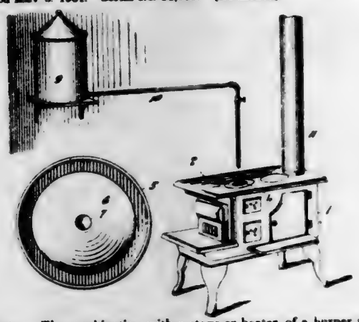
per while the covering is in place thereon, a substance which will harden on the wrapper and form a mouthpiece, and then removing the temporary covering.



2. The method of producing a mouthpiece on an open-ended cigarette, consisting in covering the cigarette end and moistening the end of the wrapper, applying to said wrapper a substance which will harden thereon, and then removing the covering.

3. The method of forming a mouthpiece on an open-ended cigarette, consisting in applying to an end of the cigarette a closure-plate, dipping the cigarette, with the closure-plate in place, into a substance which will harden on the cigarette-wrapper, withdrawing from the substance the cigarette with the closure-plate in place, and then removing said plate from the cigarette.

709,870. **OIL-BURNER.** ELMORE STEWART, Los Angeles, Cal. Filed May 6, 1901. Serial No. 58,963. (No model.)



Claim.—The combination with a stove or heater, of a burner movable from place to place in the stove or heater, the said burner consisting of a cup-shaped body having a conical bottom closure provided with a depression at its apex, the said apex being below the open top of the body, an oil-supply tube arranged above the stove or heater and in line with said depression, and a downdraft-tube supported independently of and wholly above the burner, substantially as specified.

709,871. **STEAM-GENERATOR.** PETER STOLTZ, Berlin, Germany. Filed Oct. 26, 1901. Serial No. 80,086. (No model.)

Claim.—1. A steam-generator, comprising vaporizing-chambers, each consisting of a single plate of metal provided with oppositely-disposed pairs of convex ribs extending from edge to edge of said plate, and with longitudinal passages concentric with said convex ribs and extending centrally through said plate substantially from edge to edge thereof, and also provided with short passages connecting said longitudinal passages.

2. A steam-generator, comprising vaporizing-chambers, each consisting of a single plate of metal provided with oppositely-disposed pairs of convex ribs extending longitudinally from edge to edge of said plate, and with longitudinal cylindrical passages concentric with said convex ribs, said plate being further provided with means for allowing intercommunication between said longitudinal passages at points adjacent to the ends thereof.

3. A steam-generator, comprising vaporizing-chambers each consisting of a single plate of metal provided with oppositely-disposed pairs of convex ribs integrally connected together, and also provided with longitudinal passages disposed closely together, said longitudinal passages being connected together by short passages extending directly through the substance of the plate, whereby the tendency toward leakage is greatly lessened and a structure of great strength is produced.

4. A steam-generator, comprising vaporizing-chambers each consisting of a plate of metal provided with longitudinal passages extending throughout the substance of said plate substantially from edge to edge thereof, and a plurality of hollow tubes disposed within said longitudinal passages and fitted steam-tight into the respective ends thereof, said hollow tubes at points intermediate of said ends being concentrically spaced within said passages, thereby forming steam-spaces each of a general tubular form, said plate being further provided with means for maintaining communication between said steam-spaces.

709,872. **COMBUSTION PROCESS.** JAMES TATHAM, Philadelphia, Pa. Filed Oct. 11, 1901. Serial No. 78,544. (No specimens.)

Claim.—1. The mode herein described of effecting combustion of carbonaceous fuel, said mode consisting in causing gases of combustion to pass from an incandescent portion through a non-incandescent portion of one part of a mass of fuel, and then causing these gases to traverse in like sequence another part of said mass, substantially as specified.

2. The mode herein described of effecting combustion of carbonaceous fuel, said mode consisting in creating a downdraft through one part of a mass of fuel by means of a current of air, thereby causing gases of combustion to pass from an incandescent portion through a non-incandescent portion of this part of the mass of fuel, and then passing said gases in like sequence through another part of said mass, substantially as specified.

3. The mode herein described of effecting combustion of carbonaceous fuel, said mode consisting in creating a downdraft through one part of a mass of fuel by means of a current of preheated air, thereby causing gases of combustion to pass from an incandescent portion through a non-incandescent portion of this part of the mass of fuel, and then passing said gases in like sequence through another part of said mass, substantially as specified.

4. The mode herein described of effecting combustion of carbonaceous fuel, said mode consisting in creating a downdraft through one part of a mass of fuel by means of a current of air, thereby causing gases of combustion to pass from an incandescent portion through a non-incandescent portion of this part of the mass, then passing these gases in like sequence through another part of the said mass of fuel, and finally passing the resulting ignited gases over that part of the mass of fuel in which the downdraft is maintained, substantially as specified.

5. The mode herein described of effecting combustion of carbonaceous fuel, said mode consisting in creating a downdraft through one part of a mass of fuel by means of a current of preheated air, thereby causing gases of combustion to pass from an incandescent portion through a non-incandescent portion of this part of the mass, then passing these gases in like sequence through another part of the said mass of fuel, and finally passing the resulting ignited gases over that part of the mass of fuel in which the downdraft is maintained, substantially as specified.

6. The mode herein described of effecting combustion of carbonaceous fuel, said mode consisting in causing gases of combustion to pass from an incandescent portion through a non-incandescent portion of part of a mass of fuel, mixing the gases thus produced with air and then causing the mixture to traverse in like sequence another part of the mass of fuel, substantially as specified.

7. The mode herein described of effecting combustion of carbonaceous fuel, said mode consisting in creating a downdraft through one part of the mass of fuel by means of a current of air, thereby causing gases of combustion to pass from an incandescent portion through a non-incandescent portion of this part of the mass, mixing the gases thus produced with air and then passing the mixture in like sequence through another part of the mass of fuel, substantially as specified.

8. The mode herein described of effecting combustion of carbonaceous fuel, said mode consisting in creating a downdraft through one part of the mass of fuel by means of a current of preheated air, thereby causing gases of combustion to pass from an incandescent portion through a non-incandescent portion of this part of the mass, mixing the gases thus produced with air and then passing the mixture in like sequence through another part of the mass of fuel, substantially as specified.

9. The mode herein described of effecting combustion of carbonaceous fuel, said mode consisting in creating a downdraft through one part of the mass of fuel by means of a current of air, thereby causing gases of combustion to pass from an incandescent portion through a non-incandescent portion of the mass, mixing the gases thus produced with air, then passing the mixture in like sequence through another part of the said mass of fuel, and finally passing the resulting ignited gases over that part of the mass of fuel in which the downdraft is maintained, substantially as specified.

10. The mode herein described of effecting combustion of carbonaceous fuel, said mode consisting in creating a downdraft through one part of the mass of fuel by means of a current of preheated air, thereby causing gases of combustion to pass from an incandescent portion through a non-incandescent portion of this part of the mass, mixing the gases thus produced with air, causing the mixture to traverse in like sequence another part of the said mass of fuel and finally passing the resulting ignited gases over that part of the mass of fuel in which the downdraft is maintained, substantially as specified.

11. The mode herein described of effecting combustion of carbonaceous fuel, said mode consisting in causing gases of combustion to pass from an incandescent portion of one part of the mass of fuel through a non-incandescent portion thereof, mixing the gases thus produced with preheated air and causing the mixture to traverse in like sequence another part of the mass of fuel, substantially as specified.

12. The mode herein described of effecting combustion of carbonaceous fuel, said mode consisting in creating a downdraft through one part of the mass of fuel by means of a current of air, thereby causing gases of combustion to pass from an incandescent portion through a non-incandescent portion of this part of the mass, mixing the gases thus produced with preheated air, and causing the mixture to traverse in like sequence another part of the mass of fuel, substantially as specified.

13. The mode herein described of effecting combustion of carbonaceous fuel, said mode consisting in creating a downdraft through one part of the mass of fuel by means of a current of preheated air, thereby causing gases of combustion to pass from an incandescent portion through a non-incandescent portion of this part of the mass, mixing the gases thus produced with preheated air, and causing the mixture to traverse in like sequence another part of the mass of fuel, substantially as specified.

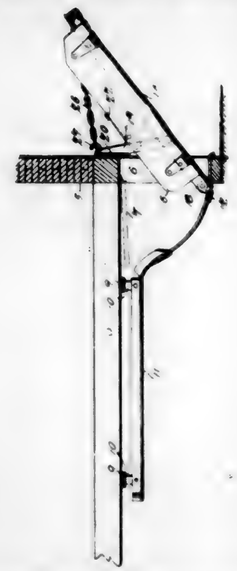
14. The mode herein described of effecting combustion of carbonaceous fuel, said mode consisting in creating a downdraft through one part of the mass of fuel by means of a current of air, thereby causing the gases of combustion to pass from an incandescent portion through a non-incandescent portion of this part of the mass, mixing the gases thus produced with preheated air, causing the mixture to traverse in like sequence another part of the said mass of fuel, and then passing the resulting ignited gases over that part of the mass in which the downdraft is maintained, substantially as specified.

15. The mode herein described of effecting combustion of carbonaceous fuel, said mode consisting in creating a downdraft through one part of the mass of fuel by means of a current of preheated air, thereby causing gases of combustion to pass from an incandescent portion through a non-incandescent portion of this part of the mass, mixing the gases thus produced with preheated air, causing the mixture to traverse in like sequence another part of the said mass of fuel, and then passing the resulting ignited gases over that part of the mass in which the downdraft is maintained, substantially as specified.

709,873. **COAL-CHUTE.** WILLIAM H. TAYLOR, Kewanee, Ill. Filed Mar. 1, 1902. Serial No. 96,305. (No model.)

Claim.—1. A coal-chute comprising a bottom portion and side portions pivoted to the edges of the bottom and adapted to be folded down thereon when not in use.

2. The combination with a chute comprising a bottom portion, side portions hinged to the edges of the bottom and adapted to be folded down thereon when not in use, rollers carried by the bottom portion of the chute, and supporting and guiding tracks on which said rollers may travel.



3. The combination with the supporting and guiding rails extending from a window-sill and having a storage portion arranged adjacent to a ceiling, of a coal-chute comprising a bottom portion and folding sides, and rollers extending from the bottom portion and adapted to rest on the rails.

4. A folding chute comprising a body or bottom portion, side portions hinged thereto, and a pivoted guard.

5. A folding chute comprising a body or bottom portion, folding sides, a pivoted guard, and means for interlocking the guard and sides.

6. A folding chute comprising a body or bottom portion, folding sides, a pivoted guard, and dogs pivotally connected to the sides and adapted to interlock the sides and the guard.

7. In a device of the class specified, guiding-rails extending from a window-sill and adapted to form a guiding and a storage support for a coal-chute, supporting-lugs carried by the tracks, a folding chute adapted to be supported by the lugs when in operative position, and auxiliary supporting devices for retaining the chute in operative position.

8. In a device of the class specified, guiding-rails extending from a window-sill and adapted to form a guiding and a storage support for a coal-chute, supporting-lugs disposed on the track at a point adjacent to said sill, a coal-chute, and supporting devices extending from the forward end thereof to a fixed support.

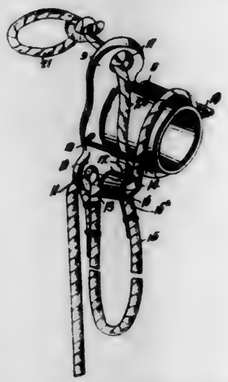
9. In a device of the class specified, guiding-rails extending from a window-sill and adapted to form a guiding and a storage support for a coal-chute, supporting-lugs disposed on the track at a point adjacent to the sill, a coal-chute having rollers adapted to the trackway and the inner end of the chute being supported by said lugs when in operative position, and chains connecting the outer end of the chute to a fixed support.

10. In a device of the class specified, guiding-rails extending from a window-sill and adapted to form a guiding and a storage support for a coal-chute, supporting-lugs disposed on the track at a point adjacent to the sill, a coal-chute having supporting-rollers adapted to the guiding-rails, folding sides and a protecting-shield forming part of said chute, and chains connecting the outer reinforced end of the chute to a fixed support.

709,874. **FIRE-ESCAPE.** WILLIAM H. TAYLOR, Kewanee, Ill. Filed Mar. 1, 1902. Serial No. 96,306. (No model.)

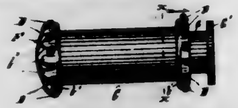
Claim.—1. A fire-escape comprising a brake-drum having a head at one end, with flanges 9, 10, respectively, above and below the drum and perpendicular thereto, said flange 9 having an opening 17, and said flange 10 having an elongated opening 16, substantially parallel with the drum, in combination with a cable passed through the said openings and having one or more turns around the drum, substantially as described.

2. A fire-escape comprising a brake-drum having a head at one end, with flanges 9, 10, respectively, above and below the drum and perpendicular thereto, said flange 9 having an opening 17, and said flange 10 having an elongated opening 16, substantially parallel with the drum, in combination with a cable passed through the said openings and having one or more turns around the drum, and means depending from the flange 10, to sustain the user.



3. A fire-escape comprising a brake-drum having a longitudinal guide-loop on one side thereof, and having a head at one end with flanges, 9, 10, respectively above and below the drum and perpendicular thereto, said flange 9 having an opening 17, and said flange 10 having an elongated opening 16 substantially parallel with the drum, in combination with a cable passed through the said openings and having one or more turns around the drum, within the guide-loop thereof, substantially as described.

709,375. WHEEL-HUB. HORACE B. THAYER, Erie, Pa. Filed July 5, 1902. Serial No. 114,463. (No model.)



Claim.—1. The combination in a wheel-hub of a central thimble, inwardly-headed and outwardly-flanged collars with spoke-openings therein on said thimble, and an outer shell or covering between said collars held in place by the heads thereon, substantially as set forth.

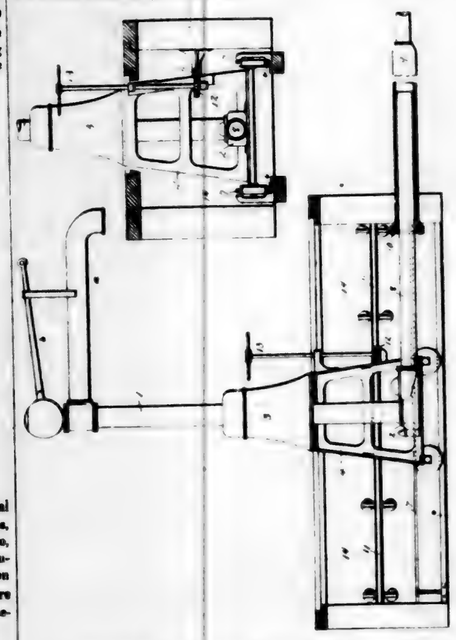
2. The combination in a wheel-hub, of a central thimble, inwardly-headed and outwardly-flanged toothed collars thereon having spoke-openings therein, spokes in the openings of said collars extending through both collars and turned outward between the teeth thereon, a tubular shell between said collars covering the spokes and thimble, and a cap on the outer end of the hub secured in place by turning inward the teeth on the outer hub-collar, substantially as and for the purpose set forth.

3. The combination in a wheel-hub, of a central thimble, a sheet-metal collar having its periphery flanged outward on the outer end of the thimble, and a disk closing the outer end of the hub and secured thereto by bending the flanged portion of the sheet-metal collar down over the periphery of the disk, substantially as set forth.

4. The combination in a wheel-hub of a central thimble A, peripheral projections *a*, thereon, collars B B′ on said thimble, heads *b*′ on their inner faces, outwardly-flanged teeth *b*² on their peripheries and spoke-openings *b* in said collars, spokes D passed through the openings in said collars and bent outward against their outer faces between the peripheral teeth thereon, a shell C covering and inclosing the spokes D between the collars B and B′, a cap F closing the outer end of the hub and secured thereto by bending the teeth down over the periphery of said cap and a flanged sleeve G secured to the inner end of the thimble, substantially as and for the purpose set forth.

709,376. STAND-PIPE FOR RAILWAY USES. JOHN W. THOMAS, Jr., Nashville, Tenn. Filed Jan. 22, 1902. Serial No. 90,333. (No model.)

Claim.—1. A stand-pipe or water-crane for railway uses movable and adjustable bodily lengthwise of the railway-track alongside of which it is located substantially as described.

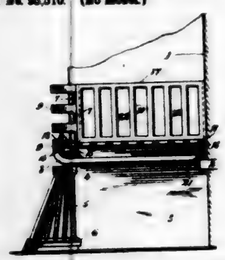


2. A stand-pipe or water-crane for railway uses movable lengthwise of the track alongside of which it is located, and swiveled so as to be capable of axial rotation, substantially as described.

3. A stand-pipe or water-crane for railway uses, movable and adjustable bodily lengthwise of the track alongside of which it is located, in combination with a source of water-supply and extensible connections between the same and the water-crane, substantially as described.

4. A stand-pipe or water-crane for railway uses movable and adjustable bodily lengthwise of the track alongside of which it is located, in combination with a source of water-supply and pressure-equalizing extensible connections between the same and the water-crane, substantially as described.

709,377. GRATE. JOHN T. VADDEN, Griffin, Ga. Filed Feb. 25, 1902. Serial No. 95,510. (No model.)

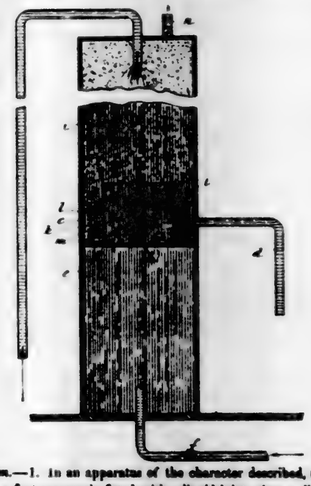


Claim.—A grate, comprising a grate-basket provided with horizontally-arranged longitudinal bars so disposed as to form a substantially flat bottom, and having upturned ends provided with a substantially arc-shaped member integrally mounted thereon, a fuel-rack provided with horizontally-arranged longitudinal bars disposed at right angles to the general direction of the bars of said grate-basket, said fuel-rack being provided at its front portion with upturned lugs for engaging said arc-shaped member, and provided at its back portion with depending lugs, each having a length substantially equal to the general depth of said grate-basket, and a pair of hollow end plates of substantially wedge shape, mounted upon said fuel-rack and provided with vertical slots to afford ventilation.

709,378. VEHICLE-SEAT BRACE. GEORGE W. VIRGIN, Hazlewood, Ky. Filed June 12, 1902. Serial No. 111,330. (No model.)

Claim.—As an article of manufacture, a brace-iron of the character described, consisting of vertical and horizontal flat flanges arranged at right angle one with the other and braced by a web in one piece with said flanges, the lower end of said web being bent at right angle forming a foot and the lower end of the vertical flange extended below said foot adapted to provide additional securing means, substantially as described.

709,379. APPARATUS FOR TREATING LIQUIDS WITH GASES OR GASES WITH LIQUIDS. ALEXANDER VOSMAER, Watergraafmeer, and ADRIAAN LEENST, Utrecht, Netherlands, assignors to Ozon Maatschappy Systeem A. Vosmaer, Amsterdam, Netherlands. Filed Apr. 2, 1902. Serial No. 101,026. (No model.)



Claim.—1. In an apparatus of the character described, the combination of a first receptacle fitted with a liquid-inlet pipe, a liquid-outlet pipe and a separate gas-outlet, a part or second receptacle fitted with a gas-inlet and upon which rests the first receptacle, means for dividing in very small bubbles a gaseous current passing from the second receptacle into the first receptacle, the said means being located between the two receptacles and means for opposing a resistance in the first receptacle to the passage of the gas-bubbles through the liquid-outlet pipe, substantially as and for the purpose described.

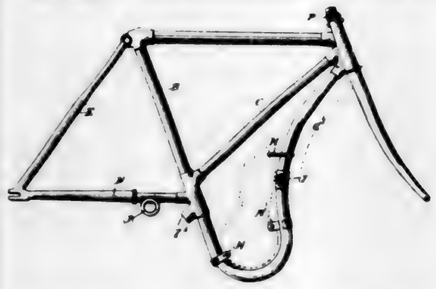
2. In an apparatus of the character described, the combination of a receptacle fitted with liquid inlet and outlet pipes, a gas-inlet pipe and a gas-outlet, a perforated diaphragm placed in the said receptacle between the gas and liquid inlet pipes, the perforations of said diaphragm being of a sufficiently small diameter to prevent the liquid from flowing through said perforations, but allowing the passage of a current of gas under pressure and a resistance placed before the liquid-outlet pipe and preventing the passage of gaseous bubbles through said pipe, substantially as and for the purpose described.

3. In an apparatus of the character described, the combination of a receptacle fitted at its upper part with a liquid-inlet pipe and a gas-outlet and at its lower part with a gas-inlet pipe, a perforated diaphragm placed in said receptacle between the liquid and gas inlet pipes and adapted to prevent the flowing of the liquid through said diaphragm, a liquid-outlet pipe placed near said perforated diaphragm and a perforated screen placed before said liquid-outlet pipe, substantially as described and for the purpose set forth.

4. In an apparatus of the character described, the combination of a receptacle fitted at its upper part with a liquid-inlet pipe and a gas-outlet and at its lower part with a gas-inlet pipe, a perforated diaphragm placed in said receptacle between the liquid and gas inlet pipes and adapted to prevent the flowing of the liquid through said diaphragm, a liquid-outlet pipe placed near said diaphragm, a perforated screen placed before said liquid-outlet pipe and a tubular projection extending from the perforated diaphragm to above the screen of the liquid-outlet pipe, substantially as described and for the purpose set forth.

5. In an apparatus of the character described, the combination of a receptacle fitted at its upper part with a liquid-inlet pipe and a gas-outlet and at its lower part with a gas-inlet pipe, a perforated diaphragm placed in said receptacle between the liquid and gas inlet pipes and fitted with very small perforations adapted to prevent the flowing of the liquid through said diaphragm, a liquid-outlet pipe placed near said perforated diaphragm, a perforated screen forming an annular chamber in which opens said liquid-outlet pipe, the perforations of the said screen being of greater diameter than the perforations of the perforated diaphragm and a tubular projection extending from the perforated diaphragm to above the screen, substantially as described and for the purpose set forth.

709,380. FRAME FOR MOTOR-BICYCLES. GEORGE WAGNER and BURNEY B. REED, St. Paul, Minn. Filed Apr. 5, 1902. Serial No. 101,680. (No model.)



Claim.—1. A motor-cycle frame, having a diamond-shaped body, and an integral loop for supporting the motor, the loop extending below the lower front brace and forming a downward continuation of the center brace, as set forth.

2. A motor-cycle frame, having a diamond-shaped body, and an integral loop for supporting the motor, the loop extending below the lower brace and forming a downward continuation of the center brace, the said loop terminating at its front end in an extension-arm rigidly connected with the steering-head of the said body, as set forth.

3. A motor-cycle frame, having a diamond-shaped body, and an integral loop for supporting the motor, the loop extending below the center brace and forming a downward continuation of the center brace, the said loop being hollow and provided with an inlet and an outlet for the exhaust to pass through the loop, as set forth.

4. A motor-cycle frame, having a diamond-shaped body, and a loop for supporting a motor, the loop extending below the lower front brace and provided with an extension secured to the steering-head, said extension being curved to conform to the rim of the front wheel, as set forth.

5. A steering-fork for a motor-cycle frame, comprising a front-fork crown, a steering-post mounted in the crown, front-fork sides, each made of two members of which the inner members are integral with the said front-fork crown, and crown-plates carrying the outer members of the fork, the lower crown-plate being rigidly secured to the crown and the upper one detachably secured to the steering-post, as set forth.

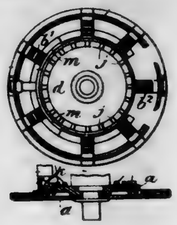
6. A steering-fork for a motor-cycle frame, comprising a steering-post, front-fork sides, each made of two members, of which the inner members are secured by a crown to the steering-post, and crown-plates, of which one is rigidly secured to the outer members and to the said crown, while the other crown-plate is removably attached to the outer members and to the steering-post, as set forth.

7. A steering-fork for a motor-cycle frame, comprising a steering-post, front-fork sides, each made of two members, of which the inner members are connected by a crown to the steering-post, crown-plates, of which one is rigidly secured to the outer members and to the said crown, and the other upper crown-plate screws on the steering-post, and bolts for securing the upper crown-plate to the upper ends of the said outer members, as set forth.

8. A motor-cycle frame and steering-fork therefor, comprising a dia-

mond-shaped body, an integral loop for supporting the motor, extending below the lower brace and forming a downward continuation of the center brace, the said loop having an extension-arm rigidly connected with the steering-head of the said body, a steering-post mounted to turn in the said steering-head, front-fork sides, each made of two members, of which the inner members are connected by a crown with the said steering-post, and crown-plates, of which one is rigidly secured to the outer members and to the said crown, and the other crown-plate is detachably secured to the upper ends of the outer members and the said steering-post, as set forth.

709,381. TWO-SPEED GEAR-WHEEL. WILLIAM D. WARBROUGH, Lincoln, England. Filed Oct. 4, 1901. Serial No. 77,604. (No model.)



Claim.—1. In an adjustable wheel, the combination, with a back plate, of radially-movable jaws carried by the said back plate, a flexible divided ring secured to one of the said jaws and slidable in certain of the remaining jaws, and means for moving the said jaws simultaneously to expand and contract the said ring, substantially as set forth.

2. In an adjustable wheel, the combination, with a back plate, of radially-movable jaws carried by the said back plate, a flexible divided ring secured to one of the said jaws and slidable in certain of the remaining jaws, a bridge-piece secured to one of the said jaws in the gap of the said ring, and means for moving the said jaws simultaneously to expand and contract the said ring and change the position of the said bridge-piece, substantially as set forth.

3. In an adjustable wheel, the combination, with a back plate provided with radial slots and two concentric stop-flanges, of jaws slidable in the said slots, a flexible divided ring secured to one of the said jaws and slidable in certain of the remaining jaws and between the said flanges, and means for sliding the said jaws simultaneously, substantially as set forth.

4. In an adjustable wheel, the combination, with a back plate, of radially-movable jaws carried by the said back plate and provided with teeth, a flexible divided ring secured to one of the said jaws and slidable in certain of the remaining jaws, and an independently-revolvable disk revoluble upon the same axis as the said back plate and provided with a spiral thread which engages with the said teeth and operates to slide the said jaws simultaneously, substantially as set forth.

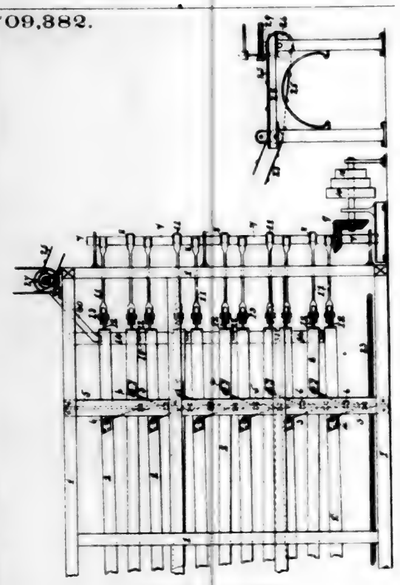
5. In an adjustable wheel, the combination, with a back plate, and a disk provided with a spiral thread and normally revolving with the said back plate; of radially-movable jaws carried by the said back plate and provided with teeth which engage with the said spiral thread, a flexible divided ring secured to one of the said jaws and slidable in certain of the remaining jaws, driving devices for revolving the said back plate continuously, and means for arresting the motion of the said disk intermittently, substantially as set forth.

709,382. SWEETMEAT-MACHINE. WILLIAM L. WHITE, Hedon, near Hull, England. Filed Feb. 24, 1902. Serial No. 95,496. (No model.)

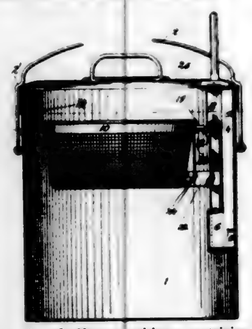
Claim.—1. In a sweetmeat-machine, the combination, with a series of superposed supports for the sweetmeats inclined in opposite directions alternately and provided with false bottoms of textile material which polish the sweetmeats, and means for shaking the said supports; of guides for turning over the sweetmeats as they drop from one support to another, so that the opposite sides of the sweetmeats are alternately dried and polished, substantially as set forth.

2. In a sweetmeat-machine, the combination, with endless traveling conveyer-belts whereon the sweetmeats are dried in the upper part of the machine, of shaking-supports for the sweetmeats arranged under the said belts and inclined in opposite directions and provided with false bottoms of textile material for polishing the sweetmeats, and guides for turning over the sweetmeats as they fall from one shaking-support to another so that the opposite sides of the sweetmeats are polished alternately, substantially as set forth.

709,382.



709,388. ASH-SIFTER. ELIJAH WILLCOX, Yonkers, N. Y. Filed Sept. 11, 1901. Serial No. 75,162. (No model.)



Claim.—1. An ash-sifter comprising a containing vessel, an oscillatory sieve mounted therein, a shoe movable with said sieve, and a lever shiftably mounted to change its fulcrum and having a slidable operative connection with said shoe.

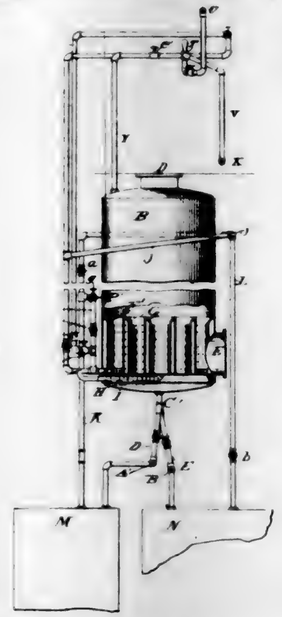
2. An ash-sifter comprising a containing vessel, a rockable sieve mounted in said vessel, a lever for actuating said sieve, said lever being provided with a longitudinal slot which operatively engages with a fixed pivot, and the lever being longitudinally movable relative to said pivot for the purpose of shifting the fulcrum of said lever, and a slidable connection between the sieve and the lever, whereby the lever may be adjusted expeditiously in an endwise direction on the sieve.

3. An ash-shifter comprising a containing vessel, an oscillatory sieve mounted therein, a supporting-plate secured within said vessel and provided with spaced stops, a lever fulcrumed on said supporting device at a point above the stops thereof, a noise-deadening block carried by said lever and adapted to strike against either of said stops, and means for connecting said lever operatively with said sieve.

4. An ash-sifter, comprising a containing vessel provided with a lever-stud and with sieve-supports, an oscillatory sieve provided with hooks for engaging said supports, and a lever for actuating said sieve and provided with a cross-shaped slot for slidably engaging said lever-stud, whereby said lever is rendered readily detachable, and the fulcrum-point thereof is easily changed at will.

5. An ash-sifter comprising a containing vessel provided with a lever-stud and with sieve-supports, an oscillatory sieve having hooks which engage with said supports, a lever provided with a cross-shaped slot and adapted to slidably engage with said lever-stud, means connecting said lever and said sieve, and a bearing-plate on said vessel and provided with stops, the lower end of the lever being arranged to play between the stops.

709,384. METHOD OF TREATING GARBAGE. STEPHEN E. WILSON, Frenchlanding, Mich. Filed Sept. 8, 1897. Serial No. 650,936. (No model.)



Claim.—1. The process of extracting liquid from a mass or charge of material, which consists in applying fluid under pressure to all parts of its surface simultaneously, and then passing the fluid under pressure through the mass.

2. The method of expressing liquids from a mass or charge of material, which consists in applying fluid under pressure to all parts of its surface simultaneously; reducing the pressure upon one side thereof, and passing the fluid under pressure through the mass.

3. The method of expressing liquids from a mass or charge of material which consists in dividing said mass into a number of comparatively small bodies; applying fluid under pressure to all surfaces of the divided bodies; and finally passing fluid under pressure from one side of the mass to the other.

4. The method of treating garbage and like material which consists in cooking the same, applying fluid under pressure simultaneously to the different faces or surfaces of the mass; and finally passing fluid under pressure from one side of the mass to the other.

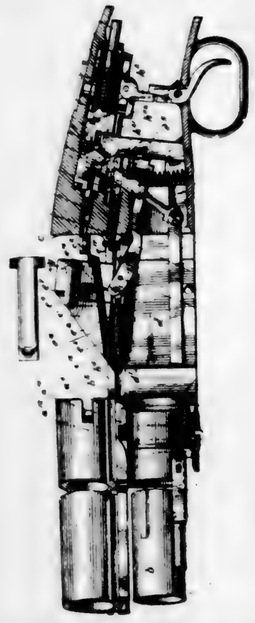
5. The method of treating garbage and the like, which consists in cooking the same; applying fluid under pressure to all surfaces of the mass simultaneously; reducing the pressure upon one side thereof; passing fluid under pressure through said mass; and conducting the escaping fluid to a separate tank for cooking a new charge of material.

6. The method of expressing liquids from a mass or charge of material which consists in dividing said mass into a number of bodies; applying fluid under pressure to all parts of its surface simultaneously; reducing the pressure upon some of the faces of the mass; and finally passing fluid under pressure therethrough from the other faces.

7. The process of treating garbage and like material, which consists in cooking the same within a closed tank; connecting said tank with a separate tank wherein an equal pressure is maintained; applying fluid-pressure simultaneously to all the surfaces of the mass under treatment and allowing the contained liquid to pass through to said pressure-tank; shutting off said high-pressure tank and opening communication with a low-pressure tank; compressing the mass; and finally passing fluid under pressure through the mass under treatment into said low-pressure tank.

8. The process of treating garbage or like material, which consists in dividing said mass into a number of comparatively small bodies; cooking the same within a closed tank; connecting said tank with a separate tank wherein an equal pressure is maintained; applying fluid under pressure simultaneously to all the surfaces of the mass under treatment and allowing the contained liquid therein to pass through to said pressure-tank; shutting off said high-pressure tank and opening communication with a low-pressure tank; compressing the mass upon that side opposite the connection with the low-pressure tank; and finally passing fluid under pressure through the mass under treatment into said low-pressure tank.

709,385. MAGAZINE-FIREARM. CHARLES A. YOUPE, Enon, Ohio. Filed Mar. 7, 1902. Serial No. 97,190. (No model.)



Claim.—1. In a firearm, the combination of a breech-block frame, a sliding barrel thereon and a sliding grip, a slotted tongue on the under side of the barrel and a metallic piece seated in the sliding grip having an elongated recess to receive the slotted tongue, and a pin engaging the metallic piece and passing through the slot of the tongue to connect the grip and barrel, said slot being of such length that the thrust of the grip on the barrel shall be borne by the contact of the ends of the tongue and recess in the metallic piece and not by the connecting-pin.

2. The combination of the breech-block frame, a sliding barrel thereon, a magazine under the barrel, a chamber in the breech-block frame under the breech of the barrel in the rear of the magazine to receive the carrier, the carrier, a spring-actuated finger in said carrier to project inward over the upper end of the carrier when the barrel is opened and means actuated by the end of the barrel to turn said finger out of said position when the barrel is closed, substantially as described.

3. The combination of a breech-block frame, a sliding barrel thereon, a chamber in the breech-block frame under the breech of the barrel to receive a cartridge or shell carrier, the carrier, a movable finger in said carrier, means to hold said finger to project inward over the upper end of said carrier when the barrel is opened and means actuated by the barrel to turn said finger out of said position when the barrel is closed.

4. The combination of the breech-block frame, a sliding barrel thereon, a magazine under the barrel, a chamber in the breech-block frame under the breech of the barrel and in rear of the magazine to receive the carrier, the carrier and a spring-actuated movable bottom in the carrier.

5. The combination of the breech-block frame, a sliding barrel thereon, a magazine under the barrel, a chamber in the breech-block frame under the barrel, and in rear of the magazine to receive the carrier, the carrier, and a spring-actuated movable bottom in said carrier hinged at its

forward end to the forward end of the carrier and adapted to engage the rim of the shell to hold said shell in the carrier.

6. The combination of the breech-block frame, a sliding barrel thereon, a magazine under the barrel, a chamber in the breech-block frame under the breech of the barrel and in rear of the magazine, the carrier, a cocking-rod actuated when the barrel is opened and closed, a projection on said cocking-rod adapted to engage said carrier to hold the same when in the chamber and to release the same when the barrel has been opened a predetermined distance, substantially as described.

7. In a firearm the combination of a breech-block frame having a breech-block, a barrel sliding on the breech-block frame toward and from the breech-block, and shell-extractors in the sides of the breech-block and in line with the barrel consisting of small blocks having rim-engaging rear ends and pivoted at their forward ends and springs for holding the rim-engaging ends inward toward each other, substantially as described.

8. The combination of the breech-block frame, a sliding barrel thereon, a spring-actuated latch to limit the forward movement of the same, a magazine under the barrel having a catch, and a finger-piece on the breech-block frame engaging both the barrel-latch and magazine-catch and adapted to be operated to simultaneously release the barrel and magazine from the breech-block frame.

9. In a firearm the combination of the breech-block frame and breech-block, a barrel sliding on the breech-block frame, a shell or cartridge carrier, spring-actuated extractors in the sides of the breech-block, to catch and hold the sides of the rim of the shell when the latter is pushed rearwardly on the carrier by the barrel, and a spring-protruded seat in the breech-block constructed to support the shell at the lower edge of its rim, substantially as described.

10. In combination with a breech-block frame, a sliding barrel thereon, a spring-actuated firing-pin, a sear to engage and hold the same when cocked, a cocking-lever adapted to cock said firing-pin when the barrel is moved forward, a spring-actuated safety-catch to prevent the operation of the sear when the barrel is moved forward and arranged to be operated by the cocking-lever upon the closing of the barrel to release the sear.

11. In combination with the breech-block frame, a sliding barrel thereon, a spring-actuated firing-pin, a sear to engage and hold the same when cocked, a cocking-lever adapted to cock said firing-pin when the barrel is moved forward, a spring-actuated safety-catch to prevent the operation of the sear when the barrel is moved forward and arranged to be operated by the cocking-lever to release the sear when the barrel is being closed, and a manually-operated safety-catch to engage and lock the sear when the barrel is closed.

12. The combination of a breech-block frame, a sliding barrel thereon, a chamber in the breech-block frame under the breech of the barrel to receive a cartridge or shell carrier, the carrier, a finger turning on a vertical pivot in the side of the carrier to be turned laterally across the top of the same and means for yieldingly holding said finger across the top of the carrier.

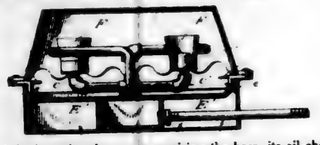
709,386. **SECURING DEVICE FOR BOXES, &c.** WILLIS G. YOUNG, Dayton, Ohio. Filed Apr. 12, 1902. Serial No. 102,680. (No model.)

Claim.—In a receptacle of the character described, a keeper having centrally-disposed slit, having at its end branches obliquely disposed in opposite directions from opposite sides and ends to form anchoring-teeth and longitudinally-disposed lip-sections engaged with the material of the receptacle, and a tongue having slits and securing-lips engaged with the material of the receptacle, the free end of the tongue being adapted to be passed through the central slit of the keeper and bent over the latter and held out of contact with the flap of the receptacle, substantially as described.

709,387. **HYDROCARBON-BURNER.** ERNEST BETZ, Washington, D. C., assignor to Columbian Hydro-Carbon Burner Company, Washington, D. C. Filed July 3, 1901. Serial No. 67,006. (No model.)

Claim.—1. In a hydrocarbon-burner, the combination with the base, its oil-receptacle and hot-air chamber below its top, the inclosing deflector-cap supported from said base, and having a depending flange extending downward nearly to said top, the mixing-tube and coil-pipe within said cap, the burner extension of said coil-pipe under said mixing-tube and above the top of said base-plate, and the oil-feed pipe extending within the hot-air chamber to said oil-receptacle, substantially as specified.

2. In a hydrocarbon-burner, the oil-receptacle and the adjacent hot-air chamber forming a base, the pipe from said receptacle, and its burner-tip, on said base, the mixing-tube above said base, said chamber having air inlet and exit openings in its bottom and top walls respectively, the deflector-plate above said exit-opening, and the oil-feed pipe passing through said hot-air chamber, substantially as specified.

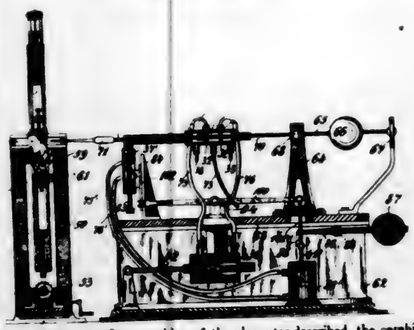


3. A hydrocarbon-burner, comprising the base, its oil-chamber and adjacent hot-air chamber, the mixing-tube supported therefrom, the coil-pipe from said oil-chamber extending to said mixing-tube, and provided with a burner-tip, and the deflector-cap supported upon said base-plate, and having a top and a depending flange inclosing said tube and coil, said flange being of such height as to leave only a narrow opening therebetween and the base-plate, whereby the flame takes an upward rise from the burner-tip, is deflected within the cap, and falls the full depth of the flange in intimate contact with said tube and coil, and with the base-plate, and emerging under the cap again, rises exteriorly around the same, substantially as specified.

4. A hydrocarbon-burner, comprising the base of box form divided by a partition to form an oil-receptacle and a hot-air chamber, the mixing-tube supported from said base, the cap supported upon said base, and having a top, and a depending flange inclosing said tube and coil, and the oil-feed coil-pipe extending from the oil-chamber upward between the base and cap, and downward under the mixing-tube, substantially as specified.

5. A hydrocarbon-burner, comprising the base of box form divided by a partition to form an oil-receptacle and a hot-air chamber, the mixing-tube supported from said base, the oil-feed coil-pipe provided with a burner-tip, the cap supported upon said base, and having a depending flange inclosing said coil and tube, said flange being of such vertical extent as to leave only a narrow opening between its margin and the base, and said hot-air chamber having air inlet and exit openings in its bottom and top walls respectively, substantially as specified.

709,388. **SCULPTURING-MACHINE.** AUGUSTO BONTEMPI, Naples, Italy, assignor to Mary Belle Scott-Uda, Naples, Italy. Filed May 23, 1901. Serial No. 61,598. (No model.)



Claim.—1. In a machine of the character described, the combination with a frame, of a tracer carried by said frame, of cutting-tools also carried by said frame, means operating said tools, a plurality of means moving said tools in a plurality of directions, and means controlled by said tracer and determining in advance the extent of movement of said tools.

2. In a machine of the character described, the combination with a frame, of a tracer carried by said frame, of cutting-tools also carried by said frame, of a plurality of hydraulic-pressure means moving said tools in a plurality of directions, means controlled by said tracer and determining the extent of such movement, means carrying the material to be operated upon, means for adjusting said material to the operating position of said tools, and means operating said tools.

3. In a machine of the character described, the combination with a frame, of a tracer mounted upon said frame, of cutting-tools also mounted upon said frame, means for operating said tools, a plurality of suitable hydraulic-pressure means moving said tools in a plurality of directions, and means controlled by the movement of the tracer and determining in advance the extent of movement of the cutting-tools, while in operating position.

4. In a machine of the character described, the combination with a frame, of a tracer mounted thereon, of cutting-tools also mounted on said frame, means operating said tools, suitable pressure means effecting the movement of the tools in any desired direction, said pressure means comprising a working cylinder producing a vertical movement of the tools, a like cylinder producing a lateral movement of the tools, a third similar cylinder producing a longitudinal movement of the tools; of valve-cylinders, suitable connection between said valve-cylinders and said working cylinders, the valve-cylinders directing the flow of pressure into any one of said working cylinders; and suitable connection between the tracer and the valves in the valve-cylinders.

5. In a machine of the character described, the combination with a frame, of a tracer mounted thereon of cutting-tools also mounted on said frame, means operating said tools, suitable pressure means mounted on said frame and effecting the movement of the tools in any desired direction, said pressure means comprising a working cylinder producing a vertical movement of the tools, a like cylinder producing a lateral movement of the tools, a third similar cylinder producing a longitudinal movement of the tools; of a series of valve-cylinders, each of which is suitably connected with one of said working cylinders, of double piston-valves mounted on valve-rods and sliding within said valve-cylinders, said valves directing the pressure to said working cylinders and suitable connections between said tracer and the valve-rods to operate the valves.

6. In a machine of the character described, the combination with a frame, of a tracer mounted thereon, of cutting-tools also mounted on said frame, means operating said tools, of working cylinders suitably connected to said cutting-tools, one of said cylinders producing a lateral displacement of the tools, one of said cylinders producing a vertical displacement of the tools, and a third working cylinder producing a longitudinal displacement of the tools; of a valve-cylinder for each of said working cylinders, with suitable connection between the same, of a double piston-valve for each of said valve-cylinders, said valves being operated by the movement of said tracer to direct pressure into any one or more of said working cylinders.

7. In a machine of the character described, the combination with a frame, a tracer mounted thereon, of cutting-tools also mounted on said frame, a plurality of hydraulic-pressure means, each effecting the movement of said tools in a different direction, means actuated by the tracer for distributing said hydraulic pressure and determining in advance the extent of any movement of the tools, and means for operating said tools.

8. In a machine of the character described, the combination with a frame, a tracer mounted thereon, of cutting-tools also mounted thereon, means operating said tools, a plurality of hydraulic-pressure means moving said tools in a plurality of directions, means controlled by the tracer determining the extent of movement of the tools, and comprising means for putting into operation said pressure, and means for automatically cutting off said pressure when the tools have reached the end of their determined movement.

9. In a machine of the character described, the combination with a frame, of a table carried by said frame, of a support carried by said table, a tracer connected by a universal joint to said support, of cutting-tools also suitably supported on said table and capable of movement in a plurality of directions, means operating said tools, a plurality of hydraulic-pressure means moving said tools in a plurality of directions, and means operated by said tracer determining the extent of movement of said tools.

10. In a machine of the character described, the combination with a frame, of a table carried by said frame, of a tracer suitably mounted on said table to permit a movement of the same in any direction, of supports revolubly mounted on said table, of cutting-tools connected to said supports by universal joints, means for operating said tools, a plurality of hydraulic-pressure means moving said tools, in any direction while in operating position, and suitable connections between the tracer and said moving means to control the latter by the movement of the tracer, the movement of said tracer in any desired direction producing a movement of the tools in keeping therewith.

11. In a machine of the character described, the combination with a frame, of a table carried by said frame, of a tracer suitably mounted upon said table and movable thereon in any direction, of a series of shafts suitably mounted upon said table and cutting-tools carried thereby, of blocks suitably supported upon said table and concentric to said shafts, of pulleys loosely mounted upon said blocks, means for driving said pulleys, of pins carried by said pulleys, said pins engaging suitable slots in said shafts to rotate the latter, means for moving the said shafts in a plurality of directions and suitable connections between said moving means and said tracer to produce upon the movement of the tracer in any desired direction a subsequent corresponding movement of said shafts.

12. In a machine of the character described, the combination with a frame, of a slidable table carried thereby, of a tracer mounted on said table, of cutting-tools also mounted thereon, suitable pressure means for moving said tools in any desired direction, said means comprising working cylinders, one of said cylinders being secured to the under side of said table, a piston-rod being fixed to said frame and a piston within said cylinder, and carried by said rod, said cylinder moving said table to longitudinally displace said tools; the other cylinders being secured to said frame, a piston movable within each of said last-named cylinders, and suitable connection between said movable pistons and said tools, one of said movable pistons causing the lateral displacement of said tools; and the other causing the vertical displacement of said tools; of suitable connections between said tracer and said cylinders to control the pressure in said cylinders and means for operating said tools.

13. In a machine of the character described, the combination with a frame, of a sliding table carried thereby, of a tracer universally mounted on said table, of cutting-tools also universally mounted on said table, of valve-cylinders suitably mounted on said machine, of working cylinders, pistons working in said working cylinders, one of said working cylinders being mounted on said table, its piston being rigidly secured to said frame, the other working cylinders being mounted upon said frame, their pistons being suitably connected to said tools, means operating said tools, comprising shafts carrying said tools, blocks suitably mounted on said table and provided with central openings, said shafts extending through said openings, pulleys loosely mounted upon said blocks, slots in said shafts and pins projecting from said pulleys and engaging said slots; suitable valve-cylinders and suitable connections between said cylinders and the working cylinders; and double piston-valves within the valve-cylinders and mounted on valve-rods the outer ends of which are connected to said tracer.

709,389. **FAUCET.** RALPH W. BOOTH, New Brunswick, N. J. Filed Dec. 14, 1899. Renewed Mar. 13, 1902. Serial No. 98,089. (No model.)

Claim.—1. A faucet comprising a base-plate, an annular spout-flange rising therefrom with its upper edge turned over and apertured, an internal threaded drop-flange and a screw-cap designed to be screwed into the drop-flange with a portion extended over the aperture of the spout-flange.

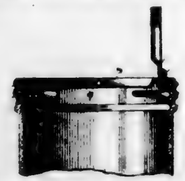
2. A faucet having a central opening, an annular chamber thereabove provided with a vent, a spout communicating with the chamber, and a cap having a hollow flange to fit over the edge of the spout-wall to control said vent arranged to simultaneously control the vent and the flow of liquid to the chamber.

3. A faucet comprising an apertured base-plate, an annular spout-flange having its upper edge turned over and apertured and terminating in a drop-flange of less width than the height of the spout-flange, and a cap designed to fit into the drop-flange and provided with a flange extending over the aperture in the turned edge of the spout-wall.

4. A faucet comprising an apertured base-plate having an upturned annular flange surrounded by a depression, a spout-wall rising from the outer edge of the depression and having its upper edge turned over and terminating in a drop-flange, a spout secured to the spout-wall, a gasket in the depression, and a cap provided with a hollow flang designed to fit over the turned edge of the spout-wall to control a vent therein

---

709,390. **JAR-COVER.** RALPH W. BOOTH, New Brunswick, N. J. Filed Dec. 14, 1899. Renewed Mar. 13, 1902. Serial No. 98,090. (No model.)



Claim.—1. The can-top described, consisting of a cover with spirally-grooved drop-flange, and central aperture with its surrounding wall inclined, and a lid hinged to the horizontal portion of said cover and having a central depression the surrounding wall of which is inclined in less degree than the inclined wall of the aperture in the cover to fit snugly within the same, as set forth.

2. The can-top described, consisting of the cover with depending annular flange spirally grooved, and a horizontal portion having central depressed aperture the surrounding wall of which is inclined, and a lid hinged to the horizontal portion of the cover with an annular horizontal portion bearing thereon and formed with a central depression with annular inclined wall of less degree than that of the said aperture to be sprung into and snugly fit the same, the latter being expanded and a snug fit assured, substantially as shown and described.

709,891. BOTTLE STOPPER AND SPRINKLER. HARRY O. BRAWNER, Baltimore, Md. Filed Aug. 1, 1901. Serial No. 70,580. (No model.)

Claim.—1. The herein-described improvement in bottle stoppers and sprinklers, consisting of a stopper adapted to be fitted to a bottle-mouth and having a laterally-projecting flange in contact with the upper surface of the said bottle-mouth, and a tapered passage extending through the bottle-stopper and terminating in a fine opening at the inner end of the stopper and gradually increasing in diameter from the opening at the inner end of the stopper toward its outer end, and a supplementary stopper having a lateral flange closing the enlarged end of the tapered passage, substantially as described.

2. The herein-described improvement in bottle stoppers and sprinklers, consisting of a main-stopper structure adapted to close the bottle-mouth, and having a lateral flange adapted to be seated on the outer surface of the bottle-mouth, and an inwardly-projecting nipple having a smooth outer surface, a washer surrounding said nipple, said main stopper having a passage therethrough gradually increasing from a fine opening at the inner end to an enlarged opening at the outer end of the stopper, a supplementary stopper adapted to be seated in the outer end of said passage having a laterally-projecting flange in contact with the outer end of said main stopper, and an inwardly-projecting nipple having a smooth outer surface with a washer surrounding said nipple, substantially as described.

709,892. SUTURE-CLAMP. HAYES BROWN, Surbiton Hill, England. Filed May 6, 1902. Serial No. 106,318. (No model.)

Claim.—1. A clamp for surgical purposes, comprising semicircular prongs lying in parallel planes and curved in the same direction and a bridge-piece connecting them, substantially as described.

2. A clamp for surgical purposes, comprising semicircular prongs lying in parallel planes and curved in the same direction, a bridge-piece at right angles to the prongs and connecting them substantially at the circumference of the semicircle, said bridge-piece and prongs formed of the same strip and bent into position, substantially as described.

709,893. LAMP-CHIMNEY PROTECTOR. WILLIAM C BURRUSS, Norfolk, Va. Filed June 5, 1901. Serial No. 63,207. (No model.)

Claim.—1. A lamp-chimney protector provided with a hollow conical perforate projection adapted to lie in the path of the rising heat-currents, and a supporting-rim carried by said projection for maintaining the protector in applied position, said rim being provided with a series of concentric grooves to adapt the protector for application to chimneys of varying sizes.

2. A lamp-chimney protector provided with a hollow conical perforate projection adapted to lie in the path of the rising heat-currents, said projection being corrugated to form a series of converging grooves on its exterior surface, and a supporting-rim carried by said projection for maintaining the protector in applied position, said rim being provided with means to adapt the protector for application to chimneys of various sizes.

3. A lamp-chimney protector provided with a hollow conical perforate projection adapted to lie in the path of the rising heat-currents, said projection being corrugated to form a series of converging grooves on its exterior surface, and a supporting-rim carried by said projection for maintaining the protector in applied position, said rim being provided with a series of concentric grooves to adapt the protector for application to chimneys of various sizes.

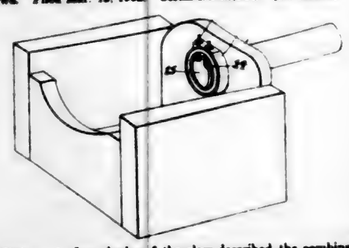
4. A lamp-chimney protector comprising a hollow perforated exteriorly-corrugated inverted conical body having a support and adapted to be arranged in position within the upper end of the chimney.

709,894. CAR-RECORD DEVICE. JOSEPH R. CAVANAGH, JOHN B. HARBAR, and JOSEPH D. CLARKE, Indianapolis, Ind. Filed June 5, 1901. Serial No. 63,310. (No model.)

Claim.—1. In a record device of the class described, a record-block consisting of a body having a recess or pocket provided with terminal transverse shoulders, holding-studs and guard-flanges carried by the block, said studs having interlocking engagement with the cards or slips.

2. In a record device of the class described, a record-block consisting of a body having a recess or pocket provided with terminal transverse shoulders, holding-studs arranged slightly in advance of said terminal shoulders, guard-flanges overhanging the end portions of the recess or pocket, and the record cards or slips having notched ends.

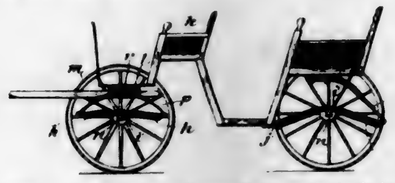
709,895. DRAIN-TILE PROTECTOR. JOHN W. COOK, Sr., Nevada, Iowa. Filed Mar. 15, 1902. Serial No. 98,344. (No model.)



Claim.—1. In a device of the class described, the combination of a tile having one or more holes in the periphery thereof and near one end a collar fitting over the end of said tile and one or more holes in the periphery thereof, a cover to fit inside of said tile and on the inside of the collar, means for pivotally attaching the cover to the tile and the collar, and the box having a back through which the tile extends, substantially as and for the purposes stated.

2. In a device of the class described, the combination of a tile having two holes in the periphery thereof and near one end, a collar having holes corresponding with the holes in the tile to fit over the end of the tile, bolts extending through the holes in the collar and holes in the tile, loops on the ends of said bolts which are inside of the tile, a cover having a loop in the upper portion thereof, a bar designed to pass through the loop in the bolts and the loop in the cover, a box having two side portions, a back and front portion, said back portion having an opening in the upper portion thereof designed to receive the tile, the front portion being of less height in the sides and back and being curved downwardly to allow the water to flow from the interior of the box before it reaches the level even with the lower edges of the tile, substantially as and for the purposes stated.

709,896. SPRING SUSPENSION FOR VEHICLE-BODIES. FERDINAND CORNEEN, Ritzergut Saarmund, near Potsdam, Germany, assignor of one-half to Edward F. Wilhelm, Haymarket, Va. Filed Mar. 12, 1902. Serial No. 97,928. (No model.)



Claim.—1. In a wheeled vehicle, a spring suspension for the body portion thereof, consisting of spiral tension-springs connected at one end to the axle, the opposite ends of said springs being connected to the body portion, said spring suspension serving also as the draft connection to the axle; substantially as described.

2. In a wheeled vehicle, a spring suspension for the body portion thereof, consisting of spiral tension-springs, connected at one end to the axle and extending thence inwardly, the opposite ends being connected to the body portion, said spring suspension serving also as the draft connection to the axle; substantially as described.

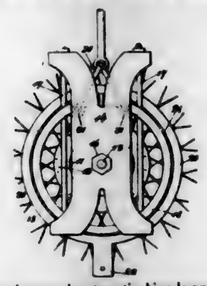
3. In a wheeled vehicle, a spring suspension for the body portion thereof, consisting of spiral tension-springs connected at one end to the axle and extending thence inwardly and downwardly, the opposite ends being connected to the body portion, said spring suspension serving also as the draft connection to the axle; substantially as described.

4. In a wheeled vehicle, a spring suspension for the body portion thereof, consisting of spiral tension-springs connected at one end to the axle and extending thence inwardly and downwardly, the opposite ends being connected to the body portion through the intermediary of auxiliary leaf-springs, said spring suspension serving also as the draft connection to the axle; substantially as described.

5. In a wheeled vehicle, a spring suspension for the body portion thereof, consisting of spiral tension-springs, plates on the axle with which one end of the springs engages, said springs extending diagonally downward and inward and being connected at their opposite ends to the body portion, said spring suspension serving also as the draft connection to the axle; substantially as described.

6. In a wheeled vehicle, a spring suspension for the body portion thereof, consisting of a pair of spiral tension-springs at each axle end, the members of each pair extending oppositely in diagonal, downward and inward directions to connections with the body portion, said spring suspension serving also as the draft connection to the axle; substantially as described.

709,897. AUTOMATIC BICYCLE-PUMP. THEODORE A. DIEBOLD Stuart, Iowa. Filed Oct. 31, 1901. Serial No. 80,616 (No model.)



Claim.—1. An improved automatic bicycle-pump comprising, in combination, a bicycle-wheel, a stationary axle passed through the wheel-hub, and a pneumatic tire on the wheel, a frame secured to the wheel-axle, a ring vertically movable relative to said frame, a frame rotatable on said ring, a rod projecting from said frame inwardly toward the center of the bicycle-hub, a pump fixed to the hub, a piston in the pump connected with the said rod, and a tube leading from the pump to the tire of the wheel, and means for moving the ring and its frame to a position concentric relative to the axle or to a position eccentric relative thereto, for the purposes stated.

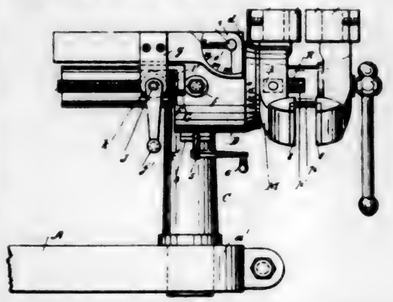
2. An automatic bicycle-pump, comprising in combination, a bicycle-wheel, a pneumatic tire thereon, a stationary axle passed through the wheel-hub, a frame fixed to the axle at one end of the hub, a split ring vertically movable relative to the frame, a circular frame mounted on the split ring and capable of rotation relative thereto, a pump fixed to the central portion of the hub, a rod connecting the circular ring with the pump-piston, a tube leading from the pump to the pneumatic tire, a lever connected with the machine-frame, an arm pivoted to the lever and two links pivoted to the said arm and to the end portions of the split ring, substantially as and for the purposes stated.

3. An improved bicycle-pump, comprising in combination, a bicycle-wheel, a pneumatic tire thereon, a stationary axle passed through the wheel-hub, a frame 14 fixed to the stationary axle, parallel rods 17 fixed to the frame 14 and extended vertically, a split ring vertically movable on said rods, a circular frame having an arm 20 mounted on the split ring, a pump fixed to the central portion of the wheel-hub, a piston in said pump, a rod connecting the arm 20 with the piston, a tube leading from the pump to the tire, a lever fulcrumed to the machine-frame, an arm pivoted to one end of the lever, two links pivoted to the arm and to the end portions of the split ring, substantially as and for the purposes stated.

709,898. ASBESTOS STEREOTYPE. LEOPOLD ELIAS Breslau, Germany. Filed May 14, 1901. Serial No. 60,294. (No specimens.)

Claim.—A stereotype-matrix composed of asbestos covered with a thin coating of plant-glue, substantially as described.

709,899. VISE. JOSEPH F. BEHERT, Waynesboro, Pa., assignor to Hummert Manufacturing Company, Waynesboro, Pa. Filed Jan. 7, 1902. Serial No. 88,710. (No model.)



Claim.—1. In a vise, the combination, with a supporting-base, of a flat vise-table pivoted to the base and movable in a horizontal plane, a bearing hinged to one edge of the said vise-table, and vise-jaws carried by the said bearing, substantially as set forth.

2. In a vise, the combination, with a supporting arm or base provided with a socket, of a flat vise-table provided with a downwardly-projecting pivot pillar or post which engages with the said socket, a bearing hinged to one edge of the said vise-table, and vise-jaws carried by the said bearing, substantially as set forth.

3. In a vise, the combination, with a supporting-base, and a flat vise-table arranged above it; of a vertical pillar or post interposed between the said base and vise-table and pivotally connecting them, a bearing hinged to one edge of the said vise-table, and vise-jaws carried by the said bearing, substantially as set forth.

4. In a vise, the combination, with a supporting-base, and a pillar projecting from it; of a flat vise-table provided with a contractible bearing which is pivoted on the said pillar, a bearing hinged to one edge of the said vise-table, and vise-jaws carried by the said bearing, substantially as set forth.

5. In a vise, the combination, with a flat vise-table, of a bearing arranged under and hinged to one edge of the said table, and vise-jaws carried by the said bearing, substantially as set forth.

6. In a vise, the combination, with a flat vise-table provided with a graduated scale, of a bearing arranged under and hinged to one edge of the said table, a hinge-pin secured to the said bearing and movable in the said table, a pointer secured to the said pin adjacent to the said scale, and vise-jaws carried by the said bearing, substantially as set forth.

7. In a vise, the combination, with a vise-table, a bearing pivoted to the table and movable in a vertical plane, and vise-jaws carried by the

said bearing; of a screw pivoted to the said bearing, a revolvable nut supported from the said table and engaging with the said screw, and means for revolving the said nut, substantially as set forth.

8. In a vise, the combination, with a vise-table, a bearing pivoted to the table, and vise-jaws carried by the said bearing; of a screw pivoted to the said bearing, a revolvable nut for engaging said screw supported from the said table and carrying a beveled toothed wheel, a beveled toothed wheel also supported from the said table and gearing into the said wheel, and means for revolving the said wheels, substantially as set forth.

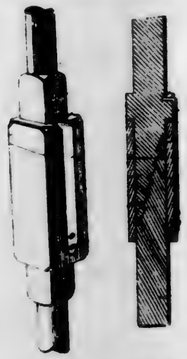
9. In a vise, the combination, with a vise-table having two brackets, a bearing pivoted to the said table, and vise-jaws carried by the said bearing; of a screw pivoted to the bearing, a frame pivoted between the said brackets and provided with two slots, a nut for engaging the said screw arranged in one of the said slots and carrying a beveled toothed wheel, an operating-shaft which forms one of the pivots for the said frame, and a beveled toothed wheel arranged in the other said slot in gear with the said aforesaid wheel and secured upon the said operating-shaft, substantially as set forth.

10. In a vise, the combination, with a supporting-bearing, of an inner vise-jaw provided with a sleeve having worm-wheel teeth on it and journaled in the said bearing, means for preventing the sleeve from sliding longitudinally, a revolvable worm supported from the said bearing in gear with the worm-wheel teeth, and an outer vise-jaw which is slidable longitudinally of the said sleeve, substantially as set forth.

11. In a vise, the combination, with a supporting-bearing having a worm-chamber on one side, of a revolvable worm provided with an operating-shaft which is journaled in the ends of the said chamber, a cap which closes the worm-chamber and holds the worm-shaft in place, an inner vise-jaw provided with a sleeve which is journaled in the said bearing and provided with worm-wheel teeth which engage with the said worm, and an outer vise-jaw which is slidable longitudinally of the said sleeve, substantially as set forth.

12. In a vise, the combination, with an inner vise-jaw, and a slidable outer vise-jaw, said jaws being provided with projections arranged opposite to and parallel with each other, of removable blocks having a plurality of gripping-faces on their side portions and mounted on the said projections so that they may be turned around to grip the work between their various faces, substantially as set forth.

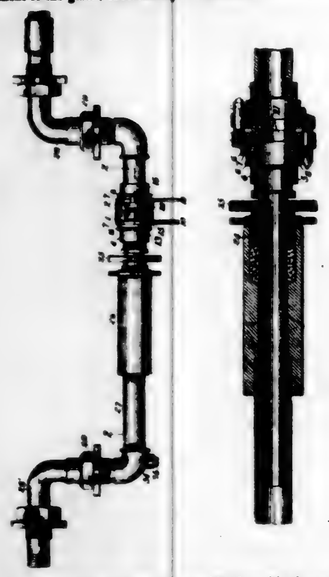
709,400. ROD-COUPLING. JAMES A. FITZPATRICK, Bakersfield, Cal. Filed Mar. 20, 1902. Serial No. 99,320. (No model.)



Claim.—In a rod-coupling of the class described, the combination with the rod-sections having matched interlocking toothed ends, one of said sections being further provided with an annular abutment-collar having a keeper-notch, and the other rod-section being further provided with a retaining-notch, a coupling-sleeve slidable upon the rod-sections and arranged to cover the joint, and a fastening-latch having a permanent connection with the coupling-sleeve and provided beyond one end of the latter with an engaging hook adapted to respectively engage in the separate notches.

709,401. TRAIN-PIPE COUPLING. THOMAS H. HENDERSON, Portsmouth, Va., assignor of two-thirds to Charles Paddock Storrs, Wilmington, Del., and Robert Randolph Hicks, Norfolk, Va. Filed June 5, 1902. Serial No. 110,262. (No model.)

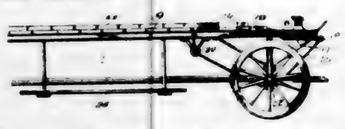
Claim.—1. In train-pipe couplings, a pair of pipe-sections adapted to slide one within the other, the inner section being provided with a vent-hole intermediate its ends, a stuffing-box mounted on the outer section, a gland at one end of said stuffing-box, packing within the box adapted to be compressed by the gland, and a hand-wheel or lock-nut for fixing the adjustment of the gland, substantially as described.



2. In train-pipe couplings, the combination with pipe-sections provided with couplings and a slip joint, of angular pipe-sections having an elbow connection therewith and provided with terminal extensions substantially at right angles thereto and substantially parallel with the main pipe-sections, the angular and terminal sections being each provided with a rotary box consisting of a coupling-nut, a lock-nut, flexible packing-rings inclosed by the nut, and a metal ring interposed between the flexible rings, substantially as described.

3. In train-pipe couplings, a pair of pipe-sections each consisting of substantially horizontal terminal portions, and a transverse connecting portion, rotary boxes for permitting relative rotating movement of the transverse and end portions of the sections, couplings for uniting the adjacent ends of the pipe-sections, and a slip-joint arranged adjacent to the couplings, said joint comprising a stuffing-box, adapted to receive the slidable end portion of the other section, which slidable end portion is provided with a lateral vent-hole, substantially as and for the purpose set forth.

709,402. EXTENSION-LADDER AND TRUCK THEREFOR. EDWARD A. HERNDON, LaGrange, Ga. Filed Apr. 26, 1902. Serial No. 104,866. (No model.)



Claim.—1. In an apparatus of the class described, the combination with a suitable truck, of a ladder mounted thereon, and lifting means secured to the ladder and extending through an orifice in the said truck, said ladder, when lifted, being rotatable upon the said lifting means.

2. In an apparatus of the class described, the combination with a suitable support of a ladder mounted thereon, a bracket extending from said ladder through said truck and finding a bearing thereon, and means for swinging said bracket upon its bearing for lifting said ladder, the ladder being left free to rotate upon said bracket.

3. In a truck-ladder, the combination with a suitable truck, of an extension-ladder mounted thereon, a bracket or lifting-lever fixed to said ladder and extending therefrom substantially in line therewith, having an offset portion therein, whereby the ladder may lie flat upon the truck, while the bracket extends through the truck and lies in a parallel plane thereto, and means for pulling the free end of said bracket downwardly for lifting the ladder.

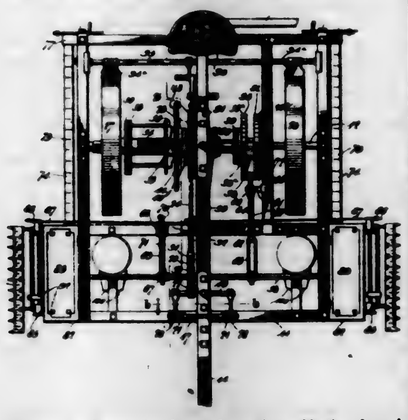
4. In a device of the class described, the combination with a suitable truck, of a ladder mounted thereon and means for lifting and pivotally supporting said ladder, such means comprising a hanger formed with converging arms and a depending portion extending therefrom, an eye formed at the end of the depending portion, a windlass mounted on the truck-body, and a cable having one end secured to the eye of the depending portion of the hanger and the other passed about said windlass.

5. A truck-ladder comprising a carrying truck or vehicle, an extension-ladder mounted thereon, a lifting, pivotally-supporting bracket for the ladder formed with a ladder-engaging bifurcated portion, and an elongated pivoting-lever portion, the said lever portion affording means for lifting and pivotally holding the ladder in its various positions, said ladder being rotatable upon said lever portion.

6. In a device of the class described the combination of a suitable truck, an extensible ladder mounted thereon, and means for elevating the said ladder and retaining it against lateral movement, such means comprising a hanger secured to the end of said ladder, a portion of said hanger extending through an orifice formed in the truck-body, a windlass on the truck-body, a cable secured to said hanger and adapted to be wound by said windlass, and a bracket fastened to the front of the truck-body and having arms extending on both sides of the said ladder-hanger.

7. A ladder-truck, comprising a truck or supporting-wagon, a ladder carried thereby, a lifting bracket or lever secured to the lower end of the ladder, one end of the same projecting through an engaging slot formed in the floor of the truck, an elongated guide-bracket arranged beneath the floor of the truck and bracing the forward bolster thereof, the said bracket guiding and bracing the ladder-lifting bracket in its various positions, substantially as described.

709,403. CHECK-ROW CORN-PLANTER. JOHN HILLERY, Colchester, Ill., assignor of one-third to John Robert Benson, Colchester, Ill. Filed Oct. 1, 1901. Serial No. 77,236. (No model.)



Claim.—1. In a check-row corn-planter, the combination of a seed-dropping mechanism, an axle-shaft, a master-wheel loose thereon, having tappets to operate said seed-dropping mechanism, and said master-wheel having reversely-disposed peripheral measuring-scales, a fixed pointer cooperating with said measuring-scales, and means to lock said master-wheel to the axle-shaft, substantially as described.

2. In a check-row corn-planter, a pointer-bar abreast of the seed-dropping mechanism and having a measuring-scale reaming forward from the seed-spout, substantially as described.

3. In a check-row corn-planter, a fixed pointer, an adjustable master-wheel having a measuring-scale coacting with said fixed pointer, seed-dropping mechanism, operated by said master-wheel, and a pointer-bar abreast of the seed-dropping mechanism having a measuring-scale running forward from the seed-spout, substantially as described.

4. In a check-row corn-planter, in combination with a seed-dropping mechanism, a shaft, a master-wheel loose thereon, to actuate the seed-dropping mechanism, a clutch to lock the master-wheel, a power-wheel, loose on said shaft, a clutch to lock said power-wheel and a hand-wheel, revolvable on said shaft, said hand-wheel and said clutches having coacting cams, whereby said clutches may be operated by said hand-wheel, substantially as described.

5. In a check-row corn-planter, a pivoted pointer-bar disposed abreast of the seed-dropping mechanism and having a measuring-scale reaming forwardly from the heel of the runner, said pointer-bar being adapted to be raised and lowered, means to raise said pointer-bar, and a spring compressed when said pointer-bar is raised, for the purpose set forth, substantially as described.

6. In a check-row corn-planter having an adjustable seed-dropper-actuating element and a scale by which to set the same, a longitudinally-movable hill finder-bar disposed to extend forwardly from the heel of the runner, and a pointer-bar having a measuring-scale, substantially as described.

7. In a planter, the combination of an axle, a main frame, a tongue pivotally connected to the axle, an element to raise and lower the front end of the frame, said element being carried by the tongue, a lever, and connections, including a spring, between said tongue and said raising and lowering element, substantially as described.

8. In a planter, a furrowing-runner having laterally-projecting wings, adapted to bear on the surface of the soil and forming rearwardly-descending inclined planes, substantially as described.

9. In a check-row corn-planter, in combination with a seed-dropping mechanism, an axle-shaft, a master-wheel loose thereon, to actuate the seed-dropping mechanism, supporting and traction wheels, one fast and the other loose on said shaft, a clutch to lock the master-wheel to the shaft, a spring to normally unclutch the same, a spring-pressed, normally effective clutch to lock said loose traction-wheel to the shaft, and a hand-wheel, free to revolve on said shaft, and between said clutches, said hand-wheel having stops on opposite sides and said clutches having cams coacting with said stops, substantially as described.

10. In a check-row corn-planter, in combination with a seed-dropping mechanism, an axle-shaft, a master-wheel loose thereon, to actuate the seed-dropping mechanism, supporting and traction wheels, one fast and the other loose on said shaft, a clutch to lock the master-wheel to the shaft, a spring to normally unclutch the same, a spring-pressed, normally effective clutch to lock said loose traction-wheel to the shaft, and a hand-wheel, free to revolve on a threaded portion of said shaft and between said clutches, said hand-wheel having stops on opposite sides, and said clutches having cams, coacting with said stops, substantially as described.

11. In a check-row planter, in combination with a seed-dropping mechanism, an axle-shaft, a master-wheel loose thereon, having a tappet to operate said seed-dropping mechanism, and provided with reversely-disposed measuring-scales, a fixed pointer coacting with said measuring-scales, supporting and traction wheels on said shaft, one fast and the other loose, a clutch to lock said master-wheel to said shaft, a disk free to travel longitudinally of the shaft, rods connecting said disk to said clutch, a drum fast to the shaft and through which said rods pass, a clutch to lock said loose traction-wheel to said shaft, said wheel having a disk, and a hand-wheel between said disks and free to revolve on said axle-shaft, said hand-wheel and said disks having coacting cams, substantially as described.

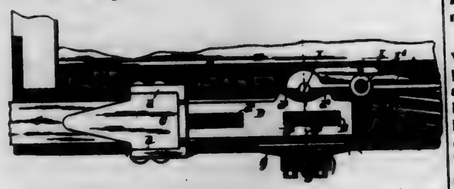
12. In a check-row corn-planter, in combination with a seed-dropping mechanism, an axle-shaft, a master-wheel, loose on said shaft, and having a tappet to operate the seed-dropping mechanism and reversely-disposed measuring-scales, a fixed pointer coacting with said measuring scales, supporting and traction wheels on said shaft, one fast and one loose, clutches to lock said master-wheel and loose traction-wheel to said shaft, and a hand-wheel, free to revolve on said shaft, said hand-wheel and clutches having coacting means to operate said clutches, substantially as described.

13. In a check-row corn-planter, in combination with a seed-dropping mechanism, an axle-shaft, a master-wheel, loose on said shaft, and having a tappet to operate the seed-dropping mechanism and reversely-disposed measuring-scales, a fixed pointer coacting with said measuring-scales, supporting and traction wheels on said shaft, one fast and one loose, clutches to lock said master-wheel and loose traction-wheel to said shaft, a hand-wheel, free to revolve on said shaft, said hand-wheel and clutches having coacting means to operate said clutches, and a hill finder-bar adapted to be extended longitudinally from the planter, substantially as described.

709,404. DRAFT-RIGGING FOR RAILWAY-CAR COUPLINGS. JAMES A. HIBBEN, Chicago, Ill. Filed Dec. 28, 1901. Serial No. 87,554. (No model.)

Claim.—1. A draft-rigging for cars comprising a draw-bar, a draw-bar spring or springs and supplemental resistance elements cooperating with said draw-bar spring or springs comprising coacting friction-surfaces at one side of the draw-bar, coacting inclined surfaces and a roller at the

other side of said bar, and a spring for holding said roller and inclined surfaces in coacting relation.



2. A draft-rigging for cars comprising a draw-bar, a draw-bar spring or springs and supplemental resistance elements coöperating with said draw-bar spring or springs comprising coacting friction-surfaces at one side of the draw bar, coacting inclined surfaces and a roller at the other side of said bar, and a spring for holding said roller and inclined surfaces in coacting relation, the pressure of said springs being exerted through the draw-bar yoke or tailpiece to said friction-surfaces to hold the same pressed one against the other.

3. A draft-rigging for cars comprising a draw-bar, a draw-bar spring or springs which are compressed through longitudinal movement of the draw-bar and supplemental resistance elements coöperating with said draw-bar spring or springs comprising coacting friction-surfaces at one side of the draw-bar, coacting oppositely-inclined surfaces, and a roller at the other side of said bar, and a spring for holding said roller and inclined surfaces in coacting relation, said inclined surfaces being connected by a curved surface formed on a greater radius than that of the roller, whereby the draw-bar spring or springs may be placed under preliminary compression prior to the operation of the supplemental resistance elements.

4. A draft-rigging for cars comprising a draw-bar provided with a tailpiece or yoke, a draw-bar spring or springs, a friction-plate on one side of said tailpiece or yoke, a coacting stationary friction-plate, a spring-pressed part at the other side of said draw-bar, and coacting parts on said spring-pressed part and the side of the draw-bar tailpiece or yoke remote from the friction-plates, comprising a roller on one of said parts and oppositely-inclined surfaces on the other part.

5. A draft-rigging for cars comprising draft-sills, a draw-bar provided with a tailpiece or yoke, a draw-bar spring or springs, a flat friction-plate on one side of said draw-bar tailpiece or yoke, a friction-plate stationary with the draft-sills and coacting with the movable friction-plate, a laterally-movable part supported on said draft-sills at the opposite side of the draw-bar, coacting parts on said part and the draw-bar tailpiece or yoke, embracing inclined surfaces on one of said parts and a spring supported on said draft-sills acting to maintain said coacting parts in operative relation.

6. A draft-rigging for cars comprising a draw-bar provided with a tailpiece or yoke, a draw-bar spring or springs, a friction-plate on one side of said draw-bar tailpiece or yoke, a coacting stationary friction-plate, a spring-pressed part at the other side of said draw-bar, and coacting parts on said spring-pressed part and the adjacent side of the draw-bar tailpiece or yoke, comprising a roller on one of said parts and oppositely-inclined surfaces on the other part, said stationary friction-plate having a limited oscillatory movement to maintain the friction-surfaces of the plates in parallelism.

7. A draft-rigging for cars comprising draft-sills, a draw-bar provided with a tailpiece or yoke, a draw-bar spring or springs, a friction-plate at one side of said draw-bar tailpiece or yoke, a stationary friction-plate supported on said draft-sills and coöperating with the movable friction-plate, a vertically-oscillatory lever supported between said draft-sills, a roller carried by said lever, oppositely-inclined surfaces on the draw-bar tailpiece or yoke coacting with said roller, and a spring supported on said draft-sills and acting on said lever to press said roller against said inclined surfaces of the draw-bar.

8. A draft-rigging for cars comprising draft-sills, a draw-bar provided with a tailpiece or yoke, a draw-bar spring or springs, a friction-plate at one side of said tailpiece or yoke, a stationary friction-plate supported on said draft-sills and coöperating with the movable friction-plate, a spring-pressed part supported between said draft-sills and a roller carried by said spring-pressed part, oppositely-inclined surfaces on the draw-bar coacting with said roller, said inclined surfaces of the draw-bar being connected by a curved surface formed on a radius greater than that of the roller.

9. A draft-rigging for cars, comprising draft-sills, a draw-bar provided with a yoke or tailpiece, a draw-bar spring or springs, a friction-plate at one side of the yoke or tailpiece, a friction-plate supported on said draft-sills and coöperating with the movable friction-plate, a spring-pressed part supported by the draft-sills, coacting parts on said spring-pressed part and the side of the yoke or tailpiece remote from the friction-plates embracing a roller on one of said parts, and inclined surfaces on the other part, one of said friction-plates having a limited or oscillatory movement with respect to its support whereby said plates may be maintained in parallelism.

10. A draft-rigging for cars comprising draft-sills, a draw-bar provided with a tailpiece or yoke, a draw-bar spring or springs, a friction-plate at one side of said tailpiece or yoke, a friction-plate supported on said draft-sills and coöperating with the movable friction-plate, an oscillatory lever supported between said draft-sills, a roller carried by said lever, oppositely-inclined surfaces on the tailpiece or yoke coacting with said roller, and a spring supported on said draft-sills and acting on said lever to press said roller against said inclined surfaces of the draw-bar, said stationary friction-plate having a limited oscillatory movement whereby said friction-plates may be maintained in parallelism.

11. A draft-rigging for cars comprising draft-sills, a draw-bar provided with a yoke or tailpiece, a draw-bar spring or springs, a friction plate on one side of said yoke or tailpiece, a bar or girder extending transversely between the draft-sills below said friction-plate, a second friction-plate carried by said bar or girder and coacting with the draw-bar friction-plate, said second friction-plate having a limited oscillatory movement on said bar, and coacting inclined surfaces and a spring-pressed roller at the other side of said yoke or tailpiece.

12. A draft-rigging for cars comprising a draw-bar, provided with a tailpiece or yoke to which the draw-bar is pivoted in a manner to swing horizontally, a draw-bar spring or springs, a friction-plate at one side of said tailpiece or yoke, a stationary friction-plate coacting with said tailpiece friction-plate, a spring-pressed part on the other side of said tailpiece, and coacting parts on the said spring-pressed part and the tailpiece, embracing oppositely-inclined surfaces on one of said parts, and a roller on the other part.

13. A draft-rigging for cars comprising draft-sills, a draw-bar, a tailpiece or yoke extending rearwardly from said car, follower-bars extending through openings in said tailpiece or yoke and through alined openings in the draft-sills, springs interposed between said follower-bars laterally outside of said draft-sills, a friction-plate at one side of said tailpiece or yoke, a coacting stationary friction-plate carried by the draft-sills, and coacting inclined surfaces and a spring-pressed roller on the other side of said tailpiece or yoke.

14. A draft-rigging for cars comprising draft-sills, a draw-bar, a tailpiece or yoke extending rearwardly therefrom, follower-bars extending through openings in said tailpiece or yoke and through alined openings in the draft-sills, springs interposed between said follower-bars laterally outside of said draft-sills, friction-plates on one side of said tailpiece or yoke, a friction-plate carried by the draft-sills, and coöperating with said friction-plate of the tailpiece or yoke, an oscillatory lever supported on said draft-sills, on the side of the tailpiece or yoke opposite to said friction-plates, a roller on said lever, inclined surfaces on the tailpiece or yoke coacting with said roller, and a spring supported on said draft-sills and acting through said lever to hold said roller in operative relation with respect to said inclined surfaces.

15. A draft-rigging for cars comprising draft-sills, a draw-bar, a tailpiece or yoke extending rearwardly from said draw-bar to which said draw-bar is pivoted in a manner to swing horizontally, follower-bars extending through openings in said tailpiece or yoke and through alined openings in the draft-sills, and springs interposed between said follower-bars laterally outside of said draft-sills.

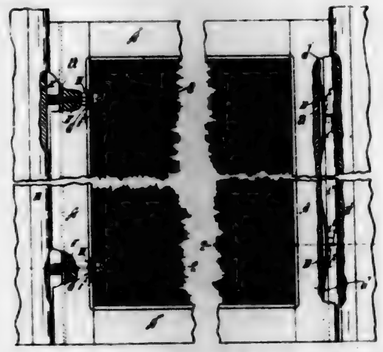
16. A draft-rigging for cars comprising draft-sills, a draw-bar, a tailpiece or yoke extending rearwardly from said draw-bar, said tailpiece or yoke being provided on its forward end with oppositely-extending lugs, plates extending rearwardly from the upper and lower sides of the draw-bar and provided with openings through which said lugs extend, follower-bars extending through openings in said tailpiece or yoke and through alined openings in the draft-sills, and springs interposed between said follower-bars laterally outside of said draft-sills.

17. A draft-rigging for cars comprising draft-sills, a draw-bar, provided with a tailpiece or yoke, follower-bars extending transversely through openings in said tailpiece or yoke and through alined openings in the draft-sills, springs interposed between said follower-bars laterally outside of said draft-sills, and bearing-plates against which the ends of said springs bear, said plates being formed on or attached to loops which embrace said follower-bars and are attached thereto.

709,405. WINDOW-SCREEN. BENJAMIN HIPOLITO, Los Angeles, Cal. Filed Feb. 13, 1899. Serial No. 705,449. (No model.)

Claim.—1. In a screened window, the combination of grooved stiles; a tongue in the groove of one stile and provided with transverse grooves extending into the tongue from one side; staples set in the tongue and extending over the mouths of the grooves respectively; bow-springs in the stile-groove and respectively fastened at one end, said tongue being

seated in the stile-groove with the staples resting upon the bow-springs; nails set through the stile and passing through the slots respectively; a tongue in the groove of the other stile; and means for adjusting the pressure of the tongues.



2. A screen comprising a frame, the stiles and rails of which are rabbeted and are provided with undercut channels extending along in the seats of the rabbets, respectively, between the edges of said seats, respectively, and sloping obliquely inward behind said seats; a wire sheet seated upon said seats and having its edges undercut into said channels; molding-strips on the wire sheet in the rabbets and respectively extending on both sides of their respective channels; and nails driven obliquely through the molding-strips into the seats respectively beyond the channels.

3. A screen comprising a frame, the stiles and rails of which are rabbeted and are provided with undercut channels extending along in the seats of the rabbets, respectively, between the edges of said seats, respectively, and sloping obliquely inward behind said seats; a wire sheet seated upon said seats and having its edges undercut into said channels; and molding-strips fastened on the wire in the rabbets and respectively extending on both sides of their respective channels.

4. In a window, the combination of a grooved stile; a tongue moving in the groove in said stile; a collar-plate; and an adjusting-screw through the plate, said screw consisting of a screw-threaded portion and a body portion, the body portion being provided at the end opposite the screw-threaded portion with an annular groove; said collar-plate being fastened to the stile on the edge thereof opposite the groove, and said adjusting-screw being inserted through a hole in the collar-plate and through a hole in the stile and screwed into the tongue and the perforated portion of the collar-plate fitting within the annular groove; the hole in said plate through which said screw is inserted being of less diameter than the body of the screw and being concealed in said annular groove by the walls of said groove.

709,406. STREET-CAR TRUCK. RAYMOND H. HORNBROOK and WILLIAM H. WOODCOCK, Canton, Ohio. Filed Apr. 22, 1902. Serial No. 104,117. (No model.)

Claim.—1. A car-truck having opposite sills of channel-iron stiffened as to their longitudinal central portions by means of depending angle-bar braces secured to the under side of the sills, substantially as specified.

2. A car-truck having the side sills of channel-iron stiffened as to their longitudinal central portions by means of depending angle-bars secured to the under sides of the sills, said side sills being connected by end angle-bars and intermediate angle-bars, substantially as specified.

3. A car-truck having the side sills composed of channel-bars with transverse bars connecting the same at the ends, and intermediate transverse angle-bars connecting the side sills and bent downward into a plane below the same, substantially as specified.

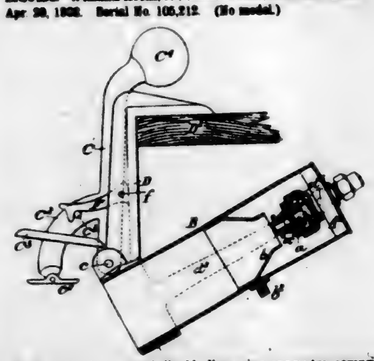
4. The combination of the side sill of the truck, with journal-box pedestals composed of a bar bent into yoke form and having projecting base-flanges, and pedestal-braces each comprising a vertical leg, a foot and a diagonal brace, the vertical leg and diagonal brace being connected at their upper ends to the sill and the foot being connected to the flanges of the yoke, substantially as specified.

5. The combination of the side sill of the truck, with journal-box pedestal-braces each comprising a vertical leg, a foot, and a diagonal brace, said vertical leg and diagonal brace being connected at their upper ends to the sill, and a bar or plate extending from the foot portion of one brace to that of the other and connected to each, substantially as specified.

6. The combination of the side sill of the truck, with journal-box pedestals composed of a bar bent into yoke form and having projecting base-flanges, pedestal-braces each comprising a vertical leg and foot, and a diagonal brace, the vertical leg and diagonal brace being connected at their upper ends to the sill and the foot being connected to the flanges of the yoke, and a bar or plate extending from one of said flanges to the other and connected to each, substantially as specified.

7. The combination of the side sills of a car-truck and the body-supporting bars at the corners of the truck, with elastic supports for said body-supporting bars each comprising a spring for supporting the bar, a plate supporting the spring, a plate resting on the sill and a pair of suspension-rods one on each side of the sill for connecting said plates, substantially as specified.

709,407. APPARATUS FOR USE IN DISPENSING AERATED LIQUIDS. WILLIAM HODER, Jr., Camden Town, London, England. Filed Apr. 30, 1902. Serial No. 105,212. (No model.)



Claim.—1. An aerated-liquid-dispensing apparatus, comprising a casing, a closing device and a charging device within the casing connected to a container and adapted to be operated by pressure against the closing device, a presser and presser-lever adapted to press an intermediate vessel in the casing against the closing device to cause the vessel to be filled, substantially as described.

2. An aerated-liquid-dispensing apparatus, comprising a casing, a closing device and a charging device within the casing connected to a container and adapted to be operated by pressure against the closing device, a presser and presser-lever adapted to press an intermediate vessel in the casing against the closing device to cause the vessel to be filled,

in combination with means for catching excess liquid expelled in the closing during the filling operation, substantially as described.

3. Apparatus for dispensing aerated liquid, comprising a casing open at one end, a pressure-operated charging device and a closing device within the closed end of the casing, and a pressure-lever pivoted to the casing and adapted to press an intermediate vessel against the closing device to operate the charging device, substantially as described.

4. An aerated-liquid-dispensing apparatus, comprising a casing, a closing device and a charging device within the casing connected to a container and adapted to be operated by pressure against the closing device, a pressure and pressure-lever adapted to press an intermediate vessel in the casing against the closing device to cause the vessel to be filled said lever having a counterweight to hold the intermediate vessel in the casing, substantially as described.

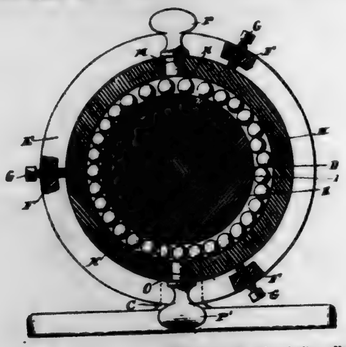
5. An aerated-liquid-dispensing apparatus, comprising a casing, a valve in the casing, a longitudinally-movable funnel in the casing adapted to convey excess expelled liquid to an intermediate vessel as it is withdrawn from the casing, said funnel being provided with an opening to fit the mouth of the intermediate vessel, substantially as described.

709,408. DEVICE FOR CUTTING OFF PIECES OF BELTS, &c. ERWIN H. JAHN, Westend, Germany, assignor to Dr. Paul Meyer Actiengesellschaft, Berlin, Germany. Filed Aug. 5, 1901. Serial No. 70,932. (No model.)

Claim.—1. In devices for cutting off pieces of belts, strips of paper, weaving, and the like, rotary cutters cooperating in pairs and both rotating around their axes, the axes of rotation being vertical to the direction of the feed and parallel to the plane of the belt, one of said knives being yielding, substantially as described.

2. In devices for cutting off pieces of belts or strips of paper, weaving or the like rotary cutters cooperating together in pairs, the axes of rotation being vertical to the direction of the feed and parallel to the plane of the belt, both cutters *e*, *f* being of spiral form, the one of which *e* is firmly fixed in its roller *h* and the other *f* is pressed by a spring *m* against the edge of the cutter *e*, substantially as set forth and described.

709,409. MACHINE FOR REDUCING AND FINISHING HOLLOW BALLS. ALLEN JOHNSON, Ottumwa, Iowa. Filed Sept. 20, 1901. Serial No. 75,903. (No model.)



Claim.—1. In a machine for rolling hollow bearing-balls, a disk having a grooved periphery and mounted for rotation and a ring having a grooved inner face, said ring held closer to one side of the periphery of said disk than to the other side thereof, together with means whereby the balls may be discharged after they have been rolled around the disk a plurality of times and through each rolling are reduced on their several axes to the desired size and finish.

2. In a machine for rolling hollow bearing-balls a disk having a grooved periphery and mounted for rotation, and a ring having a grooved inner face and mounted eccentrically thereto, means for varying the eccentricity, together with means whereby the balls may be discharged after they have been rolled around the disk a plurality of times and through each rolling are reduced on their several axes to the desired size and finish.

3. In a machine for rolling hollow bearing-balls, a disk having a grooved periphery and mounted for rotation, and a ring having a grooved inner face, said ring held closer to one side of the periphery of said disk than to the other side thereof, means for retaining the balls between the same, together with means whereby the balls may be discharged after they have been rolled around the disk a plurality of times and through each rolling are reduced on their several axes to the desired size and finish.

4. In a machine for rolling hollow bearing-balls, a disk having a grooved periphery and mounted for rotation, a ring having a grooved inner face surrounding said disk and arranged to roll a contacting series of balls repeatedly and successively and means for adjusting the inner face of said ring relative to the periphery of said disk, and means for discharging the balls.

5. In a machine for rolling hollow bearing-balls, a casing having an annular face, lugs on the edge thereof, screws in said lugs, a ring having its inner face grooved, a disk with a grooved periphery mounted within said ring, means for rotating said disk and means whereby a plurality of balls may be discharged after they have rolled around the disk a predetermined number of times and have been reduced on their several axes to the required size and finish.

6. In a machine for rolling hollow bearing-balls, a grooved ring, a disk arranged to rotate within the ring, an opening to receive a series of balls in the groove between the ring and disk and means whereby each individual ball is assisted through the wider portion of said groove by impact of succeeding balls as they are passed from the narrower portion of said groove and are thus rolled and in turn advanced in the groove.

7. In a machine for rolling hollow bearing-balls, a grooved disk, a grooved ring eccentrically mounted opposite the periphery of said disk, an opening in said ring to receive the balls between the ring and disk, and means to permit the discharge of the balls or to discontinue their discharge.

8. In a machine for rolling hollow bearing-balls, in combination with a suitable pedestal and a circular plate bored to receive a shaft; a disk fixedly mounted on said shaft, a groove on the edge of said disk, a grooved ring mounted outside said disk and held in an eccentric relation thereto by means of screws inserted through projections on the edge of said circular plate, openings in said ring at the top and bottom of the machine to permit ingress and egress of the spherical bodies, and screw-plugs adapted to rest in said openings.

9. In a machine for rolling hollow bearing-balls, a disk having a grooved periphery, a ring eccentrically surrounding said disk and formed with a grooved inner face, adjusting means for varying the divergence or eccentrical arrangement of said ring relative to the periphery of said disk whereby such a number of balls may be repeatedly and successively rolled in the groove between the disk and ring as will cause those balls being moved in the narrower portion of the groove to push forward those balls in the wider part of the groove until, by reason of the converging space, each ball in turn becomes self-propelling.

10. In a machine for rolling hollow bearing-balls, a rotatable disk having a grooved periphery, a ring eccentrically surrounding said disk and formed with a grooved inner face and adjusting means for varying the divergence or eccentrical arrangement of the inner face of said ring relative to the periphery of said disk, whereby a series of balls may be repeatedly and successively rolled, between gradually-converging surfaces, to a predetermined size and finish through their various axes.

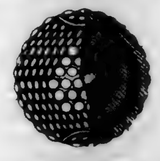
11. In a machine for rolling hollow bearing-balls, a disk having a grooved periphery and mounted for rotation, a ring having a grooved inner face secured eccentrically in relation to said disk, said disk and ring combined to roll a series of balls repeatedly and successively through the gradually-narrowing space between them with positive predetermined pressure.

709,410. DENTAL BRIDGEWORK. JOHN L. KELLY, St. Paul, Minn. Filed Nov. 21, 1901. Serial No. 83,211. (No model.)

Claim.—1. An improvement in removable dental bridgework, the same consisting of a holding-post rigid with and projecting beyond the surface of the root-crown, and a bridge-cap carried by the bridge and telescopically registering with said post.

2. An improvement in removable dental bridgework, the combination with a root crown-cap having no projection above the gum and provided with a top flat supporting-surface, a cup-like holding-post soldered upon and projecting beyond the said flat supporting-surface, and a cap-like bridge-cap carried by the bridge and telescopically registering with the said post.

709,411. PLAYING-BALL. ELEAZER KEMPSHALL, Boston, Mass. Filed May 26, 1902. Serial No. 108,923. (No model.)



Claim.—1. A playing-ball comprising a spherical center piece, and a body composed of spherical windings of elastic material and a composite cord.

2. A playing-ball comprising a spherical center piece, and a body composed of alternating spherical envelops of windings of elastic material and a composite cord.

3. A playing-ball comprising a spherical center piece of hard elastic material and a body composed of spherical windings of elastic material and a composite cord.

4. A playing-ball comprising a spherical center piece of hard elastic material, and a body composed of alternating spherical envelops of windings of elastic material and a composite cord.

5. A playing-ball comprising a spherical center piece of gutta-percha, and a body composed of spherical windings of elastic material and a composite cord.

6. A playing-ball comprising a spherical center piece of gutta-percha, and a body composed of alternating spherical envelops of windings of elastic material and a composite cord.

7. A playing-ball comprising a spherical center piece, and a body composed of spherical windings of rubber thread and a composite cord.

8. A playing-ball comprising a spherical center piece, and a body composed of alternating spherical envelops of windings of rubber thread and a composite cord.

9. A playing-ball comprising a spherical center piece of hard elastic material, and a body composed of spherical windings of rubber thread and a composite cord.

10. A playing-ball comprising a spherical center piece of hard elastic material, and a body composed of alternating spherical envelops of windings of rubber thread and a composite cord.

11. A playing-ball comprising a spherical center piece of gutta-percha, and a body composed of spherical windings of rubber thread and a composite cord.

12. A playing-ball comprising a spherical center piece of gutta-percha, and a body composed of alternating spherical envelops of windings of rubber thread and a composite cord.

13. A playing-ball comprising a spherical center piece, and a body composed of spherical windings of elastic material and a cord having a sheathing of a derivative of pyroxylin.

14. A playing-ball comprising a spherical center piece, and a body composed of alternating spherical envelops of windings of elastic material and a cord having a sheathing of a derivative of pyroxylin.

15. A playing-ball comprising a spherical center piece of hard elastic material, and a body composed of spherical windings of elastic material and a cord having a sheathing of a derivative of pyroxylin.

16. A playing-ball comprising a spherical center piece of hard elastic material, and a body composed of alternating spherical envelops of windings of elastic material and a cord having a sheathing of a derivative of pyroxylin.

17. A playing-ball comprising a spherical center piece of gutta-percha, and a body composed of spherical windings of elastic material and a cord having a sheathing of a derivative of pyroxylin.

18. A playing-ball comprising a spherical center piece of gutta-percha, and a body composed of alternating spherical envelops of windings of elastic material and a cord having a sheathing of a derivative of pyroxylin.

19. A playing-ball comprising a spherical center piece, and a body composed of spherical windings of elastic material and a cord having a sheathing of celluloid.

20. A playing-ball comprising a spherical center piece, and a body composed of alternating spherical envelops of windings of elastic material and a cord having a sheathing of celluloid.

21. A playing-ball comprising a spherical center piece of hard elastic material, and a body composed of spherical windings of elastic material and a cord having a sheathing of celluloid.

22. A playing-ball comprising a spherical center piece of hard elastic material, and a body composed of alternating spherical envelops of windings of elastic material and a cord having a sheathing of celluloid.

23. A playing-ball comprising a spherical center piece of gutta-percha, and a body composed of spherical windings of elastic material and a cord having a sheathing of celluloid.

24. A playing-ball comprising a spherical center piece of gutta-percha, and a body composed of alternating spherical envelops of windings of elastic material and a cord having a sheathing of celluloid.

25. A playing-ball comprising a spherical center piece, and a body composed of spherical windings of rubber thread and a cord having a sheathing of plastic material.

26. A playing-ball comprising a spherical center piece, and a body composed of alternating spherical envelops of windings of rubber thread and a cord having a sheathing of plastic material.

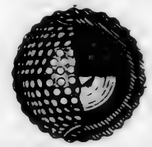
27. A playing-ball comprising a spherical center piece of hard elastic material, and a body composed of spherical windings of rubber thread and a cord having a sheathing of plastic material.

28. A playing-ball comprising a spherical center piece of hard elastic material, and a body composed of alternating spherical envelops of windings of rubber thread and a cord having a sheathing of plastic material.

29. A playing-ball comprising a spherical center piece of gutta-percha, and a body composed of spherical windings of rubber thread and a cord having a sheathing of plastic material.

30. A playing-ball comprising a spherical center piece of gutta-percha, and a body composed of alternating spherical envelops of windings of rubber thread and a cord having a sheathing of plastic material.

709,412. PLAYING-BALL. ELEAZER KEMPSHALL, Boston, Mass. Filed July 5, 1902. Serial No. 114,433. (No model.)



Claim.—1. A playing-ball comprising a core made up partially of windings of elastic belting, said elastic belting being cemented together with celluloid cement, and a shell of celluloid holding said core under compression.

2. A playing-ball comprising a yielding core, windings of elastic belting miscellaneously applied to said core, said belting being cemented together, and a shell consisting of plastic material and metal holding said core under compression.

3. A playing-ball comprising a rubber core, elastic belting wound thereon in different directions, celluloid cement holding layer upon layer, and a shell of celluloid and metal holding said core under compression.

4. A playing-ball comprising a rubber core, elastic belting wound thereon in different directions, said belting being fixed with celluloid cement and adhering one layer to another, and a shell composed of layers of plastic material and metal holding said core under compression.

5. A playing-ball comprising a rubber core, elastic belting wound thereon in different directions, said belting being fixed with celluloid cement and adhering one layer to another, a shell comprising layers of celluloid, and a hard perforated material holding said core under compression.

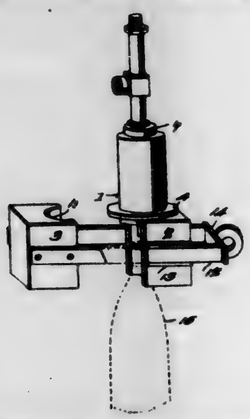
709,418. BOTTLE FILLING AND CORKING MACHINE. WILLIAM B. LARDAR, Hawley, Pa. Filed Mar. 22, 1902. Serial No. 99,466. (No model.)

Claim.—1. In a machine of the class described, the combination of a head adapted to receive the neck of a receptacle, a combined filling-tube and plunger extending into the head, one of the parts being movable, whereby the filling-tube is adapted to operate as a plunger, and means located within the head and mounted independently of the said tube for automatically swinging the stopper of a bottle over the neck when the tube is withdrawn from the bottle, substantially as described.

2. In a machine of the class described, the combination of a head having a casing adapted to receive the neck of a bottle, a filling-tube extending into the casing and capable of vertical movement and adapted to operate as a plunger, and means for automatically swinging the stopper of a bottle over the neck when the filling-tube is raised, substantially as described.

3. In a machine of the class described, the combination of a head having a casing arranged to receive the neck of a bottle, a combined filling-tube and plunger extending into the casing and capable of vertical

movement, and means for automatically swinging the stopper of a bottle over the neck when the tube is withdrawn from the bottle, substantially as described.



4. In a machine of the class described, the combination of a head adapted to receive the neck of a bottle, a vertical filling-tube extending into the head, one of the parts being vertically movable with relation to the other, whereby the filling-tube is adapted to operate as a plunger, and a spring carried by the head and arranged to swing a stopper automatically over the neck of a bottle when the tube is withdrawn from the latter, substantially as described.

5. In a machine of the class described, the combination of a head, a vertically-movable combined filling-tube and plunger, a spring arranged within the head and adapted to engage a stopper to swing the same over the neck of a bottle when the tube is withdrawn therefrom, and a support arranged to receive the stopper to limit the movement thereof, substantially as described.

6. In a machine of the class described, the combination of a head having a casing provided with a movable portion adapted to be opened to afford access to its interior, a vertically-movable combined filling-tube and plunger, and a spring arranged within the casing and adapted to automatically swing a stopper over the neck of a bottle when the tube is withdrawn from the latter, substantially as described.

7. In a machine of the class described, the combination of a head having a casing composed of stationary and movable sections, a frame slidably mounted on the stationary section and connected with the movable section, a vertically-movable combined filling-tube and plunger, and means arranged within the casing for automatically swinging the stopper of a bottle over the neck of the same when the tube is withdrawn therefrom, substantially as and for the purpose described.

8. In a machine of the class described, the combination of a head having a cylindrical upper portion and provided at its lower portion with a casing composed of stationary and movable sections, a block or support carried by the stationary section, a spring mounted on the movable section and arranged to engage a bottle-stopper, and a combined filling-tube and plunger, substantially as described.

9. In a machine of the class described, the combination of a head adapted to receive the neck of a receptacle, a vertically-movable combined filling-tube and plunger, and means for automatically swinging the stopper of the receptacle over the neck thereof when the tube is withdrawn therefrom, substantially as and for the purpose described.

10. In a machine of the class described, the combination of a head having a casing, a vertically-movable combined filling-tube and plunger, and a movable stopper support and carrier mounted within the casing independently of the tube and arranged to swing the stopper of a bottle over the latter when the tube is withdrawn therefrom, substantially as described.

11. In a machine of the class described, the combination of a head having a casing, a vertically-movable combined filling-tube and plunger, a movable stopper support and carrier mounted on the casing and arranged within the same, and a spring arranged to swing the stopper automatically over the neck of a bottle when the tube is withdrawn therefrom, substantially as described.

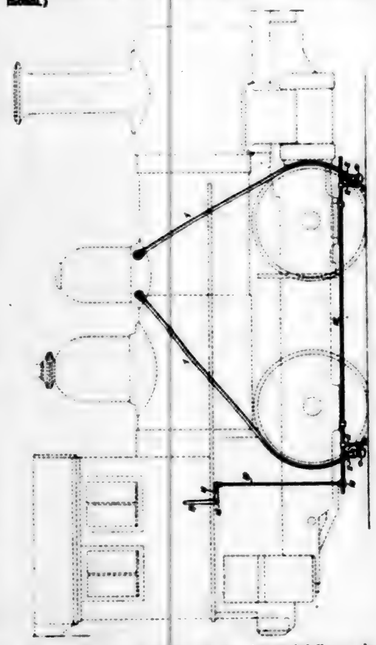
12. In a machine of the class described, the combination of a head, a vertically-movable combined filling-tube and plunger, a vertically-movable pivotally-mounted stopper support and carrier, and a spring arranged to swing the stopper automatically over the neck of a bottle when the tube is withdrawn therefrom, substantially as described.

13. In a machine of the class described, the combination of a head having a casing, a combined filling-tube and plunger, a stopper support and carrier provided with an engaging portion and adapted to hold a movable stopper, a link pivotally connected to the support and carrier and to the casing, and a spring for automatically swinging the stopper support and carrier, substantially as described.

14. In a machine of the class described, the combination of a head, a combined filling-tube and plunger, a stopper support and carrier provided with a claw or engaging portion, a link pivotally connected with the stopper support and carrier and pivotally mounted, and springs for engaging the link and for swinging the stopper support and carrier, substantially as described.

15. In a machine of the class described, the combination of a head having a casing, a combined filling-tube and plunger, an approximately U-shaped stopper-supporting carrier provided at the top with a claw, links connecting the sides of the stopper support and carrier with the casing, and springs for engaging the stopper support and carrier for swinging a stopper over the neck of a bottle and for swinging the links upward, substantially as described.

709,414. LOCOMOTIVE SAND-DELIVERING PIPE. ISAAC T. LEWIS, Philadelphia, Pa. Filed Oct. 16, 1901. Serial No. 78,886. (No model.)



Claim.—1. The combination of opposite sand-delivery pipes of a locomotive, a transversely-swinging nozzle at the delivery end of each pipe, a transverse rod connecting said nozzles, a longitudinal rock-shaft having an arm connected to said rod, and connections from said rock-shaft to the cab of the locomotive, substantially as specified.

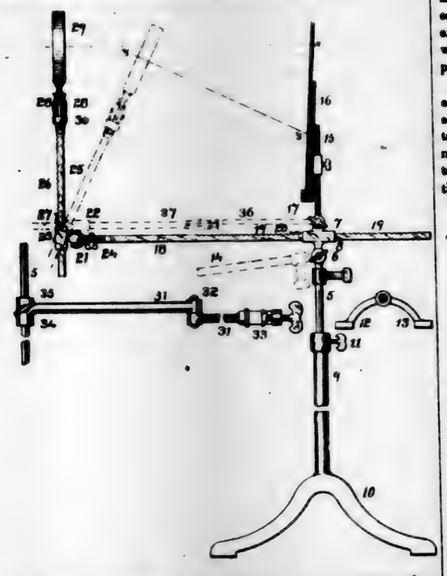
2. A locomotive sand-pipe curved to conform to the wheel and having secured to its lower end a fixed nozzle with vertical delivery end, and a nozzle mounted thereon so as to swing in a direction transversely to the rail, substantially as specified.

3. The combination of a locomotive sand-pipe with a fixed nozzle secured thereto and having a delivery portion with fore and aft trunnions projecting therefrom and a swinging delivery-nozzle having sockets for the reception of said trunnions, substantially as specified.

709,415. GRAPHOSCOPE. LEOPOLD LEWIS, New York, N. Y. Filed June 6, 1902. Serial No. 110,583. (No model.)

Claim.—1. In a graphoscope, the combination of a picture-rack 16, a lens 29, a frame 18, a socket 7, a rod 5, and a stand 10 with a lens-holder 25, mounted on a universal joint, substantially as described.

2. In a graphoscope, the combination of a picture-rack 16, a lens 29, a lens-holder 25, a frame 18, a rod 5, and a stand 10; with a support 31 for the graphoscope having a clamp 33, for attachment to an easel or the like, and independent of the said stand 10, legs 12 and 13 and a rack 31 having a clamp 33, substantially as described.



3. In a graphoscope the combination of a lens, a picture-rack, a frame, and means for focusing; together with means for bringing the center of the said lens opposite any part of the picture to be viewed, substantially as described.

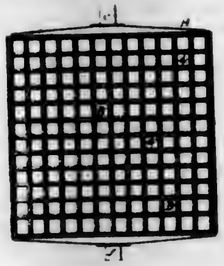
4. In a graphoscope, the combination of a lens, a picture-rack, a frame, and means for focusing; together with means for moving the principal axis of the lens to impinge on any point of the picture to be viewed, substantially as described.

5. In a graphoscope the combination of a lens, a picture-rack, a frame, means for focusing; together with a universal joint for changing the relative positions of the said lens and said picture-rack, substantially as described.

6. In a graphoscope the combination of a lens, a picture-holder, a frame, and means for focusing; together with means for adjusting the relative lateral and vertical positions of the said lens and the said picture-holder, substantially as described.

7. In a graphoscope the combination of a lens, a picture-holder, a frame, and means for focusing; together with means for bringing the principal axis of said lens into any plane passing through the picture and the center of the said lens, substantially as described.

709,416. COOLING AND CONDENSING APPARATUS. WILHELM A. MAYBACH, Cannstadt, Germany, assignor to Daimler Manufacturing Company, New York, N. Y., a Corporation of New York. Filed Mar. 22, 1901. Serial No. 53,241. (No model.)

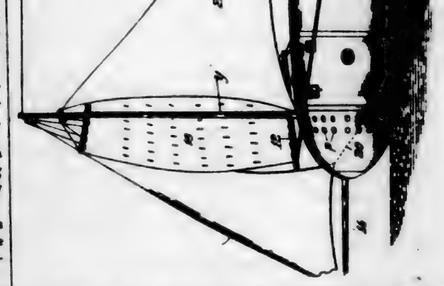


Claim.—1. The combination of a frame having screens at each end formed by wires crossing each other and tubes extending from one screen to the other, said tubes being secured to the wires and forming a chamber for the fluid to be cooled, substantially as described.

2. The combination of a frame having an inlet-pipe at one end, and an outlet-pipe at the other end, a series of wires crossing each other at each end of the frame forming supports, with prismatically-shaped tubes extending from one side of the frame to the other and separated by the wires, the wires spacing the tubes so as to form narrow channels for the passage of fluid through the apparatus, substantially as described.

3. The combination in a cooling apparatus of a frame, a screen at each end thereof formed by wires crossing each other, the meshes of the screen so formed being quadrangular in form with quadrangular tubes extending through one screen to the other and secured to the same, the side members of the frame extending a certain distance away from the said tubes thereby forming a distributing-chamber, and inlets and outlets to the chamber thus formed, substantially as described.

709,417. LIFE-BOAT. ROBERT D. MAYO, Frankfort, Mich. Filed Mar. 25, 1901. Serial No. 53,780. (No model.)



Claim.—1. In a life-boat of the class described, the combination of an outer rotatable shell, a foldable centerboard pivotally attached thereto, means for folding the centerboard against the side of the shell and permitting it to swing into operative position, an inner pendulous carriage rotatably mounted in the shell, and means for locking the pendulous carriage to the shell in any desired position with relation to the outer-board, substantially as described.

2. In a life-boat of the class described, the combination of an outer rotatable shell, a foldable centerboard pivotally secured thereto, means for swinging the centerboard into and out of operative position, a pair of transverse bulkheads arranged at each end of the shell forming an inner compartment between them, a pendulous carriage in each inner compartment movably mounted upon the bulkheads, and means for locking the pendulous carriage to the rotatable shell in any desired position with relation to the centerboard, substantially as described.

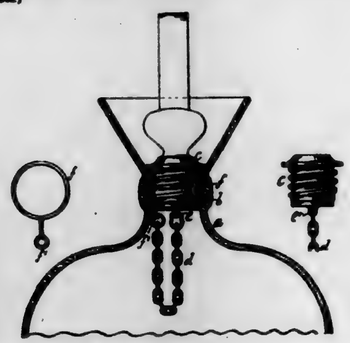
3. In a life-boat of the class described, the combination of an outer rotatable shell, an inner pendulous carriage, a foldable centerboard secured longitudinally to the outer rotatable shell to be opened or closed, means for locking the pendulous carriage to the shell in any desired position with relation to the centerboard when the centerboard is in its open position, a transverse partition in the shell provided with openings extending therethrough, and means passed down through such openings and connected with the foldable centerboard by which such board may be opened and closed, substantially as described.

4. In a life-boat of the class described, the combination of an outer

rotatable shell provided with two or more transverse partitions forming a living-compartment therein, a multiplicity of sheave-pulleys on the inner side of such bulkheads or partitions, a pendulous carriage, and a cable, cord, or similar element secured to the pendulous carriage and passed over a plurality of such sheave-pulleys to swingingly hold such carriage in the desired position, substantially as described.

5. In a life-boat of the class described, the combination of an outer rotatable shell, a foldable counterboard pivotally secured longitudinally thereto and arranged to be folded against the shell or opened into operative position, a pendulous carriage, means for locking the pendulous carriage and the rotatable shell together to form a balance or compensation for the list of the boat, seats arranged to be secured to the annular shell, and rails for such seats substantially as described.

709,418. BOTTLE-STOPPER. CHRISTIAN W. HEINEKE, Jersey City, N. J., assignor to Meinecke and Company, New York, N. Y., a Corporation of New Jersey. Filed Apr. 21, 1902. Serial No. 104,597. (No model.)

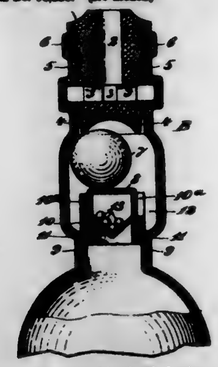


Claim.—1. A bottle or vessel having a threaded bushing and a stopper adapted to screw into the bushing, an attaching wire or ring secured about the bushing, and a chain connected to the wire and to the bottom of the stopper.

2. A bottle or vessel provided with a stopper having a button-like projection at its under side, a swivel connection on said projection, and a securing-chain for the stopper connected at one end to the swivel connection and at its other end secured to the interior of the bottle.

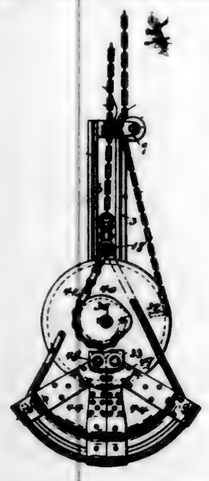
3. A bottle or vessel having a threaded bushing secured in the neck thereof, a threaded stopper adapted to engage the bushing and provided on its lower face with a button-like projection, a swivel connection on said projection, a securing-chain for the stopper connected at one end with said swivel connection, and means connected to the bushing and attached to the other end of said chain for securing the chain within the interior of the bottle or vessel.

709,419. BOTTLE. JOHN O'CONNOR, New York, N. Y., assignor of one-half to John Goodchild, guardian, New York, N. Y. Filed Mar. 1, 1902. Serial No. 96,265. (No model.)



Claim.—The combination with a bottle having a neck integral with the body and provided at its lower end with a ledge 9 and a internally-expanded portion above said ledge to form a chamber 12, of the plug 1 mounted in the neck, said plug having a central bore 2, lateral passages 3 therefrom, and a concave inner end which is of reduced diameter so as to form an annular passage 4 within the neck, the glass valve-seat 10, recessed at its lower end and provided with a cork packing 11 which rests on the ledge 9, said valve-seat having a coned seating for the valve and triangular upright guides 10ª, the hollow glass valve 8, on said seat and containing a loose jar, and the glass ball 7 on the valve and caged between it and the inner end of the plug 1, the chamber 12 extending from a point below the conical seating for the valve up to and communicating with the annular passage 4, as and for the purposes set forth.

709,420. DREDGING-BUCKET. CHARLES PAY, Providence, R. I. Filed May 16, 1902. Serial No. 107,630. (No model.)



Claim.—1. In a dredging-machine, the combination of a bucket consisting of two sections or scoops, each of which has straight parallel sides and also a segmental-shaped bottom, said scoops pivotally mounted on a proper support, bail-arms connected with said scoops respectively at the digging edge of each, and means adapted to operate said arms for the purpose of opening and closing said scoops, substantially as shown and described.

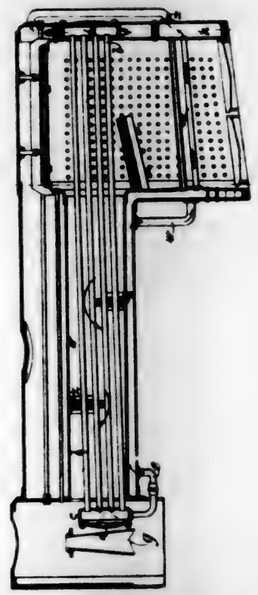
2. In a dredging-machine, the combination of a bucket comprising two scoops pivotally mounted on a proper support, a properly-mounted cam-shaft, a pulley fixed on said shaft, two cams fixed on said shaft and each having a volute periphery, a lifting-bar, bail-arms mounted on said bar and connected with said scoops respectively, a chain adapted to raise and lower said bar, a chain adapted to rotate said pulley, and two chains mounted on said bar and adapted to operate said cams respectively, substantially as specified.

3. In a dredging-machine having a suitable frame provided with guideways, and two cast-steel blocks each of which is rigidly secured at the lower portion of said frame, in combination therewith, of a bucket comprising two scoops pivotally mounted on said blocks, a shaft rotatably mounted on said blocks, two cams rigidly secured on said shaft and each having a volute periphery, a lifting-bar movable in the guideways of said frame, bail-arms mounted on said bar and connected to said scoops respectively at the centers of the digging edge of each and means adapted to operate said arms in opening and closing said scoops, substantially as shown and described.

4. In a dredging-machine having suitable guideways, the combination therewith, of cast-steel blocks movable in said guideways, the lifting-bar, the shaft attached to said bar and having its ends mounted in said blocks, the bucket comprising two pivotally-mounted scoops, and arms extending from said shaft to said scoops, respectively, substantially as specified.

5. In a dredging-machine having suitable guideways, the combination therewith, of cast-steel blocks each of which is made in one piece and secured to said guideways between the lower portion thereof, a cam-shaft mounted rotatably in said blocks, and a bucket comprising two scoops pivotally mounted on said blocks and suspended beneath the said cam-shaft, substantially as shown and described.

709,421. STEAM-GENERATOR OF THE LOCOMOTIVE TYPE. HARRY FLOWERS, London, England. Filed Apr. 24, 1902. Serial No. 104,515. (No model.)



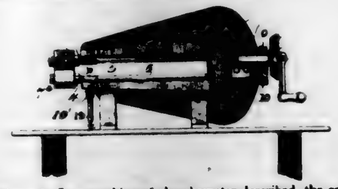
Claim.—1. In a steam-generator of the fire-tube type, a generator-body having a fireplace and a vertically-disposed combustion-chamber at one end, a plurality of fire-tubes extending horizontally from said chamber, a fire-flue located in proximity to said tubes, a plurality of water-tubes extending through the fire-flue and combustion-space, headers connected to said water-tubes at each end, a plurality of water-tubes extending above the grate, headers connecting the ends of said last-named tubes and connections from said headers to the steam or water spaces of the generator, substantially as described.

2. In combination with the fire-flue and combustion-space of a fire-tube generator, of a ring cutting off part of the water-space, a group of water-tubes passing through said flue, a header at each end to which said tubes are connected, and a bridge-piece and bolts with blank end nuts for clamping one of said headers to the ring, substantially as described.

3. The combination with the fire-flue and combustion-space of a fire-tube generator, of a ring cutting off part of the water-space, a group of water-tubes passing through said flue, a header at each end to which said tubes are connected, removable covers for said headers, and a bridge-piece and bolts with blank end nuts for clamping one of said headers to the ring, substantially as described.

4. In a steam-generator of the cylindrical marine type, the combination with the fire-flue and combustion-space, of a group of water-tubes passing through said flue and the upper part of the combustion-space, a second group of water-tubes in proximity to the fire-bed, headers at each end for each group of tubes, and connections from said headers to the steam and water space of the generator, substantially as described.

709,422. EMBOSSING-MACHINE. FRANK K. RUSSELL, Dallas, Tex. Filed Jan. 3, 1901. Serial No. 41,905. (No model.)



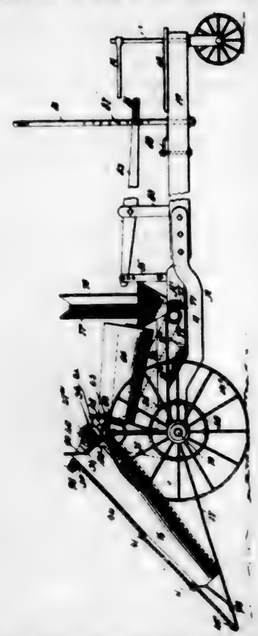
Claim.—1. In a machine of the character described, the combination of upper and lower geared roll-shafts and means for rotating the same, of a series of impression-rolls mounted upon said upper roll-shaft, the center one of which being fixedly mounted thereon and the rest loosely mounted thereon, a bearing or pressure roll fixed on said lower roll-shaft and adapted to bear upon said impression-rolls, and means for regulating the pressure of said bearing or pressure roll, substantially as and for the purpose described.

2. In an embossing-machine provided with a suitable frame and upper and lower geared roll-shafts mounted therein; a series of impression-rolls mounted upon said upper roll-shaft, the center one of which being fixedly mounted thereon and the rest loosely mounted thereon whereby in making carved figures upon leather or other material the roll or rolls between the center of the figures or impressions and said fixed roll will be permitted to run slower than the fixed roll and the roll or rolls outside of the fixed roll will be permitted to run faster than said fixed roll, a suitable bearing mounted on the lower roll-shaft, and means for operating the machine.

709,423. ROUGH BOX FOR BURIAL-CASKETS. PATRICK D. SEARER, Syracuse, N. Y. Filed Mar. 17, 1902. Serial No. 98,560. (No model.)

Claim.—A rough box for burial-casket formed from a sheet-metal blank which consists of a rectangular central section constituting the bottom of the box, side and end sections bent up from the central section and constituting the side and end walls of the box, the ends of the side walls bent at right angles and lapped onto the end walls, rivets passing through said lapping parts, the top portions of said walls bent horizontally outward and forming the seat of the lid, a metal band embracing the box and abutting with its top edge against the under side of said seat, and rivets fastening said band to the box substantially as set forth and shown.

709,424. CORN-HARVESTER. JOHN SYLAND, Mankato, Kans. Filed Aug. 2, 1901. Serial No. 70,533. (No model.)



Claim.—1. In a corn-harvester, a wheel-supported frame, snapping rollers mounted in the frame to revolve in opposite directions, a housing for each snapping-roller, a trough within each housing parallel with the

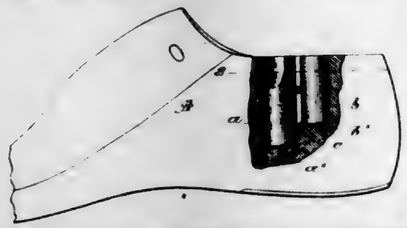
outer sides of the snapping-rollers, and endless conveyers mounted to travel in each trough, arms supported opposite the rear end of each trough, and disk cutters mounted to revolve on said arms, adapted to slit the husks of corn as the ears drop from the conveyer, and thus prepare the ears for ready husking, as described.

2. In a corn-harvester, the combination with a wheel-supported frame, snapping-rollers mounted to revolve in the frame, housings for the snapping-rollers, guide-fingers extending from the forward ends of the housings, troughs in the said housings parallel with the outer side faces of the snapping-rollers, and endless conveyers mounted to travel in the troughs, of arms secured opposite the outlet ends of the troughs, disk cutters carried by said arms and located in the path of the ears discharged by the conveyers, husking-rollers arranged in pairs, one pair at the rear of and below the outlet end of each conveyer-trough, the husking-rollers receiving ears for contact with the slitting-disks, a trough arranged to receive the ears of corn from the husking-rollers, and an elevator in connection with the receiving-trough, all combined for the purpose set forth.

3. In a corn-harvester, the combination, with a wheel-supported main frame, an auxiliary frame pivotally carried by the main frame, and means for raising and lowering the said auxiliary frame at its rear portion, of housings located at the forward portion of the auxiliary frame and supported thereby, the housings being open at their opposing longitudinal faces and provided with guide-fingers at their forward ends, snapping-rollers mounted to revolve in the said housings, the snapping-rollers being provided with longitudinal teeth or ribs, means for driving the said rollers in opposite directions, conveyers located also within the housings or casings at the outer side portions of the snapping-rollers, a driving mechanism for the said conveyers, husking-rollers arranged in pairs, also mounted in the auxiliary frame and arranged to receive the ears delivered by the conveyers, a driving mechanism for the said husking-rollers, and an elevator carried also by the auxiliary frame and adapted to receive the cleaned ears from the husking-rollers, as set forth.

4. In a corn-harvester, the combination, with a wheel-supported main frame, an auxiliary frame pivotally mounted in the main frame, means for raising and lowering the rear portion of the auxiliary frame, housings or casings having a forward and downward inclination, their opposing inner longitudinal surfaces being open, guide-fingers carried by the forward ends of the said casings, and conveyor-chains for the stalks mounted upon the housings or casings adjacent to their inner longitudinal edges, of snapping-rollers, mounted in the housings or casings, means for revolving said snapping-rollers in opposite directions, each snapping-roller being of greater diameter at its rear than at its forward end and provided with longitudinal peripheral teeth or ribs, conveyers located also within the housings or casings adjacent to the outer side faces of the snapping-rollers, tension-controlled knives supported over the delivery ends of the conveyers, husking-rollers arranged in pairs having a downward and rearward inclination, each pair of husking-rollers having their rear ends of greater diameter than their forward ends, one roller of each pair being plain and the other roughened, tension devices for the husking-rollers, means for driving the said husking-rollers, an elevator arranged to receive the ears of corn from the husking-rollers, and means, substantially as described, for driving said elevator, for the purpose specified.

709,425. LAST. ARTHUR B. TAYLOR, Worcester, Mass., assignor to R. L. Golbert & Company, Worcester, Mass., a Copartnership. Filed Mar. 24, 1902. Serial No. 99,585. (No model.)



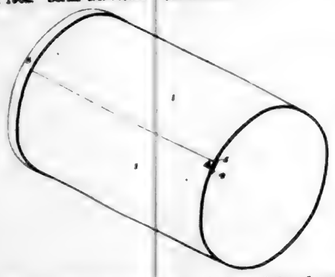
Claim.—1. A last having embedded in its heel an insert composed of a spindle-socket and impact-post formed in a single piece and terminating, respectively, at different depths within the last, the bottoms thereof resting on the solid wood of the last at right angles to the length thereof in different and approximately parallel planes.

2. A last having its heel portion provided with a single insert composed of two cylindrical parts of different lengths joined by a web part, the longer of said parts being hollow to constitute a spindle-socket, and the bottoms of said cylindrical parts resting flat upon the wood of the last in different horizontal planes.

3. A last having its heel portion provided with a single insert composed of two cylindrical parts of different lengths joined by a web part, the longer of said parts being hollow to constitute a spindle-socket, the bottoms of said cylindrical parts resting flat upon the wood of the last in different horizontal planes, and a retaining device extending transversely through said web part and the adjacent wood of the heel.

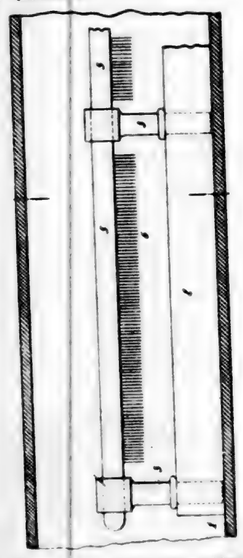
4. A last having its heel portion provided with a spindle-socket and impact-post joined integrally by a narrow part, said post being shorter than said socket, solid, and substantially the same size in cross-section as the socket, both being tightly set into the wood, the latter surrounding the same integrally on all sides, presenting a smooth integral surface of wood to bear against the shoe, and the inserted parts affording an extended metal bearing-surface at the top of the heel and having extended bearings in different horizontal planes within said heel portion.

709,426. SHEET-METAL CAN. FRANK TYSON, Philadelphia, Pa., assignor of one-half to George H. Colket, Philadelphia, Pa. Filed Mar. 19, 1902. Serial No. 99,008. (No model.)



Claim.—A sheet-metal can having a body consisting of a strip of metal bent into cylindrical form and having an overlapping flush joint, and heads having flanges which overlap the body at each end, the overlapping portion of the body-strip having tongue-and-slot connections which are entirely within the limits of the flanges of the heads, substantially as specified.

709,427. OZONIZING APPARATUS. ALEXANDER VOSMAER, Haarlem, Netherlands, assignor to Company Ozon Maatschappy Systeem A. Vosmaer, Amsterdam, Netherlands. Filed Oct. 4, 1901. Serial No. 77,546. (No model.)



Claim.—1. In an ozonizing apparatus, the combination of metal bars of suitable section, insulating-supports fixed on the said bars, metal rods supported by the said insulating-supports and having depending points and a horizontally-arranged casing, each metal bar with its insulating-supports and the metal rod carried by the said supports forming a single structure which is loosely placed in the casing, substantially as described and for the purpose set forth.

2. In an ozonizing apparatus in combination metal bars of suitable section, insulating-supports fixed at intervals in the said bars and being provided with a fork at their upper part, rods with points resting in the forks of the insulating-supports and horizontally-arranged casings in which the metal bars supporting the rods with points through the insulating-supports, are loosely placed substantially as described and for the purpose set forth.

709,428. HYDROCARBON-FEEDER FOR EXPLOSIVE-ENGINES. FRANKLIN B. WARRING, San Jose, Cal., assignor to Otten's Foundry and Machine Company, San Jose, Cal. Filed Apr. 3, 1901. Serial No. 54,152. (No model.)

Claim.—1. The combination with a carburetor of an engine, of a casing having separate interior oil-supply and vacuum chambers, the latter having connection with the carburetor and having also an end opening, a valve-stem movable in said casing, a valve carried by said stem and controlling a port between the oil-supply and vacuum chambers, a piston on said stem within the vacuum-chamber, a retracting-spring connected with the said stem, and a guide for the opposite end of the valve-stem, all substantially as and for the purpose specified.

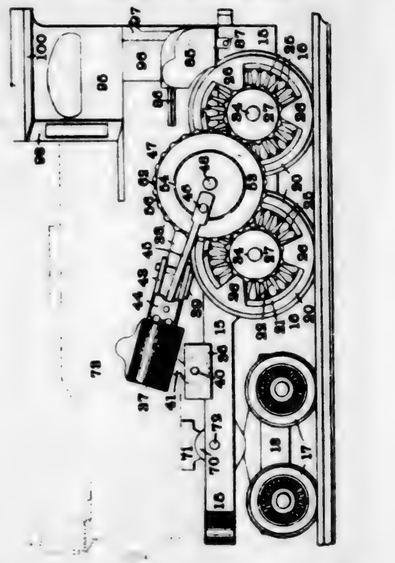
2. A feeding device of the class described comprising a valve-casing having separate interior oil-supply and vacuum chambers, the oil-supply chamber having an inlet-port, and the vacuum-chamber having an oil-delivery port, and also having an end opening and a guard-flange, a longitudinally-movable valve-stem carrying a feed-valve controlling communication between the two chambers, a valve-actuating piston fitted upon the stem and working within the vacuum-chamber, a supporting-bracket carried by the valve-casing at one end, a spring having a connection with said bracket and also with the valve-stem, a guide for the front end of said stem, and an adjusting device for limiting the movement of the stem carried by said guide.

709,429. LOCOMOTIVE. JOSEPH H. WILLIAMS, Upper Alton, Ill., assignor of three-fourths to Isaac Moore, H. B. Lindley, and H. L. Dickinson, Alton, Ill. Filed Jan. 9, 1902. Serial No. 89,013. (No model.)

Claim.—1. In a locomotive, the combination with a frame, of drive-wheels therefor, gear-wheels carried by said drive-wheels, disk-wheels for driving said gear-wheels, means for moving said disk-wheels into and out of engagement with said gear-wheels, and cylinders for driving said disk-wheels.

2. In a locomotive, the combination with a frame, of drive-wheels therefor, toothed gear-wheels carried by said drive-wheels, toothed disk-wheels for driving said gear-wheels, the teeth of one of said toothed wheels being yieldingly mounted, and cylinders for driving said disk-wheels.

3. In a locomotive, the combination with a frame, of drive-wheels therefor, toothed gear-wheels carried by said drive-wheels, toothed disk-wheels for driving said gear-wheels, the teeth of one of said toothed wheels being rotary, and cylinders for driving said disk-wheels.



4. In a locomotive, the combination with a frame, of drive-wheels therefor, a set of toothed gear-wheels carried by said drive-wheels, a set of toothed disk-wheels engaging with said gear-wheels, the teeth of one of said sets of wheels being in the form of rollers and that of the other set being yieldingly mounted, and cylinders for driving said disk-wheels.

5. In a locomotive, the combination with a frame, of drive-wheels therefor, gear-wheels carried by said drive-wheels and provided with yielding teeth, disk-wheels for driving said gear-wheels and provided with rotary teeth, and cylinders for driving said disk-wheels.

6. In a locomotive, the combination with a frame, of drive-wheels therefor, gear-wheels carried by said drive-wheels, each of said gear-wheels being provided with a circumferential row of teeth and a smooth circumferential bearing-strip, disk-wheels, each of said disk-wheels being provided with a circumferential row of teeth for engaging with the teeth of said gear-wheels and a smooth circumferential bearing-strip for engaging with the bearing-strips on said gear-wheels, and cylinders for driving said disk-wheels.

7. In a locomotive, the combination with a main frame, of drive-wheels therefor, gear-wheels carried by said drive-wheels, toothed disk-wheels connected with said gear-wheels, and a second frame movably mounted on said main frame and carrying said disk-wheels and cylinders for driving said disk-wheels.

8. In a locomotive, the combination with a main frame, of drive-wheels therefor, gear-wheels carried by said drive-wheels, a second frame pivotally mounted on said main frame, toothed disk-wheels carried by said second frame and connected with said gear-wheels, and cylinders for driving said disk-wheels.

9. In a locomotive, the combination with a main frame, of drive-wheels therefor, gear-wheels carried by said drive-wheels, a second frame movably mounted on said main frame, disk-wheels carried by said second frame, and reducing-gear adapted to be interposed between said gear-wheels and disk-wheels.

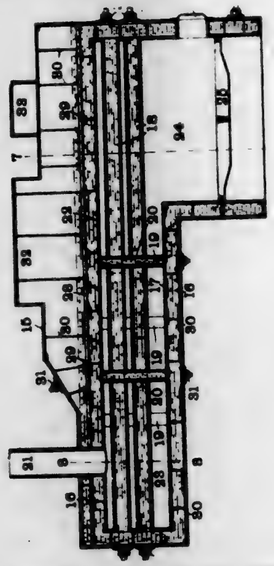
10. In a locomotive, the combination with a main frame, of drive-wheels therefor, gear-wheels carried by said drive-wheels, a second frame pivoted at one end to said main frame and at the other slidingly mounted in guides carried by said main frame, disk-wheels carried by said second frame and connected with said gear-wheels, cylinders carried by said second frame for driving said disk-wheels, and means for moving said second frame in said guides to disconnect said disk-wheels from said gear-wheels.

11. In a locomotive, the combination with a main frame, of drive-wheels therefor, gear-wheels carried by said drive-wheels, a second frame pivotally mounted on said main frame, disk-wheels carried by said second frame and connected with said gear-wheels, and a boiler pivotally mounted on said main frame.

12. In a locomotive, the combination with a main frame, of drive-wheels therefor, gear-wheels carried by said drive-wheels, a second frame pivotally mounted on said main frame, disk-wheels carried by said second frame and engaging with said gear-wheels, a boiler pivotally mounted on said main frame, means for raising said boiler on its pivot, and a stop adapted to be interposed between said main frame and boiler to hold the latter in its raised position.

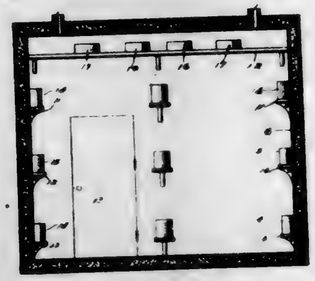
13. In a wheel for locomotives or the like, the combination with a rim, a hub, spokes extending between said rim and hub, radial plates carried by said rim at one side of said spokes, and a gear-wheel secured to said radial plates.

709,430. **LOCOMOTIVE-BOILER.** JOSEPH H. WILLIAMS, Upper Alton, Ill., assignor of three-fourths to Isaac Moore, M. R. Lindley, and H. L. Dickinson, Alton, Ill. Filed Feb. 24, 1902. Serial No. 95,235. (No model.)



Claim.—A boiler for locomotives and the like, consisting of an inner shell, an outer shell, horizontal water-tubes passing through said inner shell, and vertical water-tubes passing through said inner shell and through said horizontal tubes.

709,431. **PROCESS OF PRESERVING FOOD PRODUCTS.** WILLARD D. BAKER, Rogers, Ark., assignor to E. B. Harrington, trustee, Kansas City, Mo. Filed Apr. 16, 1901. Serial No. 56,106. (No specimens.)



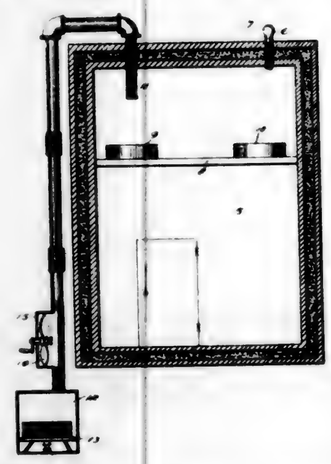
Claim.—1. The process of preserving food products, which consists in confining them in a chamber, and subjecting the air of the chamber to the action of an iron-sulfur mixture in the presence of an absorbent for gases.

2. The process of preserving food products, which consists in confining them in a chambe:, and subjecting the air in the chamber to the action of an aqueous mixture of sulfur and iron, and to that of charcoal.

3. The process of preserving food products, which consists in confining them in a chamber, and subjecting the air in the chamber to the action of an iron-sulfur mixture and to that of charcoal, and of a hygroscopic agent.

4. The process of preserving food products which consists in confining them in a chamber, and subjecting the air of the chamber to the action of an aqueous mixture of sulfur and iron, a dry mixture of iron, sulfur and potassium carbonate, and to an absorbent of gases and to a hygroscopic agent.

709,432. **PROCESS OF PRESERVING FOOD PRODUCTS.** WILLARD D. BAKER, Rogers, Ark., assignor to E. B. Harrington, trustee, Kansas City, Mo. Filed Apr. 16, 1901. Serial No. 56,107. (No specimens.)



Claim.—1. The process of preserving food products which consists in subjecting them to the products of combustion of paper impregnated with potassium nitrate.

2. The process of preserving food products which consists in subjecting them to the products of combustion of paper impregnated with potassium nitrate, in the presence of an absorbent for gases and an absorbent for moisture.

3. The process of preserving food products which consists in confining them in a chamber charged with the fumes of burning paper having potassium nitrate associated therewith, in the presence of potassium carbonate to absorb the moisture of the atmosphere of the chamber, and of charcoal to take up ill-smelling gases.

4. The process of preserving food products which consists in confining them in an atmosphere charged with carbonic-acid gas, a percentage of the principles of creosote and of fresh oxygen, produced by the combustion of paper impregnated with potassium nitrate, in the presence of an absorbent for moisture.

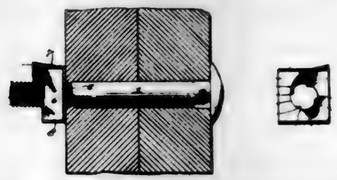
5. The process of preserving food products which consists in confining them in an atmosphere charged with carbonic-acid gas, nitrogen, a percentage of the principles of creosote and of fresh oxygen produced by the combustion of paper impregnated with potassium nitrate.

6. The process of preserving food products which consists in confining them in an atmosphere charged with the fumes of burning paper having potassium nitrate associated therewith, in the presence of potassium carbonate to absorb the moisture from the atmosphere.

7. The process of preserving food products which consists in confining them in an atmosphere charged with carbonic-acid gas, nitrogen, and a percentage of the principles of creosote, produced by the combustion of paper impregnated with potassium nitrate, in the presence of an absorbent for ill-smelling gases.

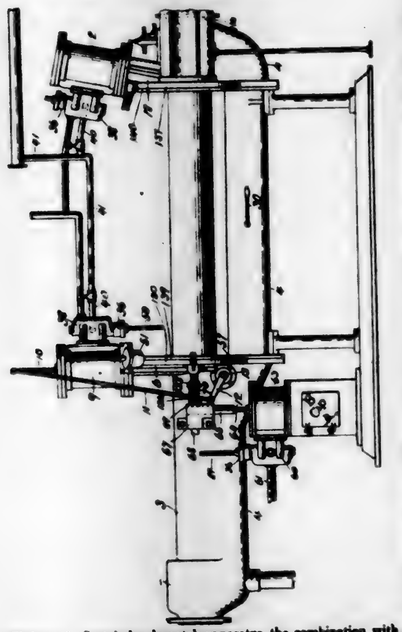
8. The process of preserving food products which consists in confining them in an atmosphere charged with carbonic-acid gas, nitrogen, a percentage of the principles of creosote and a percentage of fresh oxygen, produced by the combustion of paper impregnated with potassium nitrate, in the presence of an absorbent for moisture and an absorbent for ill-smelling gases.

709,433. **NUT-LOCK.** SAMUEL C. BAUGHN, Jr., Comer, Ky., assignor to T. W. Cooper, Beechgrove, Ky. Filed Feb. 28, 1901. Renewed Feb. 13, 1902. Serial No. 93,944. (No model.)



Claim.—The combination with a bolt having a screw-threaded extremity formed with a series of longitudinally-extending grooves, and a nut to removably engage said extremity, of a washer removably applied to the nut and bolt and having oppositely-disposed right-angular flanges to rest against opposite side edges of the nut, one flange being wider than the other and cut free longitudinally for a greater portion of its length to form a depending resilient pawl which is regularly curved downwardly and loosely projects over the outer face of the nut to have its free end enter either one of the grooves in the bolt, the flange carrying the pawl at the point of juncture of the latter therewith at one end being flared outwardly from and fully out of contact with the adjacent portion of the edge of the nut and at an inclination to the adjacent portion of the flange, said flared portion of the flange and pawl being located to one side of the center of the nut and also inclining in a transverse direction inwardly toward the inner side of the nut and main body of the washer, whereby a compression of the inclined portions of the flange and pawl toward the nut edge will positively disengage the free end of the pawl from the bolt-groove.

709,434. **TUBULAR DESPATCH APPARATUS.** WASHINGTON A. H. BOGARDUS, LLOYD COLLIE, and GEORGE O. POWELL, New York, N. Y. Filed Nov. 29, 1901. Serial No. 84,014. (No model.)



Claim.—1. In tubular despatch apparatus, the combination with a tube, of a chambered revolvable shifting member cooperating through its chambers at both ends with said tube to form a continuous alined passage-way, movable abutments in said tube adjacent the ends of said member, operating means for said member and said abutments and a controller for said operating means carried by one of said abutments and operable from within the chambers of said member.

2. In tubular despatch apparatus, the combination with an incoming tube and an outgoing tube, of a chambered revolvable shifting member coöperating with said tubes through any one of its chambers to form a continuous alined passage-way and a gate in said outgoing tube adjacent said member.

3. In tubular despatch apparatus, the combination with an incoming tube and an outgoing tube, of a chambered revolvable shifting member coöperating with said tubes through any one of its chambers to form a continuous alined passage-way and a gate in said incoming tube adjacent said member.

4. In tubular despatch apparatus, the combination with an incoming tube and an outgoing tube, of a chambered revolvable shifting member coöperating with said tubes through any one of its chambers to form a continuous alined passage-way and gates in said incoming and outgoing tubes adjacent said member.

5. In tubular despatch apparatus, the combination with an incoming tube and an outgoing tube, of a chambered revolvable shifting member coöperating with said tubes through any one of its chambers to form a continuous alined passage-way and means for obstructing said passage-way adjacent either end of said member independently of the revolution of said member.

6. In tubular despatch apparatus, the combination with an incoming tube and an outgoing tube, of a chambered revolvable shifting member coöperating through any one of its chambers with said tubes to form a continuous alined passage-way and a normally closed gate in said outgoing tube adjacent said member.

7. In tubular despatch apparatus, the combination with an incoming tube and an outgoing tube, of a chambered revolvable shifting member coöperating through any one of its chambers with the said tubes to form a continuous alined passage-way and means normally obstructing the outgoing tube adjacent said member.

8. In tubular despatch apparatus, the combination with a main receiving-chamber, an entrance-gate for said main chamber, of an auxiliary cushioning-chamber forward of said main chamber and a valve actuated by said entrance-gate to render said auxiliary cushioning-chamber operative when said gate is closed and inoperative when said gate is open.

9. In tubular despatch apparatus, the combination with a main receiving-chamber and an entrance-gate for said main chamber, of an auxiliary cushioning-chamber forward of said main chamber, a rotary valve communicating with the rearward end of said auxiliary cushioning-chamber, an operating-crank for said valve, and a link connection between said gate and valve designed to cause said valve and gate to open and close simultaneously.

10. In tubular despatch apparatus, the combination with a tube, of a gate in said tube, operating mechanism for said gate, and controlling mechanism carried by said gate designed to control said operating mechanism.

11. In tubular despatch apparatus, the combination with a tube, of a gate in said tube, operating mechanism for said gate, controlling mechanism for said operating mechanism carried by said gate and flexible connections between said controlling and operating mechanisms.

12. In tubular despatch apparatus, the combination with a tube, of a chambered revolvable shifting member intersecting said tube, revolving mechanism for said member, a gate in said tube adjacent the rearward end of said member, operating mechanism for said gate, and controlling members for said revolving and gate-operating mechanisms carried by said gate.

13. In tubular despatch apparatus, the combination with a tube, of a chambered revolvable shifting member, revolving means for said shifting member, an exit-gate in said tube adjacent the rearward end of said shifting member, operating mechanism for said exit-gate, an entrance-gate in said tube adjacent the forward end of said shifting member, operating mechanism for said entrance-gate, an auxiliary cushioning-chamber forward of said entrance-gate, operating mechanism for said auxiliary cushioning-chamber, a controlling member mounted in said exit-gate controlling said revolving, entrance-gate and auxiliary cushioning-chamber operating mechanisms, and a controlling member mounted in said exit-gate controlling said exit-gate-operating mechanism.

14. In tubular transit apparatus, the combination with a tube, of a chambered revolvable shifting member intersecting said tube, a locking-bolt for said shifting member, revolving mechanism for said shifting member, a gate in said tube forward of and adjacent said shifting member, and means actuated by said bolt simultaneously controlling said revolving mechanism and said gate.

15. In tubular transit apparatus, the combination with a tube, of a chambered revolvable shifting member, revolving mechanism for said shifting member, a gate in said tube forward of and adjacent said shifting member, an exit-gate, a controlling member mounted in said exit-gate controlling said revolving mechanism and said entrance-gate and a hand-controller for said revolving mechanism and said entrance-gate.

16. In tubular transit apparatus, the combination with a tube, of a chambered revolubie shifting member, revolving means for said shifting member, an exit-gate, operating mechanism for said exit-gate, a controlling member mounted in said exit-gate normally controlling said exit-gate-operating mechanism and a time-lock valve mechanism designed to transfer the control of the controlling member from the exit-gate-operating mechanism to the said revolving means.

17. In tubular despatch apparatus, the combination with an incoming tube, of a revolubie chambered shifting member, a gate in said incoming tube, operating mechanism for said gate, a locking-bolt for said shifting member and a valve actuated by said locking-bolt designed to control said operating mechanism.

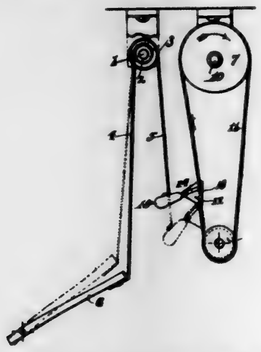
18. In tubular despatch apparatus, the combination with an incoming tube, of a chambered revolubie shifting member, revolving means for said shifting member, a gate in said incoming tube, operating mechanism for said gate, a locking-bolt for said shifting member, and a valve actuated by said locking-bolt designed to control said revolving and operating mechanisms.

19. In tubular despatch apparatus, the combination with a tube, of a chambered revolubie shifting member, revolving means for said shifting member, a gate in said tube forward of and adjacent said shifting member, a gate in said tube adjacent the rear end of said shifting member, operating mechanisms for said gates, a locking-bolt for said shifting member and a valve actuated by said locking-bolt designed to control said revolving and operating mechanisms.

20. In tubular despatch apparatus, the combination with a tube, of a revoluble shifting member, a gate in said tube rearwardly of and adjacent said shifting member, a locking-bolt for said shifting member, operating mechanism for said locking-bolt, and a controlling member carried by said gate designed to control said operating mechanism.

21. In tubular despatch apparatus, the combination with a trip-finger and a time-lock valve, of a locking-pin designed to prevent the movement of said trip-finger, and operating mechanism for said locking-pin controlled by said time-lock valve.

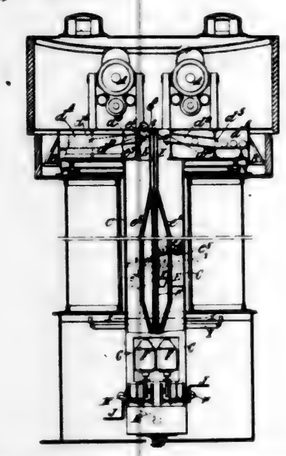
709,485. **FOOT-POWER DEVICE.** GEORGE P. CLARK and GEORGE H. DAVIS, New York, N. Y. Filed Apr. 2, 1900. Serial No. 11,111. (No model.)



Claim.—1. In a device for transmitting motion the combination with a strap or belt, of a clutching member arranged to act upon one side thereof, a second clutching member pivotally connected to the first-named member and having a gripping edge arranged to act upon the opposite side of the strap or belt, means normally acting upon the pivoted gripping member to throw the gripping edge thereof out of contact with the strap or belt and to move the clutch idly over the belt, and means for lifting the outer end of the pivoted gripping member to cause its gripping edge to grip the strap or belt and impart a lifting action thereto to advance the same.

2. In a device for transmitting motion, the combination with a belt to be driven, of a treadle having a strap secured thereto at one end, a loose pulley to which the other end of said strap is secured, a second strap secured to said loose pulley, and a clutch device secured to said second strap, said clutch device comprising a member disposed on one side of the belt, a clutching member pivotally connected to the first-named member and having a gripping edge arranged to act upon the belt opposite said first-named member, and means normally acting upon said pivoted member to throw the gripping edge thereof out of contact with the belt and to move the clutch idly over the belt, substantially as described.

709,486. **AMMUNITION-HOIST FOR ORDNANCE.** ARTHUR T. DAWSON, Westminster, London, and JAMES HORNE, Barrow-in-Furness, England, assignors to Vickers Sons & Maxim, Limited, London, England. Original application filed Aug. 19, 1901, Serial No. 72,639. Divided and this application filed Jan. 10, 1902. Serial No. 89,247. (No model.)



Claim.—1. In ammunition-hoists for ordnance, the combination with the gun-mounting and the trunk leading from the magazine to the mounting, of a pair of ammunition cages or carriers for each gun, of rails within the trunk for said cages to travel along, of means whereby each cage carries both the projectile and the powder charge, of means for supplying the projectile and powder charge to the cage and of means for automatically and simultaneously releasing said projectile and powder charge from the cage when it reaches its uppermost position so that the projectile is discharged from the cage longitudinally and the powder charge is discharged transversely, substantially as described.

2. In ammunition-hoists for ordnance, the combination with a cage or carrier provided with an upper inclined surface to receive the projectile, of a swinging tray for receiving the powder charge or charges, of a spring-bolt for normally retaining the projectile in place on the cage, of an arm on said swinging tray, of means for actuating said spring-bolt and said arm for liberating the projectile and powder charge when the cage reaches its uppermost position, of inclined chutes into which the powder charges enter transversely by the tilting movement of the swinging tray and of inclined troughs into which the projectiles slide longitudinally when released from the cage substantially as and for the purpose described.

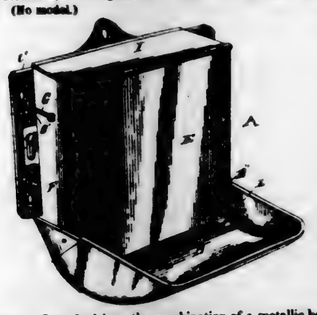
3. In ammunition-hoists for ordnance, the combination with the gun-mounting and the trunk leading from the magazine to the mounting, of a pair of ammunition cages or carriers for each gun, of rails within the trunk for said cages to travel along, said rails affording a separate path for the cages during their upward and downward travel, of power hoisting apparatus for actuating said cages, of a hand-winch for enabling the cages to be actuated in the event of the power hoisting apparatus becoming inoperative, of trays near the bottom of the trunk for supplying the projectiles and powder charges to the cages, of inclined chutes near the top of the trunk for receiving and conveying the powder charges to trays provided for their reception, and of inclined troughs near the top of the trunk for receiving the projectiles and conveying them to the rear of the guns and level with the gun-platform, substantially as and for the purpose described.

709,487. **APPARATUS FOR COMPOSITE SYSTEMS OF SIMULTANEOUS TELEGRAPHY AND TELEPHONY.** JOHN M. FELL, Arlington, N. J., assignor to American Telephone and Telegraph Company, a Corporation of New York. Original application filed Sept. 16, 1901, Serial No. 75,491. Divided and this application filed Jan. 8, 1902. Serial No. 88,853. (No model.)

Claim.—1. In a system of composite and simultaneous telegraphy and telephony, the combination of a metallic or double-conductor telephone-circuit; two independent earth-return telegraphic circuits having for their line conductors the two main conductors respectively of the said metallic circuit; and impedance devices or electromagnetic resistances interposed between the instruments of the said telephone-circuit, and the two telegraphic circuits respectively; with call-signal apparatus connected with the telephonic circuit comprising a generating and transmitting device at one telephone-station adapted to develop and transmit alternating call-currents of such potential and frequency as to be obstructed by the said impedance devices; and a signal-receiving relay at another telephone-station responsive only to said alternating call-currents of appropriate frequency.

2. In a system of composite and simultaneous telegraphy and telephony, the combination of a metallic or double-conductor telephone-circuit; two independent earth-return telegraphic circuits having for their line conductors the two main conductors respectively of the said metallic circuit; and impedance devices or electromagnetic resistances interposed between the instruments of the said telephone-circuit, and the two telegraphic circuits respectively; with call-signal apparatus connected with the said telephonic circuit at the stations thereof, and comprising a generating and transmitting device at each telephone-station adapted to develop and transmit alternating call-currents of such potential and frequency as to be obstructed by the said impedance devices; and a signal-receiving relay at each station responsive only to said alternating call-currents of appropriate frequency, substantially as set forth.

709,488. **FEED-BOX FOR LIVE STOCK.** GEORGE M. FILLMORE, Washington, D. C., assignor, by direct and mesne assignments, of two-thirds to Jackson H. Ralston, Hyattsville, Md., and M. H. Ramage and Albert Schultein, Washington, D. C. Filed Jan. 17, 1902. Serial No. 90,109. (No model.)



Claim.—1. In a feed-box, the combination of a metallic bowl having an inclined rear side, extending upward as a vertical back plate and provided with suspending devices, and a section forming a hopper front and sides, and adjustably and removably connected to the flat vertical back plate so as to form a receptacle between said hopper-section and the extended back of the bowl, substantially as described.

2. In a feed-box, the combination of a bowl having an upward extension at one side, an adjustable and removable hopper-section having front and ends, and means for securing the hopper-section in adjusted relation to the bowl, so that the opening under the hopper into the bowl may be of the desired capacity.

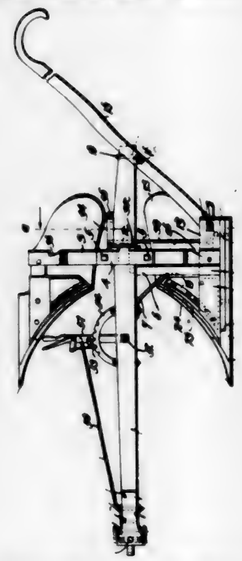
3. The combination with the bowl having an extended back plate, of the hopper-section removably secured thereto, and means for adjusting and securing the hopper-section vertically on said back plate.

4. The combination of the metallic bowl having upwardly-extended back plate, of the hopper-section having front and side flanges and slotted attaching-lugs, and set-screws extending through the slots in said lugs into the back plate.

5. The combination of a metallic bowl having a widened rear portion and a back plate, of a removable hopper-section fitting into the widened rear portion of the bowl, and attaching devices by which the hopper-section is attached to the back plate.

6. In a feed-box, the combination of a cast-metal bowl having an extension back piece provided with suspending devices and a sheet-metal hopper-section having a front and sides, and slotted outturned lugs which rest against said back, said hopper and back being secured in adjusted relation, substantially as described.

709,489. **REVERSIBLE PLOW.** JOHN W. GLENDY, Dublin, Va. Filed Apr. 4, 1902. Serial No. 101,394. (No model.)



Claim.—1. In a reversible plow, the combination of a beam having a fixed standard and a footpiece at the lower end of said standard, a reversible standard pivotally mounted on said beam and shares carried by said reversible standard, said shares being adapted to bear successively on the footpiece and having stops to aline their landside-faces with the sides of the fixed standard, substantially as described.

2. In a reversible plow, the combination of a beam having a fixed standard and a footpiece at the lower end of and extending forwardly from said standard, a reversible standard pivotally mounted on said beam and shares carried by said reversible standard, said shares being adapted to bear successively on the footpiece, and said shares, fixed standard and reversible standard having sectional landsides adapted to aline with each other when one of the shares is in operative position on the footpiece, substantially as described.

3. In a reversible plow, the combination of a beam, having a fixed standard and a footpiece at the lower end of and extending forwardly and rearwardly from said standard, a reversible standard pivotally mounted on said beam, and shares carried by said reversible standard, said shares being adapted to bear successively on the footpiece and said shares, fixed standard, reversible standard and footpiece having sectional landsides adapted to aline with each other when one of the shares is in operative position on the footpiece, substantially as described.

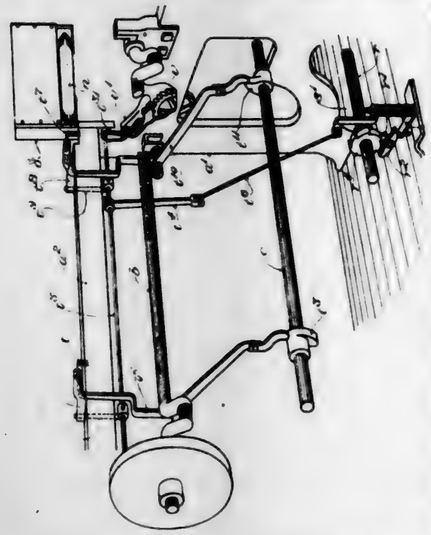
4. In a reversible plow, the combination of a beam, having a fixed standard and a footpiece at the lower end of said standard, a reversible standard pivotally connected to the beam, and shares carried at the ends of said reversible standard and adapted to be successively disposed on the footpiece, each of said shares having a frame to which its moldboard and point are secured and a bridge-bar on the inner side of said frame connecting the latter to the reversible standard whereby clearance-spaces are formed between the said frames and the reversible standard 4, the reversible standard and said bridge-bars serving to arrest the rotation of the reversible standard by engaging one side of the fixed standard when one of the shares is disposed in operative position, substantially as described.

5. In a reversible plow, the combination of a beam having a fixed standard and a footpiece at the lower end of said fixed standard, a housing on said footpiece in rear of said fixed standard and spaced therefrom, the sides of said housing being coincident with those of the footpiece and fixed standard and together with the sides of the fixed standard forming sections of the landsides, a reversible standard pivotally connected to the beam, shares carried by the respective ends of said reversible standard and adapted to be successively disposed on the footpiece, said shares having landside-pieces adapted to register with the aforementioned sectional landsides, and a detent disposed in the housing and adapted to engage the reversible standard, for the purposes set forth, substantially as described.

6. In a reversible plow, the combination of a beam having a fixed standard and a footpiece at the lower end of said fixed standard, a reversible standard having its bearing on said beam and provided at its intermediate portion on its rear side with oppositely-disposed stop-notches, a pivoted detent on the beam adapted to successively engage said stop-notches, a detent pivotally disposed on the footpiece and adapted to engage and lock the lower end of the reversible standard, and a connection between said detents to cause the same to operate simultaneously, substantially as described.

7. In a reversible plow, a beam having a fixed standard, a footpiece at the lower end of the fixed standard and extending forwardly and rearwardly therefrom, and handles connected to the rear end of footpiece and to the beam, in combination with a reversible standard carrying shares at its opposite ends, and means to secure said reversible standard in position to dispose either of the shares for operation, substantially as described.

709,440. **WEFT-REPLENISHING LOOM.** HENRY I. HARRIMAN, New York, N. Y. Filed Apr. 14, 1902. Serial No. 103,510. (No model.)



Claim.—1. In a weft-replenishing loom, in combination, weft-replenishing instrumentalities arranged to effect the replenishment of the working weft-supply, a take-up, weft-forks at opposite ends of the loom, a rod, as f^2, extending across the loom and having in connection therewith means operated thereby to arrest the taking up and occasion the action of the weft-replenishing instrumentalities, and means operatively connecting said rod with both of said weft-forks whereby said rod is operated when either weft-fork detects the absence of weft or filling.

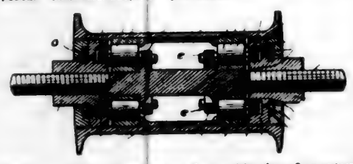
2. In a weft-replenishing loom, in combination, the change-shaft, clutch devices for driving the same, a controller for the said clutch devices, weft-detectors at opposite ends of the loom in operative control of said controller, and thin-place-preventing devices under operative control of both of the said weft-detectors and actuated to arrest the taking up of the cloth when either weft-detector detects the absence of weft or filling.

3. In a weft-replenishing loom, in combination, weft-replenishing instrumentalities, a controller, as *s*, in connection therewith, a take-up, weft-forks at opposite ends of the loom, a rod, as f^2, extending across the loom and having in connection therewith means operated thereby to arrest the taking up, said rod also having operative connection with said controller, and means operatively connecting said rod with both of said weft-forks, whereby said rod is operated when either weft-fork detects the absence of weft.

4. In a weft-replenishing loom, in combination, the change-shaft, the toothed wheel and dog or pawl for driving the change-shaft, the controller in connection therewith, weft-detectors at opposite ends of said loom in operative control of said controller, a take-up, and thin-place-preventing devices under operative control of both of the said weft-detectors and actuated to arrest the taking up of the cloth when either weft-detector detects the absence of weft or filling.

5. In a weft-replenishing loom, in combination, the change-shaft, the toothed wheel and dog, a controller, a take-up, weft-detectors at opposite ends of said loom, a rod, as f^2, extending across the loom and having in connection therewith a thin-place-preventing device, said rod also having operative connection with said controller and both of said weft-works, whereby said rod is operated when either weft-fork detects the absence of weft.

709,441. **ROLLER-BEARING.** ALBERT E. HENDERSON, Toronto, Canada, assignor to The Toronto Roller Bearing Company, Limited, Toronto, Canada, a Corporation of Ontario. Original application filed July 30, 1901, Serial No. 69,151. Divided and this application filed June 5, 1902. Serial No. 110,334. (No model.)



Claim.—1. In a roller-bearing, the combination of an external hub-shell having internal annular flanges, an axle having integral peripheral flanges alining substantially with the annular flanges of the hub-shell, bearing-rings having conical recesses terminating in horizontally-disposed bores, tie-rods having abutting shoulders engaging the inner faces and nuts engaging the outer faces of the bearing-rings, bearing-rollers having tapering mandrels terminating in abruptly-conical ends journaled in the conical recesses, antifriction-sleeves contained within the hub-shell encircling and contacting the bearing-rollers, and antifriction-sleeves mounted on the axle encircled by and contacting the rollers.

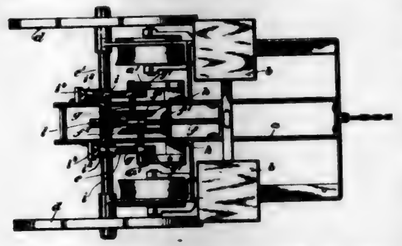
2. The combination of the hub-shell having internal annular flanges, an axle having integral peripheral flanges alining substantially with the annular flanges of the hub-shell, bearing-rings having conical recesses terminating in horizontally-disposed bores, tie-rods having abutting shoulders engaging the inner faces and nuts engaging the outer faces of the bearing-rings, bearing-rollers having tapering mandrels terminating in abruptly-conical ends journaled in the conical recesses, and antifriction bearing-surfaces for the rollers.

3. The combination of the hub-shell having internal annular flanges, an axle having integral peripheral flanges alining substantially with the annular flange of the hub-shell, bearing-rings having conical recesses terminating in horizontally-disposed bores, tie-rods for uniting the bearing-rings, bearing-rollers having recessed ends fitted with tapering mandrels terminating in abruptly-conical ends journaled in the conical recesses, antifriction-sleeves contained within the hub-shell encircling and contacting the antifriction bearing-rollers, and nuts fitted on the axle and into the ends of the hub-shell having on their inner faces annular flanges contacting with the ends of the bearing-rollers.

4. The combination of a hub-shell having internal annular flanges, an axle having integral peripheral flanges alining substantially with the flanges of the hub-shell, bearing-rings having conical recesses terminating in horizontally-disposed bores, tie-rods having abutting shoulders engaging the inner faces and nuts engaging the outer faces of the bearing-rings, bearing-rollers having recessed ends fitted with tapering mandrels terminating in abruptly-conical ends journaled in the conical recesses, antifriction-sleeves contained within the hub-shell encircling and contacting the bearing-rollers, antifriction-sleeves mounted on the axle encircled by and contacting the bearing-rollers, and nuts fitted on the axle and into the ends of the hub-shell having on their inner faces annular flanges contacting the ends of the bearing-rollers.

5. The combination of the hub-shell having internal annular flanges, an axle having integral peripheral flanges alining substantially with the flanges of the hub-shell, bearing-rings having conical recesses terminating in horizontally-disposed bores, tie-rods uniting the bearing-rings, bearing-rollers having recessed ends fitted with tapering mandrels terminating in abruptly-conical ends journaled in the conical recesses, antifriction-sleeves contained within the hub-shell encircling and contacting the bearing-rollers, antifriction-sleeves mounted on the axle and encircled by and contacting the bearing-rollers, and nuts fitted on the axle and into the ends of the hub-shell having on their inner faces annular flanges contacting with the ends of the bearing-rollers.

709,442. **SEED-PLANTER.** JAMES M. HIGBE, Manson, Iowa. Filed Jan. 2, 1902. Serial No. 88,063. (No model.)



Claim.—1. A seed-planter, comprising a dropping mechanism, an axle in two sections, a traction-wheel connected to each section of the axle, and two trains of gears running respectively from the sections of the axle to the dropping mechanism, said trains of gears being operated simultaneously or independently to uniformly actuate the dropping mechanism.

2. A seed-planter, comprising dropping mechanism, a driving member, and two trains of gears from the driving member to the dropping mechanism, said trains of gears being operative independently or simultaneously to uniformly actuate the dropping mechanism.

3. A seed-planter, comprising dropping mechanism, a driving-axle, two trains of gears for driving the dropping mechanism from the axle, each of said trains comprising friction-wheels mounted on fixed axes, and an additional friction-wheel mounted to move toward and from the first friction-wheel to connect or disconnect the same.

4. A seed-planter, comprising dropping mechanism, a driving-axle, two trains of gears for driving the dropping mechanism from the axle, each of said trains comprising friction-wheels mounted on fixed axes, an additional friction-wheel mounted to move toward and from the first friction-wheel to connect or disconnect the same, said friction-wheels being carried in independently-movable hangers, and brackets for sustaining the hangers.

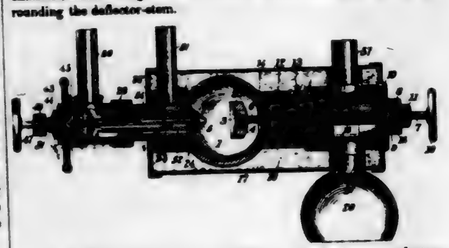
5. A seed-planter, comprising a frame, a dropping mechanism, a longitudinal shaft in connection therewith, pinions fastened to the shaft, counter-shafts, gears carried by the counter-shafts and respectively meshed with the pinions, an axle, and friction-gears connecting the axle with the counter-shafts, said friction-gears comprising shiftable elements for throwing the sets of gears into and out of action.

6. In a seed-planter, the combination of dropping mechanism, a driving member, two independently-operative groups of movement-transmitting means driven by the driving member, and a means (such as the shaft *f*) for connecting said groups of movement-transmitting means with the dropping mechanism.

709,443. **HYDROCARBON-BURNER.** MARY A. HODGE, San Jose, Cal., administratrix of Washington H. Stewart, deceased, assignor of three-fourths to Willis P. Holmes and Leonard M. Hodge, San Jose, Cal. Filed Nov. 20, 1901. Serial No. 83,004. (No model.)

Claim.—1. A hydrocarbon-burner comprising consecutively-arranged atomizing and vaporizing chambers, an oil-supply communicating with the atomizing-chamber, an oil-deflector in the atomizing-chamber, a deflector-supporting stem extending within the vaporizing-chamber, and a mass of meshed fabric surrounding the deflector-stem.

2. A hydrocarbon-burner comprising a spheroidal atomizing-chamber, a vaporizing-chamber, a concavo-convex oil-deflector in the atomizing-chamber, a deflector-supporting stem extending into the vaporizing-chamber, and a wire-gauze maze within the vaporizing-chamber and surrounding the deflector-stem.



3. A hydrocarbon-burner comprising consecutively-arranged atomizing and vaporizing chambers, a deflector arranged in the atomizing-chamber, a deflector-supporting stem passing through the vaporizing-chamber, and a mass surrounding the deflector-stem within the vaporizing-chamber, the deflector being adapted to intercept the oil on its way toward the mass.

4. A hydrocarbon-burner comprising an atomizing-chamber, a vaporizing-chamber at one side of the atomizing-chamber, steam and oil supply pipes and controlling-valves therefor located at the opposite side of the atomizing-chamber, and an adjustable imperforate deflector located within the atomizing-chamber.

5. A hydrocarbon-burner comprising a mixing and atomizing chamber, a vaporizing-chamber arranged at one side of the atomizing-chamber, oil and steam supply pipes arranged at the opposite side of the atomizing-chamber, and a reversible deflector or deflecting-block located within the atomizing-chamber.

6. A hydrocarbon-burner comprising a mixing and atomizing chamber, a vaporizing-chamber arranged at one side of the atomizing-chamber, oil and steam supply pipes and controlling-valves therefor arranged at the opposite side of the atomizing-chamber, and an adjustable and reversible concavo-convex deflector located within the atomizing-chamber.

7. A hydrocarbon-burner comprising a vaporizing-chamber, an oil-supply leading toward the same, a spheroidal atomizing-chamber interposed between the oil-supply and vaporizing-chamber, and a normally stationary disk-shaped deflector arranged centrally within the atomizing chamber and adapted to intercept and spread the oil on its way toward the vaporizing-chamber.

8. A hydrocarbon-burner comprising consecutively-arranged atomizing and vaporizing chambers, a deflector adapted to intercept the oil while passing through the atomizing-chamber toward the vaporizing-chamber, a longitudinally-movable deflector-supporting stem extending through the vaporizing-chamber, and a mass composed of meshed fabric surrounding the deflector-stem and filling the vaporizing-chamber.

9. In a hydrocarbon-burner, consecutively-arranged atomizing and vaporizing chambers, a cap removably applied to one end of the vaporizing-chamber, a deflector arranged in the atomizing-chamber, a deflector-adjusting stem passing through the vaporizing-chamber and cap, and a mass encircling the deflector-stem within the vaporizing-chamber and removable together with the stem, deflector and cap.

10. In a hydrocarbon-burner, the combination with a vaporizing-chamber and means for introducing a mixture of steam and oil thereto, of a mass substantially filling said vaporizing-chamber, and an adjustable stop forming an abutment for one end of the mass.

11. In a hydrocarbon-burner, the combination with a mixing-chamber, of an oil-chamber terminating in a nozzle leading into the mixing-chamber, a tubular oil-supply valve mounted within the oil-chamber, and a rotary hand-wheel having a cam engagement with said oil-supply valve for adjusting the latter, substantially as described.

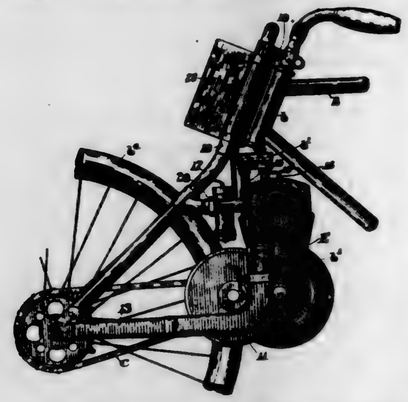
12. In a hydrocarbon-burner, the combination with a mixing-chamber, of an oil-chamber terminating in a nozzle leading into the mixing-chamber, a tubular oil-supply valve mounted within the oil-chamber, and a rotary hand-wheel provided with an oblique flange which cooperates with the oil-supply valve for adjusting said valve toward and away from its seat, substantially as described.

709,444. **ROLLER-BEARING FOR CARPET-SWEEPERS.** FRANCIS C. MASON, Grand Rapids, Mich., assignor to The Bissell Carpet Sweeper Company, Grand Rapids, Mich., a Corporation. Filed Oct. 30, 1901. Serial No. 80,554. (No model.)

Claim.—The combination of a casing having a driving-wheel, an axle carried by the casing and extending through the hub of said driving-wheel, and the hub extending outward beyond the rim of the wheel, a series of antifriction-rollers in the hub bearing against said axle, a guard

on the casing crossing the outer open end of the hub and adapted to directly engage the outer ends of said rollers to thereby prevent outward displacement of the same and to also hold the wheel on its axle, and independent means for preventing inward displacement of said rollers.

709,445. **ENGINE-SUPPORT.** ALBERT W. HEDEN, Revere, and ALBERTO T. VAN HORN, Malden, Mass., assignors to HEDEN-VAN HORN Motor Company, Portland, Me., and Boston, Mass., a Corporation of Maine. Filed Jan. 23, 1902. Serial No. 90,735. (No model.)



Claim.—1. The combination with a cycle, of engine mechanism supported wholly at the rear of the steering-wheel to swing therewith in its steering movement whereby the weight of said engine mechanism will exert a constant tendency to maintain the steering-wheel in a central position.

2. The combination with a cycle, of an engine supported at the rear of the steering-wheel beneath the fork-crown and connected therewith.

3. The combination with a cycle, of an engine supported between the forks of a single steering-wheel and at the rear of said wheel.

4. The combination with a cycle, of an engine supported between the forks of the steering-wheel to swing therewith in its steering movement and an arm secured to the engine and fork-crown.

5. The combination with a cycle having the forks of the steering-wheel so formed that a portion thereof will lie in a plane at the rear of the wheel, of an engine supported between the forks.

6. The combination with a cycle having the forks of the steering-wheel so formed that a portion thereof will lie in a plane at the rear of the wheel, of an engine supported between the forks, and arms connecting the engine and forks.

7. The combination with a cycle having forks extending downward in a substantially vertical direction from the crown and then forward in a substantially horizontal direction, of an engine mounted between the forks.

8. The combination with a cycle having forks comprising a substantially vertical member and a substantially horizontal member extending therefrom in opposite directions, of an engine supported at one end of the horizontal members.

9. The combination with a cycle having forks comprising a substantially vertical member and a substantially horizontal member extending therefrom in opposite directions, one of the ends of the horizontal members lying in proximity to the vertical members, of an engine supported by the horizontal members between the vertical members.

10. The combination with a cycle, of an engine supported between the forks of one of the wheels, and a stay extending from at or near the outer portion of the forks to a point upon the cycle above the forks.

11. The combination with a cycle, of an engine supported upon the forks of the steering-wheel to swing therewith in its steering movement, and a stay extending from at or near the outer portion of the forks to a point upon the cycle above the forks.

12. The combination with a cycle, of an engine supported upon the forks of the steering-wheel to swing therewith in its steering movement, and a stay connected with the outer portion of the forks and with an extension from the fork-crown.

13. The combination with a cycle, of an engine supported upon the forks of the steering-wheel to swing therewith in its steering movement, and a stay connected with the outer portion of the forks and with an extension from the handle-bar stem.

14. The combination with a cycle, of an engine supported upon the forks of the steering-wheel to swing therewith in its steering movement, and a stay connected with the outer portion of the forks and with an extension from the fork-crown and an extension from the handle-bar stem.

15. The combination with a cycle, of an engine supported upon the forks of the steering-wheel to swing therewith in its steering movement, a stay extending from at or near the outer portions of the forks to a point upon the cycle above the forks, and a fuel-tank mounted upon said stay.

16. The combination with a cycle, of an engine supported upon the forks of the steering-wheel to swing therewith in its steering movement, a hollow stay extending from the forks to a point above the forks, and means for delivering the engine-exhaust to the stay.

709,446. **MANUFACTURE OF CAR-WHEELS.** JOHN W. MOREAR, Jr., McKeesport, Pa. Filed Jan. 2, 1902. Serial No. 88,066. (No model.)

Claim.—1. In a car-wheel, the combination of a web and hub portion, projections of segmental form carried by said web portion and each provided at one of their edges with a semicircular internally-screw-threaded groove, a rim, inwardly-projecting lugs carried by said rim and each provided with a semicircular groove, said lugs extending across the lower face of the tire and adapted to fit between the projections of the rim, whereby the internally-screw-threaded grooves of each member will lie adjacent each other and form internally-screw-threaded sockets, and set-screws fitted in said sockets.

2. In a car-wheel, the combination of a web and hub portion, horizontally-disposed projections formed integral with and located adjacent the edge of the said web portion, a rim, inwardly-projecting lugs located on the inner surface of the rim, said lugs extending across the inner surface of the rim and adapted to fit between the horizontally-disposed projections of the web, whereby the rim's and web's projections will interlock, and keys fitted therebetween.

3. In a car-wheel, the combination of a web and hub portion, horizontally-arranged projections of segmental form spaced apart on one side of the web adjacent its periphery, said projections provided on one of their edges with a semicircular internally-screw-threaded groove, a rim, inwardly-projecting lugs spaced apart on its lower face and extending thereacross, said lugs provided on one of their edges with semicircular internally-screw-threaded grooves, said lugs adapted to fit between the web projections and interlock, whereby the internally-screw-threaded grooves of the web and tire will lie adjacent each other and form internally-screw-threaded sockets, and set-screws fitted in said sockets.

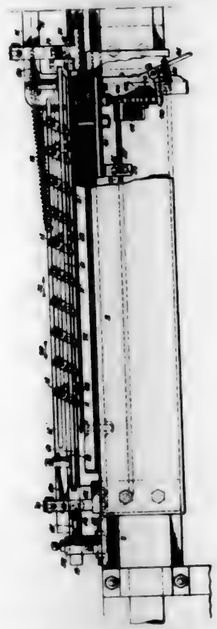
709,447. **LOOM FOR WEAVING PILE FABRICS.** ALFRED F. MCCOLLUM, Esqr., Pa., assignor of three-fifths to James Magee, 2d, Bloomsburg, Pa. Filed July 8, 1901. Serial No. 67,535. (No model.)

Claim.—1. In pile-cutting mechanism for looms, the combination of a knife-carrier mounted above the fabric, and a knife pivoted to said carrier and movable on its pivot so as to engage with or be disengaged from the pile-loops, substantially as specified.

2. In pile-cutting mechanism for looms, the combination of a knife-carrier mounted above the fabric and movable across the same, and a knife pivoted to said carrier and movable on its pivot so as to engage with or be disengaged from the pile-loops, substantially as specified.

3. In pile-cutting mechanism for looms, the combination of a knife-carrier mounted above and movable across the fabric, with a plurality of knives mounted upon said carrier, and each adapted to cut a portion of a row of pile-loops, whereby the movement of the knife-carrier is less than the width of the fabric, substantially as specified.

4. In pile-cutting mechanism for looms, the combination of a grooved pile-wire, a knife-carrier mounted above and movable across the fabric, and a plurality of knives mounted upon said carrier and having cutting portions movable into and out of the groove of the pile-wire, substantially as specified.



5. In pile-cutting mechanism for looms, the combination of a knife-carrier mounted above and movable across the fabric, with a plurality of knives mounted on said carrier, and movable into and out of engagement with the pile-loops, substantially as specified.

6. In pile-cutting mechanism for looms, the combination of a grooved pile-wire, a knife-carrier mounted above the fabric and a cutting-knife pivoted to said carrier so that its cutting portion may be swung into and out of the groove of the pile-wire, substantially as specified.

7. In pile-cutting mechanism for looms, the combination of a grooved pile-wire, a knife-carrier mounted above the fabric and movable across the same, and a cutting-knife pivoted to said carrier so that its cutting portion can be swung into or out of the groove of the pile-wire, substantially as specified.

8. In pile-cutting mechanism for looms, the combination of a knife-carrier mounted above the fabric, a cutting-knife mounted upon said carrier so as to be moved into and out of cutting relation with the pile-loops, and a bar movable in respect to the knife-carrier for operating said knife, substantially as specified.

9. In pile-cutting mechanism for looms, the combination of a knife-carrier mounted above the fabric and movable across the same, a knife mounted on said carrier and movable into and out of cutting relation with the pile-loops, and a bar movable in respect to the knife-carrier and serving to move the cutting-knife into and out of cutting position, substantially as specified.

10. In pile-cutting mechanism for looms, the combination of a knife-carrier mounted above and movable across the fabric, one or more cutting-knives mounted upon said carrier, and mechanism whereby the movement of the carrier in both directions is effected by a pulling action, substantially as specified.

11. In pile-cutting mechanism for looms, the combination of a knife-carrier mounted above the fabric and movable across the same, a knife mounted on said carrier and movable into and out of cutting relation with the pile-loops, and pattern mechanism for governing the movement of the knife-carrier across the fabric, substantially as specified.

12. In pile-cutting mechanism for looms, the combination of a knife-carrier mounted above and movable across the fabric and having a knife movable into and out of cutting relation with the pile-loops, a bar movable in relation to the knife-carrier and serving to move the cutting-knife into and out of cutting position, and pattern mechanism governing the movement of said knife-carrier and controlling-bar, substantially as specified.

13. In pile-cutting mechanism for looms, the combination of a knife-carrier mounted above and movable across the fabric, a knife mounted on said carrier so as to be movable into and out of cutting relation with the pile-loops, and two sets of pattern mechanism one governing the movement of the knife, in one direction and the other governing its movement in the opposite direction, substantially as specified.

14. In pile-cutting mechanism for looms, the combination of a knife-carrier mounted above and movable across the fabric, a knife mounted on said bar so as to be movable into and out of cutting relation with the pile-loops, a bar movable in respect to the knife-carrier for throwing the cutting-knife into and out of cutting position, and two sets of pattern mechanism, one controlling the movement of the knife-carrier in one direction and also controlling the movement of the knife-operating bar, and the other controlling the movement of the knife-carrier in the opposite direction, substantially as specified.

15. In pile-cutting mechanism for looms, the combination of a knife-carrier mounted above the fabric and having a knife movable into and out of cutting relation with the pile-loops, a bar for moving said cutter into and out of cutting position, and pattern mechanism governing the extent of movement of said knife-operating bar, substantially as specified.

16. In pile-cutting mechanism for looms, the combination of a knife-carrier mounted above the fabric, a knife pivoted to the said carrier and movable into and out of cutting relation with the pile-loops, a bar engaging said knife and swinging it into and out of cutting position, and pattern mechanism for governing the extent of movement of said knife-operating bar, substantially as specified.

17. In pile-cutting mechanism for looms, the combination of a knife-carrier mounted above the fabric and having a knife movable into and out of cutting relation with the pile-loops, and adjustable means for arresting the downward movement of the knife when it has reached the proper cutting position, substantially as specified.

18. In pile-cutting mechanism for looms, the combination of a knife-carrier mounted above the fabric and movable across the same, a knife mounted on said carrier and movable into and out of cutting relation with the pile-loops, and adjustable means for arresting the downward movement of the knife when it has reached its proper cutting position, substantially as specified.

19. In pile-cutting mechanism for looms, the combination of the knife-carrier mounted above and movable across the fabric, a knife mounted on said carrier so as to be movable into and out of cutting relation with the pile-loops, a bar for actuating said knife, and an adjustable stop whereby the movement of the knife-operating bar after it has moved the knife into cutting position, will be transmitted to the knife-carrier, substantially as specified.

20. In pile-cutting mechanism for looms, the combination of a knife-carrier mounted above the fabric, a knife mounted on said carrier and movable into and out of cutting relation with the pile-loops, means for moving the knife into and out of cutting position, and means for adjusting the knife-carrier into different lateral relations in respect to the fabric, substantially as specified.

21. In pile-cutting mechanism for looms, the combination of the knife-carrier mounted above and movable across the fabric, and a knife mounted on said carrier, with means for laterally shifting the limits of movement of the knife-carrier whereby the knives may act successively upon different lateral portions of the fabric, substantially as specified.

22. In pile-cutting mechanism for looms, the combination of a knife-carrier mounted above and movable across the fabric, a knife mounted on said carrier and movable into and out of cutting relation with the pile-loops, means for moving the knife into and out of cutting position, and provision for laterally shifting the limits of movement of the knife-carrier so as to cause the knives to act upon different lateral portions of the fabric, substantially as specified.

23. In pile-cutting mechanism for looms, the combination of a knife-carrier mounted above the fabric, a series of knives thereon movable into and out of cutting relation with the pile-loops, means for moving the knife-carrier rearwardly with yielding pressure, and a series of stop-fingers movable with the knife-carrier and adapted to contact with the foremost of the inserted pile-wires at different points in its length, substantially as specified.

24. In pile-cutting mechanism for looms, the combination of a knife-carrier mounted above and movable across the fabric, a knife thereon movable into and out of cutting relation with the pile-loops, a bar movable in respect to the knife-carrier for moving said knife into and out of cutting position, means for moving said knife-operating bar, and a frictional retarding device acting upon the knife-carrier and serving to prevent movement of the same with the knife-operating bar until said friction has been overcome, substantially as specified.

25. In pile-cutting mechanism for looms, the combination of a knife-carrier mounted above and movable across the fabric, a knife carried by said bar and movable into and out of cutting relation with the pile-loops, a second bar movable in respect to the first for moving said knife into and out of cutting position, means for moving said second bar, a frictional retarding device for preventing movement of the knife-carrying bar with the knife-operating bar and engaging portions of the two bars for causing their joint movement, substantially as specified.

26. The combination in pile-cutting mechanism for looms, of a knife-carrier and an operating-slide therefor having a cam and a spring-actuated bolt interposed between said cam and the end of the knife, substantially as specified.

27. The combination in pile-cutting mechanism for looms, of a knife-carrier, a bar movable in respect thereto for adjusting the knives to operative or inoperative position, a slide carrying a pattern-cam and a spring-actuated bolt interposed between said cam and the knife-carrier and knife-actuating bar, substantially as specified.

28. The combination in pile-cutting mechanism for looms, of a knife-carrier with knives pivoted thereto and yielding means for holding said knives in lateral position in respect to the carrier, substantially as specified.

29. The combination in a loom for weaving pile fabrics, of the pile-wire inserting and withdrawing mechanism having as one of its elements a reciprocating slide, and pile-cutting devices mounted above the fabric and having as elements a laterally-movable knife-carrying bar and a laterally-movable knife-operating bar, said bars receiving their movement from the reciprocating slide of the pile-wire mechanism, substantially as specified.

30. The combination in a loom for weaving pile fabrics, of pile-wire inserting and withdrawing mechanism having as one of its elements a reciprocating slide, a knife-carrier mounted above the fabric, and a pattern-cam mounted on said pile-wire slide and serving to operate the knife-carrier, substantially as specified.

31. The combination in a loom for weaving pile fabrics, of the pile-wire mechanism having as one of its elements a reciprocating slide, a knife-carrier mounted above the fabric and having knives movable into and out of cutting position, a knife-operating bar movable in respect to the knife-carrier, and a pattern-cam mounted on the pile-wire slide and serving to operate the knife-carrier and knife-actuating bar, substantially as specified.

32. The combination in a loom for weaving pile fabrics, of a knife-carrier mounted above the fabric, pile-wire mechanism having as one of its elements a reciprocating slide, a pattern-cam mounted on said slide and serving to operate the knife-carrier and mechanism operated by the movement of the slide for imparting movement to said cam, substantially as specified.

33. The combination in a loom for weaving pile fabrics, of a knife-carrier mounted above the fabric, pile-wire mechanism having as one of its elements a reciprocating slide, pattern-cams for determining the movement of the knife-carrier in each direction, and mechanism operated by the movement of the reciprocating slide and serving to impart movement to said pattern-cams, substantially as specified.

34. The combination in pile-cutting mechanism for looms, of a knife-carrier mounted above the fabric, a pattern-cam for determining the movement of said knife-carrier in one direction, and yielding tension devices for moving the knife-carrying bar in the opposite direction, substantially as specified.

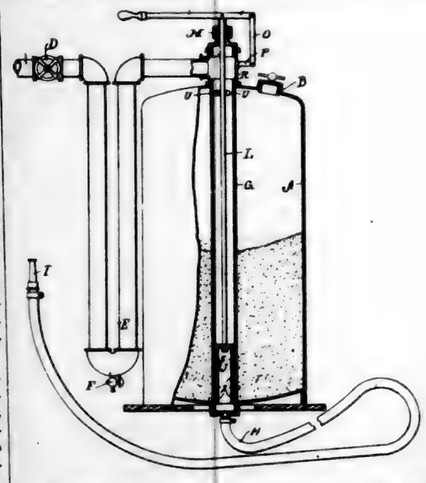
35. The combination in pile-cutting mechanism for looms, of a knife-carrier mounted above the fabric, a pattern-cam for determining the movement of said knife-carrier in one direction, and yielding tension devices for moving the knife-carrying bar in the opposite direction, and a second pattern-cam for limiting such movement, substantially as specified.

36. In pile-cutting mechanism for looms, the combination of a knife-carrier mounted above the fabric, and adjusting mechanism for the knife-carrier having a series of stop-fingers adapted to contact with the foremost of the inserted pile-wires at different points in its length, said adjusting mechanism being so mounted that the outermost stop-finger can move forwardly as soon as the end of the pile-wire has been withdrawn past the same, substantially as specified.

37. The combination in a loom for weaving pile fabrics, of pile-wire inserting and withdrawing mechanism having as one of its elements a reciprocating slide with catch for engaging the heads of the pile-wires, pile-cutting mechanism operated by said slide, and a push-rod whereby the heads of the pile-wires may be thrust rearwardly out of range of the withdrawing mechanism, substantially as specified.

709,448. SAND-BLAST-CONTROLLING APPARATUS. JOSEPH SHAVER, Milwaukee, Wis. Filed Aug. 5, 1901. Renewed July 2, 1902. Serial No. 114,122. (No model.)

Claim.—1. In a sand-blast-controlling device, the combination of an air-tight sand-receiving reservoir; a cylinder, provided at its lower end with a plurality of apertures through its vertical walls, extending longitudinally through said reservoir; an air-duct communicating from the source of pressure through the upper end of said cylinder with said sand-reservoir above the sand therein; a hose connected with the lower end of said cylinder; a vertically-moving bollow plunger, provided with apertures at its upper end, located within said cylinder, and adapted to control the passage of sand through said apertures; a rod communicating from said plunger with the exterior of said reservoir; and means for raising and lowering said plunger, and opening and closing said apertures, as set forth.



2. In a sand-blast-controlling device, the combination of an air-tight sand-receiving reservoir, a cylinder, provided at its upper and lower ends with a plurality of apertures formed through its vertical walls; extending longitudinally through said reservoir and protruding at its respective ends, through the ends of said reservoir; an air-duct communicating from a source of pressure with the upwardly-protruding end of said cylinder, a hose connected with the lower protruding end of said cylinder; a vertically-adjustable, hollow plunger, provided with apertures at its upper end, located in said cylinder and adapted to control the passage of sand through said apertures; a rod communicating from said plunger through a stuffing-box with the exterior of said reservoir; and a lever pivotally connected with the protruding end of said rod, substantially as and for the purpose specified.

3. In a sand-blast-controlling device, the combination of an air-tight sand-receiving reservoir; a cylinder, provided at its upper and lower ends with a plurality of apertures through its vertical walls, extending longitudinally through said reservoir; an air-duct, provided with U-shaped bends (in the lower end of which is a petcock) connected with the upper end of said cylinder; a hose connected with the lower end of said cylinder; a vertically-moving, hollow plunger, provided with apertures at its upper end, located within said cylinder, and adapted to control the passage of sand through said apertures; a rod communicating from said plunger with the exterior of said reservoir; and means for raising and lowering said plunger, and opening and closing said apertures, all substantially as and for the purpose set forth.

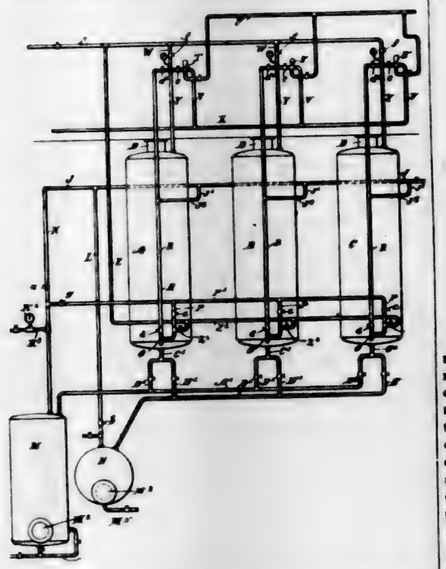
709,449. SINGLE PERCH-GEAR FOR VEHICLES. FRANK B. WILCOX, Mechanicsburg, Pa. Filed Aug. 2, 1902. Serial No. 118,084. (No model.)

Claim.—1. The herein-described means for securing the end of a perch to an axle, consisting of the perch heel-iron 26, the three-prong saddle-clip, and the top reach-iron 28 having a perforated upwardly-turned end.

2. The combination with an axle, axle-bed, and lower spring-leaves, of a recessed perch heel-iron; a three-prong clip; a perch; a top reach-iron having an upwardly-turned perforated end; and means for securing the perch to the irons, and the upwardly-turned end of the top perch-iron to the axle-bed.

3. The herein-described three-prong saddle-clip, having legs which are cylindrically shaped at the extreme ends and flattened throughout the remaining portions thereof, the downwardly-extending flange 33 upon one side, and the outwardly-extending ends 34, 34, as set forth.

709,450. APPARATUS FOR TREATING GARBAGE. STEPHEN R. WILSON, Frenchtanding, Mich. Original application filed Sept. 6, 1897, Serial No. 650,936. Divided and this application filed Apr. 11, 1902. Serial No. 102,443. (No model.)



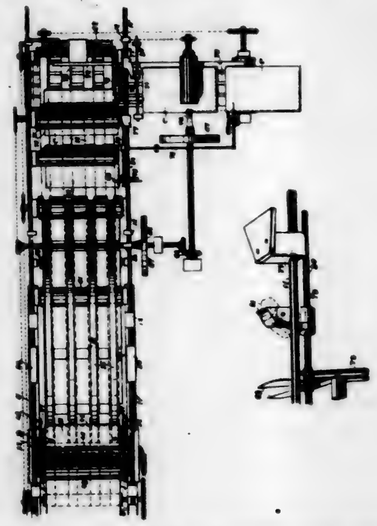
Claim.—1. In an apparatus for treating garbage and like material, the combination of a series of digesting-tanks; a fluid-supply connected thereto; a high-pressure tank connected with said fluid-supply and with the series of digesting-tanks; a low-pressure tank; connections between said low-pressure tank and the draw-off of said digesting-tanks; and connections between said low-pressure tank and the cooking apparatus of said digesting-tanks.

2. In an apparatus for treating garbage and the like; the combination of a series of digesting and compression tanks; a fluid-pressure-supply pipe connected thereto with the cooking apparatus thereof and with the top of said tanks; a high-pressure tank connected with the fluid-supply and with the draw-off of said digesting-tanks; a low-pressure tank connected with the draw-off of said digesting-tanks; a blow-off main; and connections between said blow-off main and the cooking apparatus of the digesting-tanks, substantially as and for the purpose described.

3. In an apparatus for treating garbage and like material, the combination of a series of digesting and compression tanks; a fluid-pressure-supply pipe; connections between said pipe and the cooking apparatus of the tanks and the upper ends of the tanks; a high-pressure tank connected with the fluid-pressure supply and the draw-off of the digesting-tanks; a low-pressure tank connected to the draw-off of the digesting-tanks and also with the fluid-pressure supply; a blow-off main; connections between said blow-off main and the low-pressure tank; a deodorizer intermediate the blow-off main and the connections from the low-pressure tank; and a water-supply for said deodorizer.

4. In an apparatus for treating garbage and the like, the combination of a series of digesting-tanks; cooking apparatus for said tanks; a low-pressure tank connected to said digesting-tanks; and connections between said low-pressure tank and said cooking apparatus, substantially as described, whereby the cooking agent may be passed from said low-pressure tank into the cooking apparatus of the digesting-tanks.

709,451. BAG-MAKING MACHINE. JOHN F. ANES, Portland, Oreg. Filed Feb. 28, 1900. Serial No. 6,827. (No model.)



Claim.—1. An apparatus for the manufacture of bags comprising mechanism for supplying the material, mechanism for feeding the material intermittently, a cutting mechanism actuated during the intermission of the advance of the material, for severing the material into lengths, means for folding the severed material, a sewing-machine and means for transferring the folded material thereto, a second transferring mechanism operating at right angles with the first-named transferring means, a second sewing-machine for closing the open side of the bag, thread-cutting appliances for severing the thread after the bag passes each sewing-machine, and a single power device connected with the feeding devices, the severing mechanism, the folding devices, and the thread-cutting appliances.

2. In a bag-making machine, means for supplying the fabric continuously, means including a reciprocating rack and a pawl-and-ratchet mechanism by which the material is advanced and stopped intermittently, a mechanism for cutting the material into lengths suitable for the bags to be made, means for adjusting the movement of the rack whereby the advance of the material is varied to suit the size of the bag to be made, and means connected to the rack for operating the cutting mechanism.

3. In a bag-making machine, the combination of means for supplying material continuously, a feed mechanism, means for cutting the material into lengths at each intermission of its forward movement, a reciprocating slide mechanism for operating the feed mechanism, and means connected to said slide mechanism for operating the cutting mechanism.

4. In a bag-making machine, the combination of mechanism for supplying the material, a feed mechanism for the material, means for actuating the feed mechanism, a cutting mechanism for severing the material into lengths, a folding mechanism for the severed portions, a transfer mechanism for the folded portions, stitch-forming mechanism, a horizontally-reciprocating slide mechanism and connections between the same and the cutting and folding mechanisms whereby the said cutting and folding mechanisms are operated by the single reciprocating slide mechanism.

5. The combination of mechanism for supplying the material, a feed mechanism including rollers, a reciprocating rack and pawl-and-ratchet devices, means for regulating the movement of the rack and the consequent advance of the fabric, a cutting mechanism, a horizontal slide mechanism movable with said rack, and connections between said cutting mechanism and the slide mechanism whereby the former is operated by the latter at each intermission of the forward movement of the material.

6. In a bag-making machine, feed-rollers between which the fabric passes, a reciprocating rack at each side of the machine and coacting devices by which the rollers are intermittently turned to advance the fabric, other feed-rollers between which the material passes, a transversely-operating cutter, slide-rods connected with said racks and means connecting said rods with the cutter and operating the latter on the return movement

of the rack whereby the fabric is severed into lengths at each intermission of the forward movement of the fabric.

7. In a bag-making machine, mechanism for advancing the fabric intermittently, a cutting mechanism, a horizontal slide mechanism operated in unison with the mechanism for advancing the fabric, and connections including inclined blocks or plates connected to the slide mechanism and pivoted arms between the blocks or plates and the cutting mechanism, and capable of operating the latter for severing the fabric at each intermission of the forward movement of said fabric.

8. In a bag-making machine, means for supplying the material, mechanism by which the fabric is intermittently advanced, a horizontal slide-rod at each side of the machine and operating in unison with the means for advancing the fabric, a cutting mechanism, a folding mechanism for the severed portions, connections between the slide-rods and the cutting mechanism and other connections between these same rods and the folding mechanism whereby both the cutting and folding mechanisms are operated by a single slide mechanism.

9. In a bag-making machine, mechanism by which the fabric is intermittently advanced, a double set of rollers between which the fabric passes, a cutting device intermediate the two sets of rollers, and mechanism consisting of a reciprocating rod, a fulcrumed lever and an inclined plate carried by said rod adapted to engage said lever whereby the cutting device is actuated.

10. In a bag-making machine, mechanism for advancing the fabric intermittently through the machine, a supporting-belt and rollers over which it passes, said belt serving to support and carry the fabric for the bags, rollers over which said carrying-belt passes whereby its direction is changed to take it temporarily out of the line of travel of the fabric whereby the latter alone is presented between the rollers and a shears between the blades of which the fabric passes at this interval, and mechanism including a slide-rod at each side of the machine, a fulcrumed arm at each end of the movable shear-blade, and devices on the slide-rods to engage said arms and thereby operate said shear-blade by which the shears are actuated to sever the fabric.

11. In a bag-making machine, mechanism by which the bag fabric is advanced intermittently through the machine, a supporting-belt upon which the fabric rests, two pairs of rollers between which the fabric passes and by which it is advanced, a direction-roller out of the line of said rollers over which the carrying-belt passes while the fabric passes in a straight line between the two rollers, a stationary and a movable shear-blade between which the fabric passes in moving from one pair of rollers to the other, a slidable rod or rods movable in unison with the movement of the fabric-advancing mechanism, a fulcrumed lever connecting with the movable blade of the shears, an incline carried by the sliding rod adapted to engage the lever on the return movement of the rod and while the fabric is stationary to actuate the shear-blade and sever the fabric, and a spring by which the movable blade is separated from its fellow to allow a further forward movement of the fabric.

12. In a bag-making machine, mechanism for advancing the fabric intermittently, a cutter and a mechanism including a reciprocating slide-rod and connections therefrom for actuating the cutter during the intermission of the forward movement of the fabric whereby the fabric is separated into lengths, rollers between which the separated pieces pass and by which they are advanced from the cutter, folding-rollers situated below the line of movement of the fabric, a vertically-reciprocating blade by which the severed section is introduced between the rollers and the fabric is folded to the form of a bag, and connections between said slide-rod and the folding-blade whereby the latter operated.

13. In a bag-making machine, mechanism for feeding the fabric, and moving it intermittently through the machine, mechanism for severing the fabric into lengths, a mechanism for folding the severed sections, consisting of rollers revolvable in contact beneath the horizontal line of travel of the fabric, fulcrumed levers, a folding-blade carried thereby and adapted to press the fold of the fabric section between the folding-rollers, a longitudinally-reciprocating rod, said rod having an inclined surface engaging the lever which carries the folder-blade and operating it during the intermission of the forward movement of the fabric.

14. In a bag-making machine, mechanism for supplying a fabric and advancing it intermittently, mechanism for severing the fabric into lengths sufficient for bags, rollers between which the severed fabric is advanced, a folding device consisting of contact-rollers situated below the line of travel of the fabric, a blade by which the bight of the fabric is pressed down between the rollers, and fulcrumed levers by which the folding-blade is carried, reciprocating rods and inclines carried respectively thereby adapted to engage the levers and actuate the folder during their backward reciprocation, other fulcrumed levers connected with the blade-actuating levers, said second levers carrying the journal-boxes of one of the feed-rollers, and movable in unison with the first movement of the folder so as to raise said roller and release the pressure upon the fabric whereby the latter is left free to be moved by the folder.

15. In a bag-making machine, mechanisms for supplying the fabric, advancing it intermittently and severing it into lengths, a folder consisting of a double set of contact-rollers, and a vertically-movable blade between the two sets of rollers and by which the severed sections of the fabric are pressed between the rollers, a slide-rod and connections for operating the severing mechanism and folding-blade and fulcrumed and spring-pressed levers in which one of the folding-rollers is journaled whereby the roller is allowed to yield for the passage of thickened or creased portions of the fabric.

16. In a bag-making machine, mechanisms for advancing the fabric, cutting it into lengths and folding the severed lengths centrally so as to bring the edges together, a single horizontally-reciprocating mechanism, connections between the same and the cutting mechanism, and other connections between said reciprocating mechanism and the folding mechanism, a carrying-belt and tapes between which the folded fabric is delivered and returned to its original plane of travel, a sewing-machine disposed with relation to the line of travel of the folded fabric so that one end of the fabric passes through the machine and is sewed together.

17. In a bag-making machine, mechanisms for supplying the fabric continuously and advancing it intermittently, mechanism for severing the fabric into lengths to form bags, mechanism whereby the fabric is centrally folded to bring the edges together, a sewing-machine through which one end of the folded section is passed and sewed, a thread-cutter, feed-rollers between which the bag-section is received after leaving the thread-cutter, a stop against which the bag is delivered therefrom, a transversely-rotating roller and means for raising it while the bag is being advanced, and afterward depressing it so as to change the direction of motion of the bag, a second sewing-machine through which the edges of the bag are passed and sewed, and a device for cutting the thread before the bag is delivered from the machine.

18. In a machine for making bags, mechanisms for supplying the fabric continuously and advancing it intermittently, mechanism for severing it into lengths for folding it and sewing the end of the folded section, mechanism for changing the direction of motion of the bag at right angles with its first movement, a second sewing mechanism through which the unfinished folded edges are passed to complete the bag, and thread-cutters whereby the thread of each sewing-machine is cut after the bag leaves it, said cutters being actuated in the intervals of the forward movement of the fabric.

19. In a bag-sewing machine, mechanisms for cutting, folding and sewing the bag, a thread-cutting mechanism, longitudinally-reciprocating rods one at each side of the machine, inclined blocks or plates carried by said rods, and operative connections between the cutting mechanism, the folding mechanism and the thread-cutting mechanism operated by said blocks or plates.

20. In a bag-making machine, a mechanism for advancing the fabric intermittently, and mechanism for cutting it into lengths, and for folding said lengths centrally to bring the edges together, a sewing-machine through which one end of the folded section is passed and sewed, a thread-cutter acting after the bag has passed through the machine, a stop against which a partially-finished bag is delivered, a roller having its ends journaled in lever-arms, mechanism consisting of slidable rods with inclined blocks or plates adapted to engage the roll-carrying lever-arms whereby the roller is raised to allow the edge of the bag to pass beneath it from the first sewing-machine, and depressed so as to advance the bag at right angles with its former line of travel, and a second sewing-machine through which the unfinished edge of the bag is passed by said movement.

21. The combination in a bag-making machine of mechanism by which a sheet of material is intermittently advanced; a cutter transverse to the line of movement of the material; means for actuating said cutter to sever the material during the intermission of the forward movement; a folder transverse to the line of travel; means by which severed blanks are advanced to the folder; means for actuating the folder; and means for sewing superposed edges of the folded blank.

22. The combination in a bag-making machine of mechanism including feed-rolls and mechanism by which a sheet of material is intermittently advanced, a cutter transverse to the line of movement and means by which the cutter is moved to sever the material during the intermission of the forward movement, a folder transverse to the line of travel, means by which the severed material is advanced beneath the folder, means by which the folder is reciprocated and means for uniting superposed edges of the folded blank.

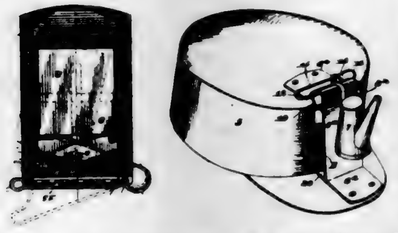
23. The combination in a bag-making machine of mechanism including feed-rolls; a transversely-located cutter, and means for operating the same; a transversely-located folder succeeding the cutter, and means for operating the folder; means by which a sheet of material is intermittently advanced, and severed; means by which the severed section is advanced and arrested beneath the folder; continuously-traveling belts to which the folded material is delivered; and sewing mechanisms to which the belts transmit the folded material, to unite superposed edges of the folded material.

24. An apparatus for the manufacture of bags, consisting of mechanism by which a sheet of material is intermittently advanced, a transversely-disposed cutter and mechanism actuating it while the material is at rest, a transversely-disposed folding-blade, means for intermittently advancing the severed material until its center is beneath the folder, means for subsequently reciprocating the folder, a continuously-traveling carrier to which the folded material is delivered, and sewing-machines located in the path of its travel whereby the bottom and open side are successively sewed.

25. In a bag-sewing machine the combination of feed-rolls and mechanism by which a sheet of material is intermittently advanced, a cutting mechanism next succeeding the feed mechanism and severing a portion of the fabric while the latter still remains in an unfolded condition; and a folding mechanism next succeeding the cutting devices and having a folding-blade arranged transverse to the line of movement of the material, for folding the severed blank across its shortest diameter and sewing mechanism for uniting the superposed edges of the folded material.

26. In a bag-making machine the combination of means for intermittently advancing a sheet of material, a cutting mechanism, and a folding mechanism said cutting mechanism being interposed between the folding and feeding mechanisms and severing the fabric crosswise into blanks, and said folding mechanism folding said blanks transversely so as to bring the two severed edges together, means for uniting said edges by stitching and independent means for sewing the two parts of the same finished edge to form the bottom of the bag.

709,452. **MATCH-SAFE ATTACHMENT FOR MINERS' LAMP-HOLDERS.** JAMES A. BROWN, Pictou, Colo., assignor of one-half to George M. Toumbling, Pictou, Colo. Filed Feb. 17, 1902. Serial No. 94,539. (No model.)



Claims.—1. The combination with a lamp-holder of the class described, of a match-box pivotally mounted on the inner surface of the holder and provided with a hinged lid and means connected with the lid for opening the same as the box is turned on its pivot, substantially as described.

2. The combination with a lamp-holder adapted to be attached to a cap, and having a flange projecting rearwardly from its upper extremity, of a match box or safe pivotally mounted on the holder below the flange and provided with a hinged lid, and means connected with the lid for opening the same as the box is turned on its pivot, substantially as described.

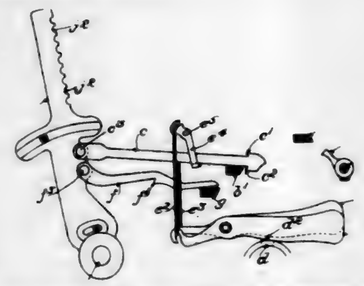
3. The combination of a lamp-holder comprising an upwardly-projecting plate having flanges projecting rearwardly from its opposite extremities, a match box or safe pivotally attached to said plate between the said flanges and having a hinged lid, and means connected with the lid for opening the same as the box is turned on its pivot, substantially as described.

4. The combination with a lamp-holder of the class described, of a match-box pivotally mounted on the holder and provided with a hinged lid, and suitable means mounted on the lamp-holder and connected with the lid for opening the same as the box is moved on its pivot, substantially as described.

5. The combination with a lamp-holder of the class described, of a match-box pivotally mounted on the holder and provided with a hinged lid, and a device movably mounted on the lamp-holder and connected with the box and lid whereby as the said device is actuated, the box is moved on its pivot and the lid opened, substantially as described.

6. The combination with a lamp-holder of the class described, of a match-box pivotally mounted on the inner surface of the holder and provided with a hinged lid, and a wire connected at one extremity with the hinge-pin of the lid, extending outwardly beyond the lamp-holder on one side where it is bent and carried in the opposite direction a suitable distance where it is coiled around a pin on the holder, and finally bent downwardly and carried across the match-box, its free extremity being passed through a loop or eye formed on the lid, substantially as described.

709,453. **SHEDDING MECHANISM FOR LOOMS.** GEORGE W. STAFFORD, Warwick, R. I., assignor to the Geo. W. Stafford Company, Readville, Mass., a Corporation of New York. Filed Jan. 2, 1902. Serial No. 88,028. (No model.)



Claims.—1. In double-acting shedding mechanism for looms, in combination, the two lifters, the hook between said lifters, having engaging shoulders at its opposite edges, and adapted to be operated by either lifter to elevate the corresponding harness-frame when required, pattern devices to control the engagement of the said hook with the required lifter, and separate holding means for locking under the control of the pattern devices said harness-frame in its elevated position, substantially as described.

2. In double-acting shedding mechanism for looms, in combination, the two lifters, the hook between said lifters, having engaging shoulders at its opposite edges, and adapted to be operated by either lifter to elevate the corresponding harness-frame, pattern devices to control the engagement of the said hook with the respective lifters, and, a holding-hook, controlled by the said pattern devices, and adapted to lock the harness-frame in its elevated position, substantially as described.

3. In double-acting shedding mechanism for looms, in combination, the alternately-acting lifters, the hook between said lifters and having engaging shoulders at its opposite edges, the holding-hook partaking of the movements of the first-mentioned hook in shedding; the holding-bar cooperating with said holding-hook, and, pattern devices to control the engagement of the first-mentioned hook with the respective lifters and also control the engagement of the said holding-hook with said holding-bar, substantially as described.

4. In double-acting shedding mechanism for looms, in combination, the alternately-acting lifters, the hook between said lifters and having engaging shoulders at its opposite edges, the movable transmitter adapted to be connected with the corresponding harness-frame and having said hook movably connected therewith, the holding-hook also movably connected with the said transmitter, the holding-bar coöperating with said holding-hook, and pattern devices controlling the engagement of the first-mentioned hook with the respective lifters and also controlling the engagement of the said holding-hook with said holding-bar, substantially as described.

5. In double-acting shedding mechanism for looms, in combination, the alternately-acting lifters, the hook between said lifters and having engaging shoulders at its opposite edges, the harness-lever having said hook connected thereto, the holding-hook also connected to the said harness-lever, the holding-bar cooperating with said holding-hook, and pattern devices controlling the engagement of the first-mentioned hook with the respective lifters and also controlling the engagement of the said holding-hook with said holding-bar, substantially as described.

6. In double-acting shedding mechanism for looms, in combination, the two lifters working alternately, the hook between said lifters having shoulders at its opposite edges for engagement with the respective lifters, a pattern-surface, a pattern-finger coacting with said pattern-surface and means intermediate the same and said hook to control the engagement of the said hook with one of said lifters, and a second pattern-finger coacting with the said pattern-surface and means intermediate the same and the said hook to control the engagement thereof with the other lifter, substantially as described.

7. In a double-acting shedding mechanism for looms, in combination, the two lifters acting alternately, the double hook between said lifters, a pattern-surface, a pair of pattern-fingers, a needle between one of said pattern-fingers and said hook, a needle and lever between the other of said pattern-fingers and said hook, substantially as described.

8. In double-acting shedding mechanism for looms, in combination, the two lifters, the double hook between said lifters, a pattern-surface, a pattern-finger and means intermediate the same and said hook to control the engagement of the said hook with one of said lifters, a second pattern-finger and means intermediate the same and the said hook to control the engagement thereof with the other lifter, and means to hold the harness-frame which is operated by the said hook locked in the elevated position thereof, substantially as described.

9. In double-acting shedding mechanism for looms, in combination, two lifters acting alternately, a double hook between said lifters and adapted to be engaged with either lifter, a holding-hook, a pattern-surface, a pair of pattern-fingers and means for operating the holding-hook therefrom and also transmitting movement to the double hook from the respective pattern-fingers, in opposite directions, respectively, to occasion the engagement of said double hook with the respective lifters, substantially as described.

10. In double-acting shedding mechanism for looms, in combination, two lifters acting alternately, a double hook between said lifters, a movable transmitter adapted to be connected with a harness-frame and having said hook movably connected therewith, a holding-hook also movably connected with the said transmitter, the relatively stationary abutment engaged by said holding-hook, a pattern-surface, a pair of pattern-fingers and means for operating the holding-hook therefrom and also transmitting movement to the double hook from the respective pattern-fingers, in opposite directions, respectively, to occasion the engagement of said double hook with the respective lifters, substantially as described.

11. In double-acting shedding mechanism for looms, in combination, two lifters acting alternately, a double hook between said lifters, a harness-lever having said hook connected thereto, a holding-hook also connected to the said harness-lever, the relatively stationary abutment engaged by said holding-hook, a pattern-surface, a pair of pattern-fingers and means for operating the holding-hook therefrom and also transmitting movement to the double hook from the respective pattern-fingers, in opposite directions, respectively, to occasion the engagement of said double hook with the respective lifters, substantially as described.

12. In a double-acting shedding mechanism for looms, in combination, two lifters acting alternately, a double hook between said lifters, a holding-hook, a pattern-surface, a pair of pattern-fingers, a needle operated by one of said pattern-fingers and controlling the two hooks, and a needle and lever operated by the other of said pattern-fingers and controlling the hook first mentioned, substantially as described.

13. In double-acting shedding mechanism for looms, in combination, the upper and lower lifters acting alternately, the hooks between said lifters, the pattern devices constructed to cause said hooks to occupy normally an intermediate disengaged position, and arranged to indicate the hooks into engagement with the respective lifters at the required times for the elevation of the harness-frame, and means independent of the pattern devices acting upon the said hooks to connect with the upper lifter at the outer extreme of its stroke the hooks which should accompany the said lifter in its ingoing movement for the purpose of lowering the corresponding harness-frames, substantially as described.

14. In double-acting shedding mechanism for looms, in combination, the upper and lower lifters acting alternately, the hooks coöperating with the said lifters, the pattern devices provided with a pattern-surface having pegs or pins to indicate for the elevated position of the harness-frames, and means independent of the pattern devices to raise into engagement with the upper lifter at the outer extreme of its stroke the hooks pertaining to uplifted harness-frames and not already engaged with said lifter, to thereby connect with the latter hooks which should accompany said lifter in its ingoing movement, substantially as described.

15. In a double-acting shedding mechanism for looms, in combination, the two lifters acting alternately, the series of hooks coöperating with the said lifters, locking means whereby the harness-frames may be held in their elevated position for two or more picks, pattern devices controlling the engagement of said series of hooks with the lifters to occasion the elevation of the harness-frames, and the action of the said locking means, and means independent of the pattern devices, to connect with the upper lifter at the outer extreme of its lift the hooks pertaining to elevated harness-frames which should accompany said upper lifter in its ingoing movement, substantially as described.

16. In a double-acting shedding mechanism for looms, in combination, the two lifters acting alternately, the series of hooks coöperating with the said lifters, locking means whereby the harness-frames may be held in their elevated positions for two or more picks, pattern devices controlling the engagement of said series of hooks with the lifters to occasion the elevation of the harness-frames, and the action of the said locking means, and the hook-shift bar to place the hooks pertaining to elevated harness-frames in position to engage with the upper lifter, substantially as described.

17. In a double-acting shedding mechanism for looms, in combination, the two lifters acting alternately, the series of hooks coöperating with the said lifters, the holding-hooks, the pattern devices whereby the engagement of the hooks of said series with the respective lifters is controlled, and also the action of said holding-hooks, and means independent of the pattern devices to connect with the upper lifter at the outer extreme of its lift the hooks pertaining to elevated harness-frames which should accompany said upper lifter in its ingoing movement, substantially as described.

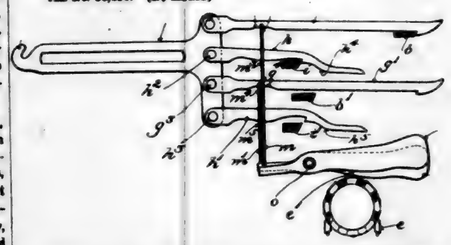
18. In a double-acting shedding mechanism for looms, in combination, the two lifters acting alternately, the series of hooks coöperating with the said lifters, the holding-hooks, the pattern devices whereby the engagement of the hooks of said series with the respective lifters is controlled and also the action of said holding-hooks, and the hook-shift bar to place the hooks pertaining to elevated harness-frames in position to engage with the upper lifter-bar, substantially as described.

19. In shedding mechanism for looms, in combination, a hook adapted to be connected operatively with a harness-frame, a lifter to operate said hook, pattern devices to control the engagement of said hook by said lifter, a holding-bar, and a holding-hook partaking of the movements in shedding of the hook, first mentioned, engaging with said holding-bar under control of said pattern devices and provided with means to cause its shoulder to clear in the receding movement the member of the pattern devices which contacts with the holding-hook, substantially as described.

20. In shedding mechanism for looms, in combination, a hook adapted to be connected operatively with a harness-frame, a lifter to operate said hook, pattern devices to control the engagement of said hook by said lifter, a holding-bar, and a holding-hook partaking of the movements in shedding of the hook first mentioned, engaging with said holding-bar under control of said pattern devices, and provided with the cam to cause its shoulder to clear in the receding movement the member of the pattern devices which contacts with the holding-hook, substantially as described.

21. In shedding mechanism for looms, in combination, a hook adapted to be connected operatively with a harness-frame, a lifter to operate said hook, pattern devices controlling the engagement of said hook by said lifter and including a movable needle, a holding-bar, a holding-hook cooperating with said holding-bar, engaged by said needle, and having a cam-face which in the rearward movement of the holding-hook causes the shoulder thereof to clear the said needle, substantially as described.

709,454. SHEDDING MECHANISM FOR LOOMS. GEORGE W. STAFFORD, Warwick, R. I., assignor to the Geo. W. Stafford Company, Readville, Mass., a Corporation of New York. Filed Jan. 2, 1902. Serial No. 88,039. (No model.)



Claim.—1. In a double-acting shedding mechanism for looms, in combination, the lifters acting alternately, the holding-bars, two pairs of hooks, each pair respectively comprising a hook to engage with the corresponding lifter, and a holding-hook to engage with the corresponding holding-bar, means for transmitting to a harness-frame the movements which are communicated by the lifters to the hooks, and pattern devices whereby the engagement of the hooks with the lifters and holding-bar is controlled, substantially as described.

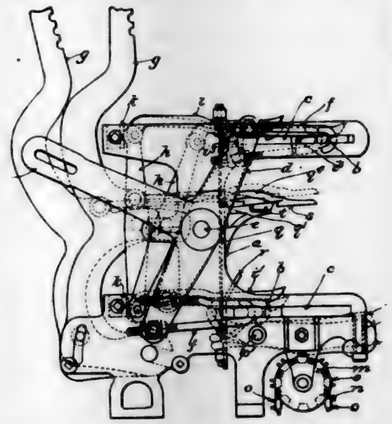
2. In a double-acting shedding mechanism for looms, in combination, the lifters acting alternately, the holding-bars, two pairs of hooks, each pair respectively comprising a hook to engage with the corresponding lifter, and a holding-hook to engage with the corresponding holding-bar, means for transmitting to a harness-frame the movements which are communicated by the lifters to the hooks, and pattern devices having a member which engages with the hooks of one pair to control the engagement of such hooks with the corresponding lifter and holding-bar, and a second member which engages with the hooks of the other pair for the like purpose, substantially as described.

3. In a double-acting shedding mechanism for looms, in combination, the lifters acting alternately, the holding-bars, two pairs of hooks, each pair respectively comprising a hook to engage with the corresponding lifter, and a holding-hook to engage with the corresponding holding-bar, means for transmitting to a harness-frame the movements which are communicated by the lifters to the hooks, and pattern devices having a needle which controls the engagement of the respective hooks of one pair with the corresponding lifter and holding-bar, and a second needle which controls the engagement of the respective hooks of the other pair with the corresponding lifter and holding-bar, substantially as described.

4. In a double-acting shedding mechanism for looms, in combination, the lifters acting alternately, the holding-bars, the transmitter, the two pairs of hooks connected therewith, each pair thereof comprising a hook to engage with the corresponding lifter and a holding-hook to engage with the corresponding holding-bar, and the pattern devices comprising essentially a pattern-surface, pattern-fingers, and needles operated by said pattern-fingers and coöperating, respectively with the respective pairs of hooks, substantially as described.

5. In a double-acting shedding mechanism for looms, in combination, the lifters acting alternately, the holding-bars, two pairs of hooks, each pair, respectively, comprising a hook to engage with the corresponding lifter, and a holding-hook provided with a cam to cause vertical movement of the hook as it moves across the corresponding holding-bar, to thereby clear the needle during the inward movement of the holding-hook, means for transmitting to a harness-frame the movements which are communicated by the lifters to the hooks, and pattern devices having a needle which controls the engagement of the respective hooks of one pair with the corresponding lifter and holding-bar, and a second needle which controls the engagement of the respective hooks of the other pair with the corresponding lifter and holding-bar, substantially as described.

709,455. SHEDDING MECHANISM FOR LOOMS. GEORGE W. STAFFORD, Warwick, R. I., assignor to the Geo. W. Stafford Company, Readville, Mass., a Corporation of New York. Filed Jan. 2, 1902. Serial No. 88,040. (No model.)



Claim.—1. In a double-acting shedding mechanism or dobby for looms, in combination, the transmitter, the lever connection connected with the said transmitter, the hooks or hooked jacks connected with the opposite extremities of the said lever connection, the lifters acting alternately, the pattern devices controlling the engagement of said hooks or hooked jacks with said lifters, and the holding-hook acting under control of the said pattern devices to retain the said transmitter in position to keep the corresponding harness-frame elevated, substantially as described.

2. In a double-acting shedding mechanism or dobby for looms, in combination, the transmitter, the lever connection connected with the said transmitter, the hooks or hooked jacks connected with the opposite extremities of the said lever connection, the lifters acting alternately, the pattern devices controlling the engagement of said hooks or hooked jacks with said lifters, the holding-bar, and the holding-hook carried by the said transmitter and engaging with the said holding-bar under control of the said pattern devices to retain the transmitter in position to keep the corresponding harness-frame elevated, substantially as described.

3. In a double-acting shedding mechanism or dobby in combination, the harness-lever, the lever connection, the hooks or hooked jacks connected with the opposite extremities of said lever connection, the lifters acting alternately, the pattern devices controlling the engagement of said hooks or hooked jacks with the lifters, and the holding-hook acting under control of said pattern devices to retain the transmitter in position to keep the corresponding harness-frame elevated, substantially as described.

4. In a double-acting shedding mechanism or dobby for looms, in combination, the transmitter, the lever connection pivoted to the said transmitter, the hooks or hooked jacks connected to the opposite extremities of the said lever connection, the lifters acting alternately, the holding-hook whereby said transmitter is retained in position to keep the corresponding harness-frame elevated, and the pattern devices including a hook or hooked-jack controlling member which controls also the action of the said holding-hook, substantially as described.

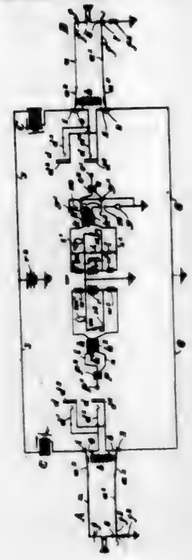
5. In a double-acting shedding mechanism or dobby for looms, in combination, the transmitter, the lever connection pivoted to the said transmitter, the hooks or hooked jacks connected to the opposite extremities of the said lever connection, the lifters acting alternately, the pattern devices, including one or more needles, to control the engagement of said hooks or hooked jacks with the said lifters, and the holding-hook also controlled by the said needle and acting to retain the said transmitter in position to keep the corresponding harness-frame elevated, substantially as described.

6. In a double-acting shedding mechanism or dobby for looms, in combination, the transmitter, the lever connection pivoted to the said transmitter, the hooks or hooked jacks connected to the opposite extremities of the said lever connection, the lifters acting alternately, the holding-hook connected with said transmitter and serving to retain the corresponding harness-frame in elevated position, and the pattern devices, including a jack-controlling needle which also controls the action of said holding-hook, substantially as described.

7. In a double-acting shedding mechanism or dobby for looms, in combination, the transmitter, the lever connection pivoted to the said transmitter, the hooks or hooked jacks connected to the opposite extremities of the said lever connection, the lifters acting alternately, the holding-bar, the holding-hook connected with said transmitter, serving to retain the corresponding harness-frame in elevated position, constructed to rest on said holding-bar while said harness-frame occupies a depressed position, and an upward bend as described to clear the controlling-needle, and the pattern devices, including a jack-controlling needle which also controls the action of said holding-hook, substantially as described.

REISSUES.

12,031. TELEPHONE SYSTEM. FRANCIS W. DUBRAY, Chicago, Ill., assignor to the Kellogg Switchboard and Supply Company, Chicago, Ill., a Corporation of Illinois. Filed June 17, 1902. Serial No. 112,060. Original No. 689,953, dated Dec. 31, 1901.



Claim.—1. The combination with a telephone-line, and a connection-terminal therefor, of a signal-controlling electromagnet normally connected with said line, a relay for disconnecting said electromagnet from the line, a cord-circuit terminating in a connecting-plug and adapted to be placed in conductive relation with the line, a source of electricity associated with the cord-circuit and adapted to be placed in the metallic circuit of the line, and means for closing the circuit of said source through said relay when connection is made with the line, said relay-circuit including a talking-strand of the cord-circuit, a main terminal of the connecting-plug, a line-contact and a portion of a talking-limb of the telephone-line with suitable return, substantially as described.

2. The combination with a telephone-line, of line-contacts therefor, a signal-controlling electromagnet normally connected therewith, a relay for disconnecting said electromagnet from the line, a cord-circuit terminating in a connecting-plug, and means for closing circuit through said relay over a circuit including the talking-strands of the cord-circuit, the main terminals of the connecting-plug, and the line-contacts of the telephone-line, substantially as described.

3. The combination with a telephone-line, of line-contacts therefor, a signal-controlling electromagnet normally connected therewith, a relay for disconnecting said electromagnet from the line, the windings of said relay being adapted to be connected between the opposite limbs of the telephone-line, a cord-circuit terminating in a connecting-plug, and means for closing circuit through said relay over a circuit including the talking-strands of the cord-circuit, the terminals of the connecting-plug, the line-contacts of the telephone-line and the portions of the talking-limbs of the telephone-line extending between the line-contacts and the winding of said relay, substantially as described.

4. The combination with a telephone-line, of a connection-terminal at the central station, a signal-controlling electromagnet normally connected therewith, a relay for disconnecting said electromagnet from the line, and having a winding adapted to be connected between the limbs of the telephone-line, a cord connector terminating in a connecting-plug, a source of electricity connected between the strands of said cord connecter, said source being adapted when the connecting-plug is inserted in the connection-terminal to send current over a circuit including the talking-strands of said cora connector, the terminals of the connecting-plug, the line-contacts of the telephone-line, and the portions of the talking-limbs of the telephone-line extending between said line-contacts and the relay, substantially as described.

5. The combination with a calling telephone-line and a connection-terminal normally disconnected therefrom, of a relay for connecting said connection-terminal with the line, a cord-circuit terminating in a connecting-plug, a source of electricity adapted to be included in the metallic circuit of the line to furnish current for talking purposes, and means for closing the circuit of said source through said relay when connection is made with the line in response to the call, said relay-circuit including one of the main terminals of the connecting-plug and a line-contact of the telephone-line, with suitable return, substantially as described.

6. The combination with a metallic telephone-line and a connection-terminal normally disconnected therefrom, of a relay for connecting said connection-terminal with the line, a cord-circuit terminating in a connecting-plug, a source of talking-current adapted to send current over the metallic circuit, and means for closing the circuit of said source through said relay when connection is made with the line, said relay-circuit including a talking-strand of the cord-circuit, a main terminal of the connecting-plug, a line-contact and a portion of a talking-limb of the telephone-line, substantially as described.

7. The combination with a telephone-line and a connection-terminal normally disconnected therefrom, of a relay for connecting said connection-terminal with the line, a cord-circuit terminating in a connecting-plug, and means for closing circuit through said relay continually during a connection and over a circuit including the talking-strands of the cord-circuit, the main terminals of the connecting-plug and the line-contacts of the connection-terminal, substantially as described.

8. The combination with a telephone-line and a connection-terminal normally disconnected therefrom, of a relay for connecting said connection-terminal with the line, a cord-circuit terminating in a connecting-plug, the winding of said relay adapted to be connected between the opposite limbs of the telephone-line, and means for sending current through said relay over a metallic circuit including the talking-strands of the cord connectors, the terminals of the connecting-plug, the line-contacts of the telephone-line and the portions of the talking-limbs of the telephone-line extending between the line-contacts and the winding of said relay, substantially as described.

9. The combination with a telephone-line and a connection-terminal normally disconnected therefrom, of a relay for connecting said connection-terminal with the line, and having a winding adapted to be connected between the limbs of the telephone-line, a cord-connector terminating in a connecting-plug, a source of electricity connected between the strands of said cord connector, said source being adapted when the connecting-plug is inserted in the connection-terminal to send current over a metallic circuit including the talking-strands of said cord connector, the terminals of the connecting-plug, the line-contacts of the telephone-line, and the portions of the talking-limbs of the telephone-line extending between said line-contacts and the relay, substantially as described.

10. The combination with a telephone-line adapted to be included in a talking-circuit, of a signal-controlling electromagnet normally connected therewith, a connection-terminal normally disconnected from said line, a relay for disconnecting said electromagnet from the line and for connecting said connection-terminal with the line, a central source of current adapted to be connected in the metallic circuit of the line to furnish current for talking purposes, and means for closing circuit through said relay over a portion of the talking-circuit when connection is made with the line, substantially as described.

11. The combination with a telephone-line, of a signal-controlling electromagnet normally connected therewith, a connection-terminal normally disconnected from said line, a relay for disconnecting said electromagnet from the line and for connecting said connection-terminal with the line, a cord connector terminating in a connecting-plug, a charging source of electricity connected therewith and adapted to be included in the metallic circuit of the line to furnish current for talking purposes, and means for closing the circuit of said source through said relay over a circuit including a talking-strand of the cord connector, a main terminal of the connecting-plug, a line-contact of the connection-terminal and a portion of the talking-limb of the telephone-line, substantially as described.

12. The combination with a telephone-line, of a signal-controlling electromagnet normally connected therewith, a connection-terminal normally disconnected from said line, a relay for disconnecting said electromagnet from the line and for connecting said connection-terminal with the line, a cord connector terminating in a connecting-plug and means for closing circuit through said relay over a metallic circuit including the talking-strands of the cord connector, the main terminals of the connecting-plug and the line-contacts of the connection-terminal, substantially as described.

13. The combination with a telephone-line, of a signal-controlling electromagnet normally connected therewith, a connection-terminal normally disconnected from said line, a relay for disconnecting said electromagnet from the line and for connecting said connection-terminal with the line, and having a winding adapted to be connected between the limbs of the telephone-line, a cord connector terminating in a connecting-plug, a source of electricity connected between the strands of said cord connector, said source of electricity being adapted when the connecting-plug is inserted in the connection-terminal to send current over a metallic circuit including the talking-strands of said cord connector, the terminals of the connecting-plug, the line-contacts of the telephone-line, and the portion of the talking-limbs of the telephone-line extending between said line-contacts and the relay, substantially as described.

14. The combination with a telephone-line having two limbs extending to the central station, of a connection-terminal for the line, a relay having movable contact members in which said limbs terminate, a magnet for actuating said movable members having the opposite ends of the winding connected between the line-contacts of the connection-terminal, back contacts for said movable relay members, a signal-controlling electromagnet included between said back contacts, front contacts for said relay members connected respectively with the line-contacts of the connection-terminal, a cord-circuit terminating in a connecting-plug, and a source of electricity associated with the cord-circuit, whereby when the connecting-plug is inserted in the connection-terminal, the circuit of said source is closed through the winding of said relay, substantially as described.

15. The combination with a telephone-line, of a connection-terminal normally disconnected therefrom, a relay for connecting said connection-terminal with the line, a central source of current adapted to be connected in the metallic circuit for talking purposes, means for operating said relay from said source when connection is made with the line by current flowing over a path including a portion of the talking-circuit, and means for sending a calling-current over the line of the called subscriber only and at the same time maintaining said relay in operated condition, substantially as described.

16. The combination with a telephone-line, of a connection-terminal normally disconnected therefrom, a relay for connecting said connection-terminal with the line, a charging source of electricity, and a calling source of electricity, said charging source of electricity being adapted to energize said relay when connection is made with the line, a ringing-key for connecting said calling source with the line of a called subscriber, and for disconnecting said charging source therefrom, and means for temporarily energizing said relay during the time the charging source is disconnected by the ringing-key, substantially as described.

17. The combination with a telephone-line, of a connection-terminal at the central station normally disconnected therefrom, a relay for connecting said connection-terminal with the line, a charging source of electricity adapted to energize said relay when connection is made with the line, a ringing-key adapted to disconnect said charging source from the line of a called subscriber during the sending of a calling-current, and a supplemental source of electricity adapted to temporarily energize said relay during the time said charging source is disconnected from the line, substantially as described.

18. The combination with a telephone-line, of a connection-terminal normally disconnected therefrom, a relay for connecting said connection-terminal with the line, said relay being adapted to respond to continuous and to non-continuous currents, a charging source of electricity adapted to energize said relay when connection is made with the line, a calling source of electricity adapted to transmit a non-continuous current, a ringing-key for connecting said calling source of electricity with the line of a called subscriber, and for disconnecting said charging source therefrom, said calling source being adapted to temporarily energize said relay during the time said charging source is disconnected from the line, substantially as described.

19. The combination with a telephone-line, of one of the talking-contacts of a spring-jack associated with said line, said contact being normally insulated from the line and from earth, a plug, a cord-circuit, a battery associated with said circuit to raise the potential of said talking-contact above that of the earth while the line is in use and adapted to be included in the metallic circuit of the line to furnish current for talking purposes, and a relay operated from said source to connect said contact with the line during such use, substantially as described.

20. The combination with a metallic telephone-line, of a talking-contact forming a part of a connection-terminal for the line, said contact being normally insulated from the ground, a central source of current associated with the line and adapted to be included in the metallic circuit of the line when a connection exists to furnish current to the substation-transmitters for talking purposes, means for disconnecting said contact from the line when the line is not in use, means operated by current from said source to connect the contact with the line when the line is in use, and testing apparatus to coöperate with said contact to indicate the condition of the line, substantially as described.

21. The combination with a metallic telephone-line, of a plurality of talking-contacts forming portions of connection-terminals for said line, said terminals being arranged at the several sections of a switchboard, said contacts being connected together and normally insulated from ground, means for disconnecting said plurality of contacts from the line when the line is not in use, means to connect said contacts with the line when the line is in use, plug connectors located at the several sections, and a battery associated therewith, and adapted to be included in the metallic talking-circuit to furnish current for talking and for the operation of said connecting means, whereby when a plug at any section is inserted into a jack the potential of all of said contacts is raised, and means for testing the electrical condition of said contacts to ascertain the condition of the line, substantially as described.

22. The combination with a metallic telephone-line, of a plurality of spring-jacks therefor and each having a contact for each limb of said line, a contact in each jack being normally insulated from the line and from ground, a plug and cord-circuit coöperating with said jacks, a relay to connect said contacts with the line when actuated, a supervisory-signal-controlling magnet and a battery associated with said cord-circuit and a switch at the subscriber's station, all coöperating for the purposes of testing and signaling, substantially as described.

23. The combination with a telephone-line having a limb extending to the central office, of a plurality of spring-jacks therefor and each having contact adapted to form a portion of the line-circuit and normally insulated from line and from ground, a plug and cord-circuit coöperating with said jacks, a relay to connect said normally insulated contacts with the limb of the line when actuated, a supervisory-signal-controlling magnet and a battery associated with said cord-circuit, and a switch at the subscriber's station, whereby when a connection is made, said contacts are charged for the purposes of testing, said jacks are placed in operative relation with the line and said supervisory-signal-controlling maguet is placed under the control of the subscriber, substantially as described.

24. The combination with a metallic telephone-line, of a test-terminal therefor, a relay for disconnecting said test-terminal from the telephone-line when the line is not in use, a cord-circuit and a connecting-plug, a source of electricity bridged across said cord-circuit and adapted to send current over the metallic telephone-line to energize said relay and to charge said test-terminal, and testing apparatus adapted to coöperate with said test-terminal to indicate the condition of the line, substantially as described.

25. The combination with a telephone-line, of a test-terminal normally disconnected therefrom, a relay for connecting said test-terminal with the line, testing apparatus, a cord-circuit terminating in a connecting-plug, supervisory signal apparatus associated with the cord-circuit, a source of electricity also associated with the cord-circuit, and means for closing the circuit of said source over the telephone-line to operate the said supervisory apparatus and through said relay when connection is made with the line, said relay-circuit including one of the main terminals of the connecting-plug and a line-contact of the telephone-line with suitable return, substantially as described.

26. The combination with a telephone-line and a connection-terminal therefor normally not in operative relation with the line, of a connecting-plug and cord-circuit to coöperate with said line, a supervisory-signal-controlling magnet and a battery associated with said cord-circuit, a telephone-transmitter and a switch at the subscriber's station, and means controlled by the insertion of the plug into the jack for placing the jack in operative relation with the line by current flowing over a path including a portion of the talking-circuit, whereby talking-current is furnished to said transmitter and said magnet is placed under the control of the subscriber, substantially as described.

27. The combination with a telephone-line, and a connection-terminal therefor normally not in operative relation with said line, of a connecting-plug and cord-circuit adapted to coöperate with said line, a supervisory-signal-controlling magnet and a battery associated with said cord-circuit, a switch at the subscriber's station, and means including a contact connected with the talking-circuit controlled by the insertion of the plug into the jack for placing said jack in operative relation with the line, whereby said signal-controlling magnet is placed under the control of the subscriber, substantially as described.

28. The combination with a metallic telephone-line adapted to be included in a talking-circuit, of a line-signal and a cut-off relay for the line, a cord-circuit, a battery associated with the cord-circuit, and means for closing circuit through said relay over a portion of both sides of the talking-circuit when connection is made with the line to render the line-signal inoperative, substantially as described.

29. The combination with a metallic telephone-line adapted to be included in a talking-circuit, of a line-signal and a cut-off relay for the line, a battery, and means for closing circuit from said battery through said relay over a portion of both sides of the talking-circuit, including a portion of the telephone line and the cord circuit, substantially as described.

30. The combination with a telephone-line and a connection-terminal in the form of a spring-jack normally not in operative relation with the line, of a cord-circuit and a connecting-plug, a central source of current associated with said line and circuit to furnish talking-current to the substations, and means including said source of current actuated by the insertion of said plug in the jack and by current flowing over a part of the talking-circuit for placing said jack in operative relation with said line, substantially as described.

31. The combination with a telephone-line and a connection-terminal in the form of a spring-jack normally not in operative relation with said line, of a cord-circuit and connecting-plug, supervisory signaling apparatus associated with said circuit, a central source of current associated with said line and circuit to operate said supervisory apparatus, and a relay adapted to be energized from said source over a path including a portion of the talking-circuit to place said jack in operative relation with the line when said plug is inserted in said jack, substantially as described.

32. The combination with a telephone-line and a connection-terminal in the form of a spring-jack, of a connecting-plug and a cord-circuit, a central source of current associated with said line and circuit to furnish current for talking purposes, supervisory signal apparatus associated with the cord-circuit and operated from said source of current, and a relay actuated from said source by the insertion of said plug into and its withdrawal from said jack for controlling the operative relation of said jack with said line, said relay being actuated by current flowing over a portion of a strand of the cord-circuit, a talking-contact of the plug and jack and a portion of the telephone-line, substantially as described.

33. In a telephone system, a metallic-circuit line, a connection-terminal in the form of a spring-jack normally not in operative relation with said line, a connecting-plug and a cord-circuit, a signaling device normally in operative relation with said line, a central source of current and supervisory signaling apparatus associated with said line and cord-circuit, said source being adapted to furnish current for the operation of said apparatus and for talking purposes, and a relay actuated from said source over a portion of the talking-circuit when said plug is inserted in said jack to place said signaling device in inoperative relation with said line and said jack in operative relation with said line, substantially as described.

34. The combination with a telephone-line having a limb extending to the central station, of a line-contact for said limb normally disconnected therefrom, a cord-circuit and connecting-plug, supervisory signaling apparatus connected with said circuit, a central source of current associated

with said line and circuit to furnish current for talking purposes and for the operation of said supervisory apparatus, and means actuated over a portion of the talking-circuit for automatically connecting said line-contact with said limb when the line is in use and for disconnecting the same therefrom when the line is not in use, substantially as described.

35. The combination with a telephone-line having a limb extending to the central station, of a signaling device normally connected with said limb, a line-contact for said limb normally disconnected therefrom, a cord-circuit and connecting-plug, supervisory signaling apparatus associated with said cord-circuit, a central battery to furnish current for talking purposes and for the operation of said apparatus, and a relay energized from said battery and connected directly to the talking-circuit and adapted to disconnect said limb from said signaling device and to connect the same with the line-contact when a connection is established with the line, substantially as described.

36. The combination with a telephone-line having a limb extending to the central station, of a spring or moving part with which said limb connects at the central office, a signaling device connected with said spring or part in its normal position, a line-contact for said limb, a cord-circuit and connecting-plug, a central battery associated with the said line-circuit, supervisory signals also associated with the circuit, said battery being adapted to furnish current to the substations for talking purposes and for operating said supervisory signals, and a relay also energized from said battery over a circuit including a portion of one side of the talking-circuit and adapted to disconnect said spring or part from the signaling device and to connect it with the line-contact when a connection is established with the line, substantially as described.

12,082. BOTTLE-SEAL. EDWARD D. SCHMITT, Baltimore, Md., assignor, by mesne assignments, to the Universal Seal and Stopper Company, Camden, N. J. Filed June 14, 1902. Serial No. 111,795. Original No. 685,236, dated Oct. 22, 1901. (Division A.)

Claim.—1. In a bottle-seal, the combination with a bottle formed with a shoulder in its neck and near the mouth thereof and a shoulder below the first-mentioned shoulder, of a sealing member adapted to make contact with the lower shoulder, a spring-metal securing member formed with inclined shoulders thereon to engage the upper shoulder in the bottle-neck and a portion adapted to bear upon the sealing member, and means for locking the shoulders of the securing member in contact with the shoulder of the bottle-neck, substantially as described.

2. In a bottle-seal, the combination with a bottle formed with a shoulder in its neck near the mouth thereof and a shoulder below the first-mentioned shoulder, of a sealing member adapted to make contact with the lower shoulder, a spring-metal securing member formed with inclined shoulders thereon to engage the upper shoulder in the bottle-neck and a portion adapted to bear upon the sealing member and also having arms extending above the bottle-mouth, a tongue secured to one of said arms and adapted to engage the opposite arm to lock the arms apart, substantially as described.

3. In a bottle-seal, the combination with a bottle having an inclined shoulder in the neck thereof and a shoulder below said inclined shoulder, of a sealing member adapted to make sealing contact with the lower shoulder, a spring-metal securing member formed with inclined shoulders thereon to engage the inclined shoulder in the bottle-neck and a portion adapted to bear upon the sealing member and also having arms extending above the bottle-mouth for the purpose set forth, and means for locking said arms apart, substantially as described.

4. In a bottle-seal, the combination with a bottle formed with an inclined shoulder in the neck thereof and a shoulder below said inclined shoulder, of a sealing member adapted to make sealing contact with the lower shoulder, a spring-metal securing member formed with inclined shoulders thereon to engage the inclined shoulder in the bottle-neck and a portion adapted to bear upon the sealing member, and also having arms extending above the bottle-mouth, a tongue hinged or otherwise secured to one of said arms and adapted to engage the opposite arm to lock said arms apart, substantially as described.

5. In a bottle-seal, the combination with a bottle formed with an inclined shoulder in the neck thereof and a shoulder below said first-mentioned shoulder, of a sealing member adapted to make sealing contact with the lower shoulder, a spring-metal securing member formed with shoulders thereon to engage the upper inclined shoulder in the bottle-neck and a portion adapted to bear upon the sealing member and also having arms extending above the bottle-mouth, and means for locking the shoulders of the securing member in contact with the upper shoulder of the bottle-neck, substantially as described.

6. In a bottle-seal, the combination with a bottle having the inner wall of its neck formed with a sealing-seat, and with a shoulder above the sealing-seat, of a sealing member, a securing member adapted to bear upon the sealing member and to engage the shoulder, and means whereby the securing member is locked in engagement with said shoulder and against accidental disengagement, substantially as set forth.

7. In a bottle-seal, the combination with a bottle having the inner wall of its neck formed with a sealing-seat and with a shoulder above the sealing-seat, of a sealing member, a securing member adapted to bear upon the sealing member and to engage the shoulder, said securing member being provided with arms extending outside the bottle-mouth, and a tongue loosely attached to one of said arms and adapted to engage the opposite arm, whereby the securing member is locked in engagement with said shoulder against accidental disengagement.

8. In a bottle-seal, the combination with a bottle having the inner wall of its neck formed with a sealing-seat and a shoulder above the sealing-seat, of a sealing member, a securing member adapted to bear upon the sealing member and to engage the shoulder, and means located above said shoulder whereby the arms of the securing member are locked in engagement with said shoulder.

12,088. BOTTLE-SEAL. EDWARD D. SCHMITT, Baltimore, Md., assignor, by mesne assignments, to the Universal Seal and Stopper Company, Camden, N. J. Filed June 14, 1902. Serial No. 111,796. Original No. 685,236, dated Oct. 22, 1901. (Division B.)

Claim.—1. A bottle-seal comprising a sealing member, a securing member formed with engaging arms, and means for locking said arms.

2. An article of manufacture, a sealing device comprising arms formed with engaging shoulders thereon, a base secured to said arms, and means for locking the arms apart.

3. An article of manufacture, a sealing device comprising arms formed with engaging shoulders thereon, and terminals above the shoulders, a base secured to said arms, and means for locking the terminals and arms apart, substantially as described.

4. A bottle-seal comprising arms formed with engaging shoulders thereon, and terminals above the shoulders, a base secured to said arms and carrying a sealing member, and means for locking the terminals and arms apart, substantially as described.

5. An article of manufacture, a bottle-seal comprising spring-arms each formed with an engaging shoulder and a terminal above the shoulder, a base, a tongue attached to the terminal of one arm and adapted to engage the terminal of the opposite arm for locking purposes, substantially as described.

6. An article of manufacture, a bottle-seal comprising oppositely-disposed spring-arms, each formed with an engaging shoulder, and a terminal above the shoulder, a base, a compressible sealing member secured to the base-piece, a tongue loosely attached to the terminal of one arm and adapted to engage the terminal of the opposite arm for locking purposes, substantially as described.

7. An article of manufacture, a bottle-seal comprising oppositely-disposed spring-arms, each formed with an inclined engaging shoulder, and a terminal above the shoulder, a base, the terminal of one arm being provided with a depression, a compressible sealing member secured to the base-piece, a tongue having one end attached to the terminal of one arm, and having the other end adapted to enter the depression in the opposite terminal to lock the arms apart, substantially as described.

8. An article of manufacture, a bottle-seal comprising arms formed with engaging shoulders thereon, a base secured to said arms and carrying a compressible sealing member, and means for locking the arms apart, substantially as described.

9. A bottle-seal comprising spring-arms formed with engaging shoulders thereon, a base secured to said arms and carrying a compressible sealing member, and means for locking the arms apart, substantially as described.

10. A bottle-seal comprising oppositely-disposed spring-arms formed with engaging shoulders thereon, a base secured to said arms and carrying a compressible sealing member, and means located above the shoulders for locking the arms apart, substantially as described.

11. A bottle-seal comprising a sealing member, a securing member formed with engaging arms, and means carried by said arms for locking the securing member.

DESIGNS.

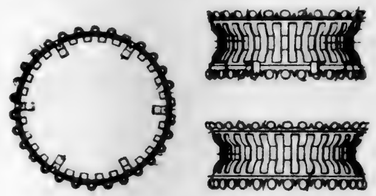
36,074. HANDLE FOR BUTTONERS. MATILDA A. HILL, South Fallsburg, N. Y. Filed June 23, 1901. Serial No. 65,701. Term of patent 3½ years.

Claim.—The ornamental design for a handle for buttoners, as herein shown and described.

36,075. SIDE FRAME FOR CHATELAINE-BAGS. LOUIS WOLF, New York, N. Y. Filed June 4, 1902. Serial No. 110,842. Term of patent 7 years.

Claim.—The ornamental design for a side frame for chatelaine-bags herein shown and described.

36,076. CANOPY FOR LAMP-CHIMNEYS. AARON P. STOKES, Owego, N. Y. Filed Jan. 10, 1902. Serial No. 88,237. Term of patent 7 years.



Claim.—The ornamental design for a canopy for lamp-chimneys described and shown.

36,077. GAS-STOVE FRONT. EMANUEL B. ADLER, Pittsburg, Pa., assignor to Henry Adler, Pittsburg, Pa. Filed Aug. 9, 1902. Serial No. 119,142. Term of patent 7 years.

Claim.—The ornamental design for a gas-stove front, substantially as herein shown and described.

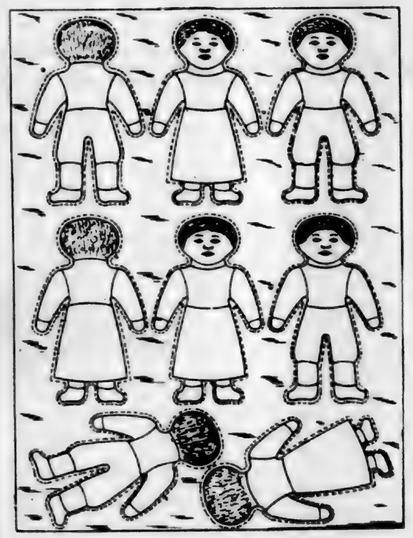
36,078. SOAP. CHARLES A. CRARY, Huntington, W. Va., assignor to Enterprise Soap Works, Nashville, Tenn., a Corporation of Tennessee. Filed May 3, 1902. Serial No. 105,855. Term of patent 14 years.

Claim.—The ornamental design for a cake of soap, substantially as herein shown and described.

36,079. BRAID. MAX MITTENDORFF, New York, N. Y., assignor to Sutro Brothers Braid Company, New York, N. Y., a Corporation of New York. Filed July 31, 1902. Serial No. 117,908. Term of patent 14 years.

Claim.—The ornamental design for a braid, substantially as herein shown and described.

36,080. FABRIC. ADOLF PFANNKUCH, Brooklyn, N. Y. Filed July 24, 1902. Serial No. 116,679. Term of patent 3½ years.



Claim.—The ornamental design for a fabric, substantially as herein shown and described.

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF

UNITED STATES COURTS IN PATENT CASES.

COMMISSIONER'S DECISIONS.

EX PARTE COLLINS.

Decided September 3, 1902.

1. ATTORNEYS—PROTEST AGAINST REVOCATION OF POWER.

Where the attorneys appointed by the inventor protest against the revocation of their power by him on the ground that they represent an assignee and the only evidence presented that there has been an assignment consists of *ex parte* affidavits, *Held* that the protest will be dismissed.

2. SAME—REVOCATION OF POWER BY APPLICANT—ASSIGNMENT.

Where the applicant appoints attorneys in the case, *Held* that he may revoke their power even after an assignment of the invention.

ON protest.

APPARATUS FOR ROASTING ORES.

Application of William F. Collins filed April 16, 1902, No. 103,156.

ALLEN, *Commissioner:*

This is a protest by Crosby and Gregory against the revocation of their power of attorney in the above-entitled case.

The protestants claim to represent an alleged assignee, the Boston Mineral Reduction Company, although the records show that they were originally appointed attorneys in the case by the applicant. The Boston Mineral Reduction Company has not joined in the protest, and no assignment to that company has been recorded in this Office. Certain affidavits have been filed alleging that such an assignment was executed and was left with one of the protestants' employees, but subsequently came into the possession of the inventor, who refuses to part with it. Notwithstanding the allegation as to the signing of the assignment, there is nothing to show that the instrument was delivered to the assignee or that the contract of sale was complete. This Office, furthermore, has no machinery for investigating such questions and has no jurisdiction to render a binding decision as to the validity of the assignment. It has been repeatedly announced that such questions must be left to the courts for determination.

Even if it could be conceded that the alleged assignment to the Boston Mineral Reduction Company is valid and in full force it would be necessary to dismiss this protest. The protestants do not claim to have an interest in the invention, and the inventor having given them a power of attorney is at liberty to revoke it. It is true that an assignee of the entire interest might assert his right to prosecute the case to the exclusion of the inventor and reappoint the same attorneys; but until the assignee asserts that right the inventor alone may control the appointment of the attorney and the revocation of his power. (*Ex parte Anderson*, 62 O. G., 449.)

The protest is dismissed.

EX PARTE NAEF.

Decided September 5, 1902.

1. ABANDONMENT OF APPLICATION—ACTION SUFFICIENT TO SAVE CASE.

Where the Examiner requires division between process and apparatus claims and between claims to different species of the apparatus without mentioning the particular claims by number, and the applicant amends by canceling the process claims and asks for reconsideration and a specific statement as to the apparatus claims, *Held* that his action is proper and saves the case from abandonment.

2. ACTIONS BY APPLICANT—SUFFICIENCY—PRACTICE.

An applicant may accept the ruling of the Office as to some of its requirements and at the same time controvert the ruling as to others, and when he does so, treating all requirements, his action cannot be objected to as insufficient.

ON petition.

TREATING MATERIALS SUCH AS FUEL.

Application of Paul Naef filed April 12, 1901, No. 55,480.

Mr. James L. Norris for the applicant.

ALLEN, *Commissioner:*

This is a petition from the Examiner's action holding that the above-entitled application is abandoned through a lack of proper prosecution.

In his first letter in the case, dated May 17, 1901, the Examiner required division between claims to the process and claims to the apparatus and between claims drawn to different species of the apparatus. In this letter the Examiner did not by grouping the claims indicate the lines upon which the apparatus claims were to be divided. In reply the applicant filed an amendment on May 13, 1902, within the time allowed by law, canceling the process claims and amending other claims. In that communication the applicant argued that all of his claims related to one apparatus and that he was entitled to an action upon the merits or "to a communication from the Examiner setting forth specifically the lines on which the Examiner required the different apparatus claims to be separated." The Examiner did not regard this as such

proper action as the condition of the case required and for that reason notified the applicant that the case is abandoned.

While it is true that the Office practice does not encourage piecemeal action upon cases, but, on the contrary, requires action as to all requirements at one time, it is also true that an applicant may accept the ruling of the Office as to some of its requirements and at the same time controvert the ruling as to others. This seems to be what the applicant has done in this case, and it is not piecemeal action. A party is under the plain provisions of the statute and rules entitled to a reconsideration of the first action upon a proper request therefor, and the fact that he accepts part of that action as correct does not deprive him of the right to a reconsideration of the balance.

The case of *ex parte Bassett*, (98 O. G., 2174,) cited by the Examiner, does not furnish authority for the ruling that the present case is abandoned. In that case the circumstances were such as to show that the applicant's action was a mere pretext to keep the case pending in the Office, and such is not the situation here. It is true, as stated by the Examiner, that it is well settled that a party will not be permitted to claim two species of his invention in one application, and a party familiar with the Office practice could not expect to advance the prosecution of the case by a request for reconsideration of a ruling upon that question of practice. The present applicant, however, has not disputed the general proposition that division should be required between different species. There may well be a difference of opinion as to whether certain claims are limited to one species or to another or are broad enough to cover both, and the applicant is clearly within his rights in asking that the Examiner indicate clearly the lines of division before he attempts to comply with the requirement. This is what he has done.

The petition is granted.

EX PARTE BALL.

Decided September 4, 1902.

1. SPECIFICATION — PRIVATE IDENTIFYING-MARKS — "CASE NO. 2332."

An applicant will not be permitted to include in the specification private identifying-marks which have no meaning to any one else, such as "Case No. 2332."

2. SAME—IRRELEVANT MATTER.

The object of the specification is to describe the invention, and it should not include matter which does not assist in accomplishing that result and which, if considered at all, may lead to confusion.

ON petition.

STEERING MECHANISMS FOR VEHICLES.

Application of Augustus A. Ball, Jr., filed January 24, 1902, No. 91,012.

Mr. Albert G. Davis for the applicant.

ALLEN, *Commissioner:*

This is a petition from the action of the Primary Examiner requiring the cancellation of the words "Case No. 2332" appearing in the specification.

The words and figures objected to are used by the attorney as his private identifying-marks, and they have no meaning to any one else, except possibly the assignee owning the invention and the patent to be issued. They clearly do not assist in disclosing the invention to the public, and they may lead to confusion by inducing the public to assume that they have reference to some other case. If they are permitted to appear in the patent, one reading it would naturally assume that they had some significance. The object of the specification is to describe the invention, and it should not include matter which does not assist in accomplishing that result and which, if considered at all, may lead to confusion.

It is said that the Office has permitted such marks to appear in some patents which have been granted; but no good reason is seen for the practice, and it should not be continued.

There is no necessity for private identifying-marks in applications filed in this Office, since they are given official numbers which serve for identification. If the applicant in his system of bookkeeping wishes to give them different identifying-numbers, there are many unobjectionable ways of doing so; but he should not be permitted to include them in the printed specification, which is intended merely to disclose the invention to the public.

The petition is denied.

EX PARTE SCHMIDT.

Decided September 5, 1902.

1. AMENDMENT AFTER FINAL REJECTION—REASONS FOR DELAY.

Where after a final rejection, which is regularly and properly given, the applicant wishes to amend and alleges that he did not before properly understand the invention, *Held* that he has not shown good and sufficient reasons why the amendment was not sooner presented and that it should be refused admission.

2. DIVISION—PROCESS AND PRODUCT.

Held that division was properly required between a claim for the process of making a box and a claim for the box where the box is not necessarily made by the process.

ON petition.

BOX AND METHOD OF MAKING SAME.

Application of Joseph Schmidt, Jr., filed October 4, 1900, No. 32,044.

Messrs. L. B. Coupland & Co. and *Mr. W. A. Bartlett* for the applicant.

ALLEN, *Commissioner:*

This is a petition from the action of the Primary Examiner refusing to enter an amendment presented on May 29, 1902, and from his action in requiring division between claims to the process and a claim to the article.

On July 9, 1901, the three claims in the case were finally rejected by the Examiner and the applicant was notified that the third claim, covering the article, was for a different invention from the others, covering the process of making the article. The applicant then presented the amendment of May 29, 1902, substituting four claims for those finally rejected, three of those claims being drawn to the process and one to the article. The final rejection of July 9, 1901, was proper and in order, and the only excuse given why the present amended claims

were not presented prior to the final rejection is that the attorney did not then properly understand the invention. This excuse may be given in any case, since the attorney will not wish to amend the claims unless new light has reached him. It cannot be accepted as the showing of good and sufficient reasons why the amendment was not earlier presented, and therefore under the rule the applicant is not entitled now to amend this application.

In regard to the question of division it is found that the article claimed is not necessarily made by the process claimed. That article claim is broad, covering the box disclosed without regard to the process by which it is made, and therefore in it the applicant has departed from the invention of the process claims. The box is capable of independent existence and is a separate invention from the process. Division was properly required.

The Examiner states that the three proposed process claims are, in his opinion, patentable and that he would admit the amendment if it were not for the presence of the article claim. If those claims alone are presented as substitutes for those in the application, they will be entered.

The petition is denied.

EX PARTE TURNER.

Decided September 5, 1902.

1. RENEWAL OF FORFEITED APPLICATION—ALLEGED ASSIGNEE.

Where an alleged assignee asks to be allowed to renew a forfeited application and files a copy of the alleged assignment saying that the original is lost and the inventor protests saying that no valid assignment has been made, *Held* that the request must be denied.

2. ASSIGNMENTS—DUTY OF OFFICE MINISTERIAL.

The Office cannot undertake to adjudicate the rights of parties on disputed questions of fact relating to assignments, since it acts in a ministerial capacity in such matters.

ON petition.

SUSPENDED-CAR TRANSFERS.

Application of Claude A. P. Turner filed April 22, 1901, No. 56,835.

Messrs. Paul & Hawley for the applicant.

ALLEN, *Commissioner:*

This is a petition by the American Bridge Company, an alleged assignee, asking that it be permitted to renew the above-entitled forfeited application.

There is no assignment on record in this Office transferring the invention to the American Bridge Company, although it is stated on behalf of the petitioner that such an assignment was executed. It is alleged that the original assignment has been mislaid or lost, and a copy of it, certified to by the notary before whom it was executed, has been filed. The applicant has filed a protest against the renewal of the application by the American Bridge Company and says that the alleged assignment is not valid, since the conditions have not been complied with by the assignee.

This Office has no jurisdiction to investigate and decide disputed questions of title, since those matters are left to the courts. It acts in a ministerial capacity in regard to assignments and must follow the record without attempting to adjudicate the rights of the parties on disputed questions of fact.

In so far as the records of this Office show the American Bridge Company has no interest in this application, and therefore it is not entitled to renew it.

The petition is denied.

EX PARTE BISCHOFF.

Decided September 6, 1902.

EXAMINATION—MAKING CASES SPECIAL.

Applications must be examined in regular order, and the Office cannot give one case precedence over others because of the applicant's business arrangements which are dependent upon a speedy allowance of the patent.

ON petition.

PROCESSES FOR MAKING TUBING.

Application of Frederick F. Bischoff filed April 9, 1902, No. 102,024.

Mr. R. W. Lotz and *Messrs. H. C. Evert & Co.* for the applicant.

ALLEN, *Commissioner:*

This is a petition asking that the above-entitled application be made special in the order of examinations.

It is alleged in the petition that certain business arrangements of the applicant are dependent upon a speedy allowance of this application and that if action thereon is postponed to await its regular turn among the cases pending before the Examiner great hardship will result to the applicant. The petitioner states his belief that the claims presented in an amendment filed by him are allowable; but the Examiner says that a further examination will be necessary before that question can be determined. To make this case special and order that examination be made at this time would result in delays in the actions upon other cases pending before the Examiner.

The rules require that applications be examined in regular order, (Rules 23 and 63,) except under certain conditions, which are not present in this case. The Office cannot take up cases in the order of their importance to the applicants, but must follow the rules.

The petition is denied.

EX PARTE STAR LOTION REMEDY COMPANY.

Decided September 6, 1902.

1. TRADE-MARKS—FACSIMILE—DESCRIPTIVE WORDS.

Where the facsimile of a trade-mark includes certain arbitrary symbols and the representation of the sea having printed thereon the word "Lotion," *Held* that the word "Lotion" being descriptive forms no part of the mark and should be removed.

2. SAME—DRAWINGS—DESCRIPTIVE WORDS NOT INCLUDED.

A descriptive word cannot be made a part of a trade-mark by association with arbitrary symbols in the ordinary way, and therefore the drawing of the application should disclose only the arbitrary symbols.

3. SAME—SAME—PARTS INSEPARABLE.

A descriptive word should not be retained in the drawing of a trade-mark application unless its parts are so interwoven with the arbitrary parts of the mark as to become an inseparable part thereof.

APPEAL from Examiner of Trade-Marks.

TRADE-MARK FOR TOPICAL REMEDIES.

Application for registration filed May 3, 1902, No. 65,723.

Mr. Emil Starek for the applicant.

ALLEN, *Commissioner:*

This is an appeal from the action of the Examiner of Trade-Marks refusing to register the mark claimed for the reason that the facsimile filed includes the descriptive word "Lotion."

The mark was described in the original application as follows:

Our trade-mark consists of the representation of a bit of sea with choppy waves, with the sun partially submerged below the horizon, the whole inclosed by a circular border. At either end of the horizon is a sail-boat. The sun has emanating from its surface, two sets of rays, a long set alternating with a short set, each ray terminating in a star, the latter being disposed in two distinct semicircles. Over the waves and conforming to the contour of the sea-surface is the darkened outline of the word "Lotion." Across the body of the sun is the word "Star."

The Examiner said in his letter of June 5, 1902:

The word "Lotion" is descriptive and cannot be included in the description of the mark itself or in the illustration thereof. Manifestly descriptive words cannot form a part of a mark.

The word "Lotion" is undoubtedly descriptive of the goods upon which the mark is used, and it is well settled that a descriptive word cannot constitute a valid trade-mark. It is furthermore settled that such a word cannot be made a part of a trade-mark by association in the usual way with arbitrary symbols. (*Ex parte Tabor*, 96 O. G., 1036; *ex parte Holophane Glass Co.*, 100 O. G., 450.)

In most cases the arbitrary symbols alone constitute the mark and should be alone disclosed in the drawing; but, as indicated in *ex parte Tabor*, it is possible to produce a descriptive word in such a way and associate it with the arbitrary symbols in such a manner that it forms an inseparable part of the arbitrary mark. In such case the word cannot be omitted without changing the appearance of the mark as a whole, since it constitutes an element of that mark. To have such effect, however, there must be something more than merely printing the word, on or in connection with the arbitrary symbols, as any one would have the right to print it. Its parts must be so interwoven with the arbitrary parts of the mark as to become an inseparable part thereof. It is believed that the word "Lotion" as it appears in this case is not a part of the mark and should not be permitted to remain in the facsimile.

The decision of the Examiner of Trade-Marks is affirmed.

EX PARTE BADGLEY.

Decided September 8, 1902.

ASSIGNEE OF PART INTEREST—RIGHT TO PROSECUTE CASE—NOTICE TO OTHER PARTIES.

A petition asking that one of two joint owners be permitted to prosecute the application without the consent of the other will not be granted without serving a copy of the petition upon that other owner and giving him an opportunity to oppose it.

ON petition.

MANUFACTURE OF COMPOSITION PIPE OR TUBING FOR GAS, WATER, ETC.

Application of Eugene F. Badgley filed July 12, 1893, No. 480,321.

ALLEN, *Commissioner:*

This is a petition by Helen Henry, assignee of two-thirds interest in the invention, asking that she be permitted to prosecute the above-entitled application.

The records show that the inventor died after appointing an attorney to prosecute the case for him. Helen Henry was then appointed administratrix, and a one-half interest in the invention was transferred to H. P. Badgley and the other half was transferred to I. B. Hampton. Helen Henry was then discharged as administratrix by the court and the estate of the deceased inventor was declared closed. I. B. Hampton thereupon transferred her entire interest in the invention to Helen Henry and H. P. Badgley transferred to her one-third of his interest.

The inventor being dead and the administratrix having been discharged, there is no one to prosecute this application save the assignees. This petitioner makes affidavit that she has attempted to secure from H. P. Badgley a power of attorney to prosecute the case, but that he refuses to give her such power. There is nothing to show that notice of this petition has been served upon H. P. Badgley, and the notice of hearing sent to him by this Office was returned undelivered.

While the facts stated by the petitioner might be sufficient to warrant granting her request in the absence of a showing of reasons why it should not be granted, it is believed that Badgley should be served with a copy of the petition and given an opportunity to oppose the request if he so desires.

The present petition is dismissed without prejudice to the right of renewal upon proof of service of a copy upon the party H. P. Badgley.

The Official Gazette.

THE OFFICIAL GAZETTE is published every Tuesday, simultaneously with the weekly issue of patents. From January 1, 1873, (the commencement of its publication,) to June 30, 1893, it was published and bound in semi-annual volumes; since July 1, 1893, in quarterly volumes. Terms: To subscribers within the United States, Canada, and Mexico, $5 per annum; to foreign subscribers, $10; single copies, 10 cents; if mailed to foreign countries 10 cents additional for postage; bound semi-annual volumes, (prior to June 30, 1893,) full sheep, $4 per volume; bound quarterly volumes, (subsequent to July 1, 1893,) full sheep, $2.75 per volume. *Payment in advance.* No subscription will be received for less than three months. All orders should be addressed to "The Commissioner of Patents, Washington, D. C."

Punctuation and Amendments.

Attention is called to Order 789, dated November 26, 1892, which is as follows:

It is hereby directed that in the printing of claims of applications for patents the punctuation of the claims as made by applicants be strictly followed, and that the punctuation of the specification made by applicants be not departed from except to cure a manifest absurdity.

This order is still in force.

Examiners are prohibited from making any change in the claims or specification of an application without the consent of applicants or their attorneys; but when amendment becomes necessary the Office will duly advise, by letter, the applicant or his representative before passing a case to issue.

APPEAL from Examiner of Trade-Marks.

TRADE-MARK FOR TOPICAL REMEDIES.

Application for registration filed May 3, 1902, No. 65,723.

Mr. Emil Starek for the applicant.

ALLEN, *Commissioner:*

This is an appeal from the action of the Examiner of Trade-Marks refusing to register the mark claimed for the reason that the facsimile filed includes the descriptive word "Lotion."

The mark was described in the original application as follows:

Our trade-mark consists of the representation of a bit of sea with choppy waves, with the sun partially submerged below the horizon, the whole inclosed by a circular border. At either end of the horizon is a sail-boat. The sun has emanating from its surface, two sets of rays, a long set alternating with a short set, each ray terminating in a star, the latter being disposed in two distinct semicircles. Over the waves and conforming to the contour of the sea-surface is the darkened outline of the word "Lotion." Across the body of the sun is the word "Star."

The Examiner said in his letter of June 5, 1902:

The word "Lotion" is descriptive and cannot be included in the description of the mark itself or in the illustration thereof. Manifestly descriptive words cannot form a part of a mark.

The word "Lotion" is undoubtedly descriptive of the goods upon which the mark is used, and it is well settled that a descriptive word cannot constitute a valid trade-mark. It is furthermore settled that such a word cannot be made a part of a trade-mark by association in the usual way with arbitrary symbols. (*Ex parte Tabor*, 96 O. G., 1036; *ex parte Holophane Glass Co.*, 100 O. G., 450.)

In most cases the arbitrary symbols alone constitute the mark and should be alone disclosed in the drawing; but, as indicated in *ex parte Tabor*, it is possible to produce a descriptive word in such a way and associate it with the arbitrary symbols in such a manner that it forms an inseparable part of the arbitrary mark. In such case the word cannot be omitted without changing the appearance of the mark as a whole, since it constitutes an element of that mark. To have such effect, however, there must be something more than merely printing the word on or in connection with the arbitrary symbols, as any one would have the right to print it. Its parts must be so interwoven with the arbitrary parts of the mark as to become an inseparable part thereof. It is believed that the word "Lotion" as it appears in this case is not a part of the mark and should not be permitted to remain in the facsimile.

The decision of the Examiner of Trade-Marks is affirmed.

EX PARTE BADGLEY.

Decided September 8, 1902.

ASSIGNEE OF PART INTEREST—RIGHT TO PROSECUTE CASE—NOTICE TO OTHER PARTIES.

A petition asking that one of two joint owners be permitted to prosecute the application without the consent of the other will not be granted without serving a copy of the petition upon that other owner and giving him an opportunity to oppose it.

ON petition.

MANUFACTURE OF COMPOSITION PIPE OR TUBING FOR GAS, WATER, ETC.

Application of Eugene F. Badgley filed July 12, 1893, No. 480,321.

ALLEN, *Commissioner:*

This is a petition by Helen Henry, assignee of two-thirds interest in the invention, asking that she be permitted to prosecute the above-entitled application.

The records show that the inventor died after appointing an attorney to prosecute the case for him. Helen Henry was then appointed administratrix, and a one-half interest in the invention was transferred to H. P. Badgley and the other half was transferred to I. B. Hampton. Helen Henry was then discharged as administratrix by the court and the estate of the deceased inventor was declared closed. I. B. Hampton thereupon transferred her entire interest in the invention to Helen Henry and H. P. Badgley transferred to her one-third of his interest.

The inventor being dead and the administratrix having been discharged, there is no one to prosecute this application save the assignees. This petitioner makes affidavit that she has attempted to secure from H. P. Badgley a power of attorney to prosecute the case, but that he refuses to give her such power. There is nothing to show that notice of this petition has been served upon H. P. Badgley, and the notice of hearing sent to him by this Office was returned undelivered.

While the facts stated by the petitioner might be sufficient to warrant granting her request in the absence of a showing of reasons why it should not be granted, it is believed that Badgley should be served with a copy of the petition and given an opportunity to oppose the request if he so desires.

The present petition is dismissed without prejudice to the right of renewal upon proof of service of a copy upon the party H. P. Badgley.

Amendments to Allowed Applications.

Hereafter all amendments proposed to allowed applications and all petitions and requests relating thereto shall be filed with the docket clerk, Mr. J. M. Fowler, and transmitted by him to the Primary Examiner for report. If the Examiner shall report favorably to the admission of such amendment, the matter will be laid before the Commissioner for immediate determination. If the Examiner shall report unfavorably, the case will be docketed and will be heard and decided by the Commissioner in regular course, unless good reasons shall appear for immediate action. (Order 699 amended October 15, 1898.)

Renewal of Forfeited Applications.

Attention is called to section 4,897, Revised Statutes, relating to the renewal of allowed applications forfeited through failure to pay the final fee within six months from the date of allowance. The law requires the petition for renewal to be signed by the *inventor, discoverer*, or *assignee* and that the same be filed in this Office within two years after the allowance of the original application. If the inventor be dead, the petition must be signed by the administrator or executor; if insane, by the guardian, conservator, or legal representative. *It will not be accepted if signed by the attorney.* (Form 12, page 64, Rules of Practice, should be used.)

PATENTS

GRANTED SEPTEMBER 23, 1902.

709,456. THREAD-CONTROLLING DEVICE FOR SEWING-MACHINES. Edward H Allen, Elizabeth, N. J., assignor to The Singer Manufacturing Company, a Corporation of New Jersey. Original application filed Sept. 20, 1901, Serial No. 75,667. Divided and this application filed Dec. 4, 1901. Serial No. 84,656. (No model.)

Claim.—1. In a sewing-machine, the combination with upper and lower stitch-forming devices, comprising a needle and a shuttle for forming lock-stitches, and a bobbin-case for said shuttle, of means for drawing up the upper or needle thread in tightening the stitches, a pull-off device for the lower thread, an automatic lower-thread-nipping device comprising a rigid finger and a spring-finger on the said bobbin-case and between which the shuttle-thread passes, and a moving part timed to engage said spring-finger so as to cause said thread-nipping device to hold said shuttle-thread after a stitch has been "set" or tightened and while the said pull-off device is drawing lower thread through the lower tension device for the next stitch.

2. In a sewing-machine, the combination with upper and lower stitch-forming devices, the latter of which comprises a shuttle having a pull-off flange for the lower thread and a bobbin-case having an arm or projection which prevents the said bobbin-case from moving with the shuttle, and which arm or projection is constructed to form a thread-nipping device, a take-up device for tightening the stitches, and means for closing said thread-nipping device after a stitch has been tightened and while thread is being drawn from the bobbin for the next succeeding stitch; whereby after a stitch has been tightened it will remain undisturbed by any subsequent pull on the lower thread.

3. In a sewing machine, the combination with the upper and lower stitch-forming devices the latter of which comprises a shuttle having a pull-off flange for the lower thread and a bobbin-case having an arm or projection which prevents the said bobbin-case from moving with the shuttle, and which arm or projection is constructed to form a thread-nipping device, a take-up device for tightening the stitches, a spring-pressed plunger for closing the said thread-nipping device, a vibrating arm or lever by which the said spring-pressed plunger is carried, and means for operating the said arm or lever.

709,457. MAGAZINE TORPEDO-CANE. James R Allen, Detroit, Mich., assignor, by direct and mesne assignments, to James H. Bovington, Cleveland, Ohio. Filed May 19, 1902. Serial No. 107,919. (No model.)

Claim.—1. In a torpedo-cane, the combination with the cane-body having a bore extending from end to end and carrying at its lower end an exploding device communicating with said bore, of a vertically-sliding magazine-tube in the upper end of said bore closed at the bottom and normally projecting with its upper end through the top of the cane, a spring supporting said tube in said normal position free to be depressed into the bore of the cane by pressing upon the projecting end of said tube, a lateral discharge-orifice at the end of the tube near the bottom, a cavity in the body of the cane adapted to register with the aforesaid orifice when the magazine-tube is depressed and to receive a torpedo from said tube and discharge the same into the bore of the cane and means to charge the magazine-tube with torpedoes.

2. In a torpedo-cane, the combination of a cane-body having a knob at its upper end provided with a central depression and with a bore extending from end to end through said knob and through the entire body of the cane, an exploding device at the lower end of the cane-body and communicating with said bore, a magazine-tube closed at the ends and provided intermediate its length with an inlet-orifice for charging the tube and near its bottom with a lateral discharge-orifice, a coil-spring sleeved upon the tube and slidingly supporting the same in the upper end of the bore, with the upper end of the tube projecting normally into the depression in the knob whereby said tube may be actuated by depressing it with a finger, an orifice in the side of the cane registering with the charging-orifice of the tube when the tube is depressed and a pocket in the cane-body communicating with the bore of the cane below the magazine-tube and adapted to register with the discharge-orifice of said tube while the latter is depressed.

3. In a torpedo-cane the combination with the cane-body provided with a central bore and having a magazine-tube in its upper end for discharging torpedoes into said bore, of an exploding device at the lower end of the cane-body consisting of the spherical casing I formed with nipples *i j*, the former for securing the casing to the end of the cane-body through which the casing communicates with the bore of the cane, a firing-pin slidingly guided in the nipple *j* and projecting with its lower end through said nipple and with its upper end into the bottom of the casing, said upper end formed with a concave seat *m* and a bridge *n* extending crosswise in the casing above the firing-pin and forming an abutment between which and the firing-pin the torpedo is adapted to be exploded, said bridge rounded upon its upper side and adapted to guide a torpedo into the seat of the firing-pin.

709,458. CHECK-PERFORATING MACHINE. Frank Avery, Orin, Wyo. Filed Apr. 19, 1902. Serial No. 103,772. (No model.)

Claim.—1. A pocket check-protector comprising a watch-like casing having a base portion, a revolvable die-support mounted on the base, a plurality of perforating-dies carried by the support, and a protecting lid or cover hinged to the base and serving when closed to cover and protect all of the dies, said lid or cover forming a lever for effecting the depression of said dies.

2. A device of the class specified, comprising a base, a revoluble disk supported thereby, perforating-dies carried by said disk, a cover hinged to the base and forming an actuating-lever for engaging with the dies, said cover being movable to open position to permit the adjustment of the disk and serving when closed to protect all of the dies, and a female die and stripper for coöperation with all of such dies.

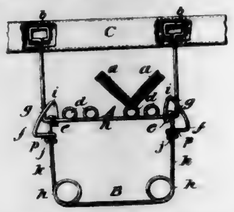
3. A device of the class specified, comprising a base, a revoluble disk supported thereby, a series of perforating-dies supported by said disk and adjustable to operative position by the movement of the disk, and a lid or cover hinged to the base, and movable to open position to permit the adjustment of the dies, said lid having a projecting lug for operative contact with an adjusted die during a closing movement of said lid.

4. A device of the class specified, comprising a base, a revoluble disk supported thereby, a series of perforating-dies carried by the disk, springs tending to hold said dies in elevated position, slotted heads carried by said dies, and a hinged lid or cover having a depending lug for engagement in said slotted heads, the slot in each head being disposed in the plane of movement of the lug.

5. A device of the class specified, comprising a base having a receiving-slot for the material to be cut, a revolable disk supported by the base, a series of perforating-dies carried by the disk, and a hinged lid or cover movable to open position to permit the adjustment of the dies and adapted during closing movement to depress and force a selected die through the material inserted in the slot.

6. A device of the class specified, comprising a base having a check-receiving slot, a revoluble disk, dies carried thereby, springs carried by the base and adapted for engagement in recesses in the disk thereby to hold said disk in an adjusted position, a hinged cover for coöperation with the dies, and a marking device comprising an intereengaging pin and opening for marking the article to be punched at each operative movement of the lid or cover.

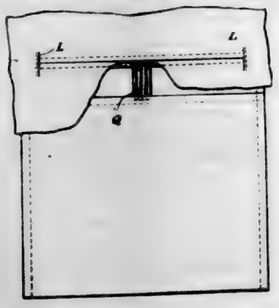
709,459. **SKIRT-ELEVATOR.** CHARLES W. L. BARBER, Colorado Springs, Colo. Filed May 1, 1902. Serial No. 58,359. (No model.)



Claim.—1. A skirt elevator and supporter frame, comprising a cross-bar *n*, having a bar *g* at each end projecting at right angles thereto and having eyes *b*, for attaching to a belt, tapes *a* secured to a bar *n*, a frame B movably connected to the bar *n*, and having brackets *f*, to engage the arms *g*, substantially as shown and described.

2. In an improved skirt elevator and supporter, the combination with wire frame B, movably attached to bar *n*, of frame A, and hinged thereon, provided with spring-eyes A, connected by bar *m*, arms *k*, carrying bracket-catches *p*, so made as to engage arms *g*, of frame A, having bar *n*, provided with eyes *d*, to which are attached adjusting-tapes *a*, substantially as described and for the purposes set forth.

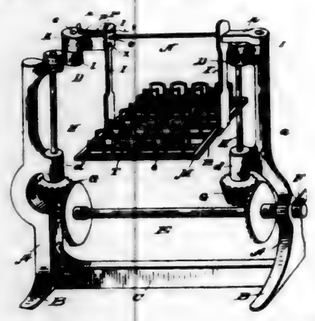
709,460. **POCKET.** REINHOLD BARTELL, Philadelphia, Pa. Filed July 8, 1899. Serial No. 723,182. (No model.)



Claim.—1. In a garment having a pocket-opening, bars comprising a plurality of folds extending across the ends of the openings, said folds being stitched, a pocket-strip, a facing-strip secured thereto, a plait formed in the pocket-strip and means for yieldingly supporting the pocket-strip.

2. In a garment having a pocket-opening, bars at each end of the pocket-opening comprising folds of the material from which the pocket-opening is cut, said folds being stitched substantially as described.

709,461. **ACID-MIXER FOR FACILITATING THE TESTING OF MILK AND CREAM.** MILO D. BEACH, Litchfield, Conn., assignor to the Sharples Company, Chicago, Ill., a Corporation of Nebraska. Filed Feb 16, 1901. Serial No. 47,562. (No model.)



Claim.—1. In a device of the class described the combination with a frame, of a tray supported therein, means on the tray to removably hold a plurality of bottles, said means forming a constrictive engagement about each bottle independently of the others, and means for moving the tray and the bottles in a circle in a horizontal plane.

2. In a device of the class described the combination with an upright frame, of a tray supported therein and adapted to support a plurality of bottles, a series of clamps carried by the tray to form a constrictive engagement about each bottle, whereby the bottles are independently removable and securely held on the tray, means to permit the tray and bottles to be held in a tilted or inverted position, and means for moving the tray and bottles in a circle in a horizontal plane.

3. In a device of the character described, a frame, upright shafts journaled in the frame, crank-arms I secured to the shafts, links K pivoted to the arms I, a tray suspended by the links, yielding clamps secured to the tray to hold the bottles, and means for rotating the upright shafts to move the tray and bottles in a circle in a horizontal plane.

4. In a device of the character described, the combination with a frame having vertical shafts journaled therein, of a tray pivotally suspended within the frame to permit it to be swung vertically and provided with yielding clamps to hold a number of bottles, means for rotating the shafts, adjunctive mechanism between the shafts and the tray for moving the tray and bottles in a circle in a longitudinal plane.

5. In a device of the character described, a frame, a tray suspended within the frame, clasps attached to the tray for holding bottles, means for moving the tray and bottles in a circle in a horizontal plane, and means to permit the bottles to be tilted or inverted and hold them in such tilted or inverted positions, as and for the purposes shown.

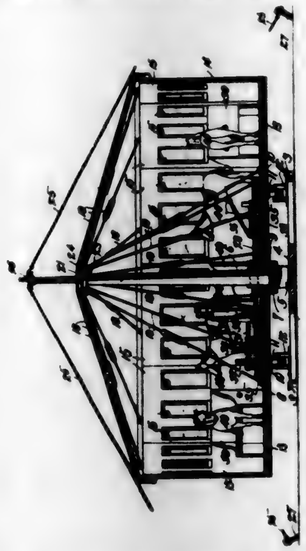
6. In a device of the character described, an upright frame, a tray suspended from the frame, yielding clamps attached to the tray for holding bottles thereon, gearing for moving the tray in a circle in a horizontal plane, and means for tilting or inverting the bottles and holding them in such changed positions, as and for the purposes shown.

7. The combination of an upright frame, upright shafts H, arms I and links K, a tray pivotally suspended from the links K and provided with means to hold the bottles, means on one of the links K to hold the tray in a tilted or inverted position, and means for revolving the tray and bottles in a horizontal plane.

8. The combination of an upright frame, upright shafts H, a tray, crank-and-link connections between the tray and shaft, clamps on the tray for removably holding bottles, means for rotating the shafts to move the tray and bottles in a circle in a horizontal plane, and means for permitting the bottles to be inverted or tilted at an angle, and means for holding them in such changed positions.

9. The combination of the upright frame, shafts E and H, bevel gear G, arms I and links K, hangers suspended from the links K, one of said hangers having holes, a tray attached to the hangers, clamps attached to the tray for holding bottles, and a spring-actuated pin secured to one of the links K and adapted to engage one of the holes in a hanger, all combined as and for the purposes shown.

709,462. **MERRY-GO-ROUND.** EDMUND BOLLINGER, Fostoria, Ohio. Filed Feb. 17, 1902. Serial No. 94,503. (No model.)



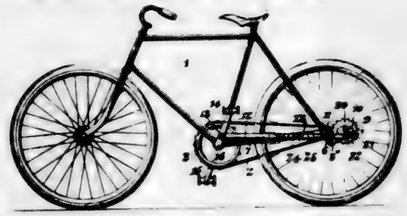
Claim.—1. A merry-go-round comprising a base, a centrally-arranged stationary mast, a rotary platform journaled on the mast and extending outward therefrom, antifriction devices located between the base and the rotary platform at a point remote from the mast and mounted on one of such parts and supporting the said rotary platform, a rack arranged on the rotary platform adjacent to the periphery of the stationary platform, a gear-wheel mounted on the latter and meshing with the rack, and means mounted on the stationary platform for rotating the gear-wheel, substantially as described.

2. A merry-go-round comprising a base, a centrally-arranged stationary mast, a rotary platform journaled on the mast, antifriction devices located between the base and the rotary platform and mounted on one of such parts and supporting the said rotary platform at points beyond the mast, a stationary platform fixed to the mast and arranged directly above and adjacent to the rotary platform and terminating short of the periphery of the same, a curved rack mounted on the rotary platform and located beneath the stationary platform, a gear-wheel extending through the stationary platform and engaging the rack, means mounted on the stationary platform for rotating the gear-wheel, and a brake mounted on the stationary platform and extending through the same and engaging the rotary platform, substantially as described.

3. A merry-go-round comprising a base, a stationary mast, a rotary platform journaled on the mast and extending outward therefrom, antifriction devices located between the rotary platform and the base and supporting the former at points beyond the mast, a stationary platform fixed to the mast directly above the rotary platform and terminating short of the periphery of the same, a vertical wall arranged at the periphery of the rotary platform, guys or braces extending from the upper portion of the mast to the rotary platform and to the upper portions of the vertical wall, the guys or braces which extend through the rotary platform being arranged adjacent to the periphery of the stationary platform, and means mounted on the stationary platform for rotating the other platform, substantially as described.

4. A merry-go-round comprising a base, a stationary mast interlocked with the base, antifriction-wheels mounted on the base at points beyond the mast, a rotary platform journaled on the mast and extending outward therefrom and supported by the antifriction-wheels, a stationary platform located above the rotary platform and terminating short of the periphery thereof, a circular rack mounted on the rotary platform and arranged adjacent to the outer edge of the stationary platform at a point above the antifriction-wheels, a brake extending through the stationary platform and engaging the rotary platform, a vertical wall mounted on the rotary platform, inclined braces extending from the top of the vertical wall to the mast, a cover supported by the inclined braces, a gear-wheel extending through the stationary platform and meshing with the rack, and means for operating the gear-wheel, substantially as described.

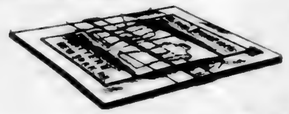
709,463. **CHAINLESS BICYCLE.** FREDERICK BOOTH, Tefft, Ind. Filed Oct. 14, 1901. Serial No. 78,642. (No model.)



Claim.—1. A bicycle having one of its lower frame-bars extended rearward from the rear axle, a driven gear upon the rear hub, a driving-gear mounted on the extension and meshing with the rear of the driven gear, and a lever fulcrumed for reciprocatory movement upon one of the frame-bars and having one end in engagement with the driving-gear and the other end in engagement with one of the pedal-cranks.

2. In a bicycle, the combination with the frame thereof, the rear wheel and the pedal-crank shaft, of a driven gear carried by the rear hub, the adjacent lower frame-bar being extended downwardly below and in rear of the driven gear, thence extended inwardly beyond the gear, and then projected rearwardly, a driving-gear mounted upon the outer side of the rear end of the extended frame portion and in mesh with the driven gear, and a connecting-rod between the driving-gear and the adjacent pedal-crank.

709,464. **DRESS-PATTERN SEAL.** JOHN BROACH and GEORGE W. GODDRICH, New York, N. Y., assignors to the Independent Pattern Company, New York, N. Y., a Corporation of New York. Filed June 17, 1902. Serial No. 112,044. (No model.)



Claim.—1. In a paper dress-pattern the combination with a pattern formed of thin soft tissue-paper adapted to readily absorb glue or other adhesive and folded to form a package adapted to open along one of its edges, and a severable sealing-band glued to the soft tissue-paper forming said package and extending across the open or free edges of the folded parts thereof, whereby the package will be held closed until the sealing-band be broken.

2. In a paper dress-pattern, the combination with a pattern formed of thin soft tissue-paper adapted to readily absorb glue or other adhesive and folded to form a package, of a severable sealing-band extending across the free or open edges of the parts of the said package and being pasted or glued to the package, and a guard-sheet glued to the package outside of the sealing-band and extending over said band at its point of attachment to the pattern-package, for the purpose set forth.

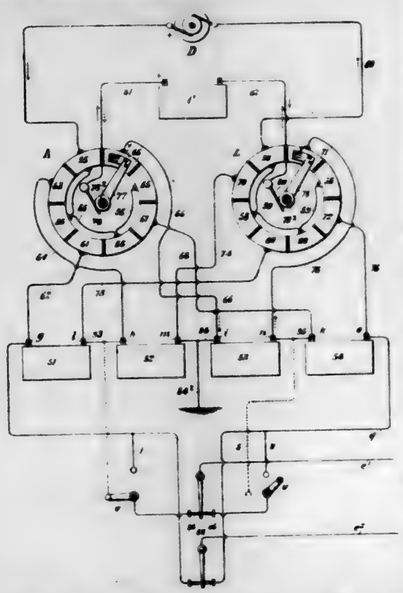
3. In a dress-pattern, the combination with a pattern formed of thin soft tissue-paper adapted to readily absorb glue or other adhesive and folded to form a package, a severable sealing-band extending around the package and being pasted or glued thereto to hold said package folded, both ends of said band being secured to the same side of the package, and a guard-sheet glued to the package and covering the ends of the sealing-band and preventing the detachment thereof.

4. In a paper dress-pattern the combination with a pattern formed of thin soft tissue-paper adapted to readily absorb glue or other adhesive and folded to form a package adapted to open along one of its edges, and a severable sealing-band extending around said package, one end of said band being pasted to one side of the package, the band extending thence across the free or open edges of the folded parts, and thence around the package, its other end being pasted over the end that was first secured in place, the band midway its ends being pasted to the other side of the package, whereby the package is doubly sealed and the free edges of the parts of the package are held together substantially as described.

5. In a paper dress-pattern, the combination with a pattern formed of thin soft tissue-paper adapted to readily absorb glue or other adhesive

and folded to form a package adapted to open along one of its edges, and a severable sealing-band extending around said package one end of said band being pasted to one side of the package, the band extending thence across the free or open edges of the folded parts, and thence around the package, its other end being pasted over the end that was first secured in place, the band midway its ends being pasted to the other side of the package, and a guard-sheet glued to the package and covering the ends of the sealing-band, and preventing the detachment thereof, whereby the package is doubly sealed and the free edges of the parts are held together, substantially as described.

709,465. MEANS FOR CONTROLLING THE CHARGING OF SECONDARY BATTERIES. JOHN BURRY, Fort Lee, N. J. Filed Jan. 10, 1900. Serial No. 914. (No model.)



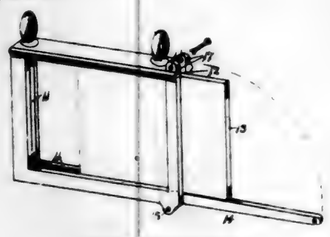
Claim.—1. In a system for supplying electric energy from a central station, the combination with a main line or feeder circuit, of a storage battery for supplying energy to a local or consumption circuit, said circuits being always isolated from each other, an energy-conveyer, and means for connecting said conveyer with and disconnecting it from said main and consumption circuits in alternation, whereby the said conveyer while disconnected from the feeder-circuit charges the storage battery and while disconnected from the consumption circuit receives energy from the feeder-circuit.

2. In a system for supplying electric energy from a central station, the combination with a main line or feeder circuit, of a plurality of storage batteries for supplying energy to a local or consumption circuit, said circuits being always isolated from each other, an energy-conveyer, and means for connecting said conveyer with said storage batteries one at a time in succession, said means disconnecting said conveyer from each storage battery before connecting it with the next in order and connecting the conveyer with said disconnecting it from the feeder-circuit in the intervals between the disconnection of the conveyer from one storage battery and its connection with the next in order, whereby said conveyer is charged while disconnected from the storage batteries and discharges while disconnected from the feeder-circuit.

709,466. ADVERTISING DEVICE. WILLIAM D. BUTT, Kansas City, Mo. Filed Apr. 9, 1901. Serial No. 55,044. (No model.)

Claim.—An advertising device comprising a plate having internal grooves and bifurcated at its outer end, the bifurcation registering with said grooves, a slidable plate in said grooves, an end bar pivoted at one end to the sides of the bifurcation at the lower corner of the plate and inclosed within the sides of the said bifurcation, and means for securing the upper end of said bar to the plate.

709,466.



709,467. TOY BLOCKS. EDWARD A. CARSON, Casco, Wis., assignor to Carson Toy Company, Casco, Wis., a Corporation of Wisconsin. Filed Apr. 7, 1902. Serial No. 101,641. (No model.)

Claim.—1. The combination of longitudinal side connecting-blocks having longitudinal grooves in their upper sides, end connecting-blocks having longitudinal grooves upon their upper sides, side box-blocks fitting the grooves of the longitudinal side blocks, end box-blocks fitting the grooves of the end connecting-blocks, and a bottom block connected to the longitudinal connecting-blocks.

2. The combination of longitudinal side connecting-blocks having longitudinal grooves upon their upper and under sides, end connecting-blocks having longitudinal grooves upon their upper sides, side box-blocks fitting the upper grooves of the longitudinal side blocks, end box-blocks fitting the grooves of the end blocks, bearing-blocks fitted in the longitudinal grooves on the under sides of the side connecting-blocks, said bearing-blocks provided with openings therethrough, axle-blocks fitting in the openings of the bearing-blocks, and wheel-blocks mounted on the axle-blocks.

3. In toy blocks, the combination of a frame having the longitudinal side blocks, bearing-blocks fitted thereto and extending downwardly therefrom, said bearing-blocks provided with openings therethrough, an axle-block provided with reduced extremities fitting the openings, said reduced extremities forming shoulders removed from the ends, and wheel-blocks mounted on the reduced extremities of the axle-block between the shoulders of said axle-block and the inner sides of the longitudinal side blocks, said wheels adapted to contact with the inner sides of said longitudinal side blocks on the longitudinal movement of the axle-block, and thereby prevent said axle-block from working out of the openings of the bearing-blocks.

4. In toy blocks, a sled or sleigh consisting of side connecting-blocks having grooves upon their under sides, standard-blocks extending downwardly from the under sides of the side connecting-blocks, said standard-blocks provided with side grooves, and also having grooves in their lower ends, runner-blocks fitting the grooves at the lower ends of the standard-blocks, brace-blocks fitting the side grooves of the rear standard-blocks and the under grooves of the side connecting-blocks, similar brace-blocks fitting the rear side grooves of the forward standard-blocks and the under grooves of the side connecting-blocks, blocks fitting the forward side grooves of the forward standard-blocks and the under grooves of the side connecting-blocks, and forming the forward portions of the runners, said blocks provided with openings, and a spindle-block having reduced ends, said reduced ends fitting the openings of the blocks forming the forward portions of the runners.

5. In toy blocks, a sleigh or sled consisting of side connecting-blocks having grooves upon their under sides, standard-blocks extending downwardly from the under sides of the side connecting-blocks, said standard-blocks provided with grooves upon their forward, rear, and inner sides and at their lower ends, runner-blocks fitting the grooves at the lower ends of the standard-blocks, brace-blocks fitting the forward and rear side grooves of the standard-blocks, and a connecting-block having its opposite ends fitting the grooves on the inner sides of the standard-blocks.

6. The combination of side connecting-blocks provided with grooves upon their upper and under sides, bearing-blocks fitting in the under grooves of the side connecting-blocks, said bearing-blocks provided with openings, an axle-block having its opposite ends fitting in said openings, wheel-blocks mounted on the axle-block, upright blocks extending upwardly from the side connecting-blocks, said upright blocks provided with grooves upon two of their sides, end blocks each having its perpendicular edges fitting in two of the opposed grooves of two of the upright blocks, and its lower edge fitting in the upper groove of the side connecting-block, and side blocks, each having its opposed end edges fitting into the grooves of two of the upright blocks.

7. The combination of side connecting-blocks provided with grooves upon their upper, under, and inner sides, bearing-blocks fitting in the under grooves of the side connecting-blocks, said bearing-blocks provided with openings, an axle-block having its ends fitting in said openings, wheel-blocks mounted on the axle-block, upright blocks extending upwardly from the side connecting-blocks, said upright blocks provided with grooves upon two of their sides, end blocks each having its perpendicular edge fitting in two of the opposed grooves of two of the upright blocks, and its lower edge fitting in the upper groove of the side connecting-block, side blocks each having its opposed under edges fitting two of the grooves of two of the upright blocks, and a handle composed of side arm-blocks and end handle-bar block, said side arm-blocks having their inner ends fitting the inner grooves of the side connecting-blocks, and said handle-bar block having its opposite ends provided with grooves to receive the outer ends of the side arm-blocks.

8. In toy blocks, a wheel-rake consisting of a head-block having grooves on its under and inner sides, rake-teeth blocks fitting in said under grooves and extending downwardly therefrom, side connecting-blocks having grooves upon their under and inner sides, a bottom block having its edges fitting in the inner side grooves of the side connecting-blocks and the inner side groove of the head-block, bearing-blocks fitting the under grooves of the side connecting-blocks, said bearing-blocks provided with openings, an axle-block fitting the openings of the bearing-blocks, and wheel blocks mounted on the axle-block.

9. In toy blocks, a wheel-rake, consisting of a head-block having grooves on its under, inner, and upper sides, rake-teeth blocks fitting in the under groove, and extending downwardly therefrom, side connecting-blocks having grooves upon their under and inner sides, a bottom block having its edges fitting in the inner side grooves of the side connecting-blocks and the inner side groove of the head-block, bearing-blocks fitting the under grooves of the side connecting-blocks, said bearing-blocks provided with openings, an axle-block fitting the openings of the bearing-blocks, wheel-blocks mounted on the axle-block, and a seat extending upwardly from the head-block, said seat consisting of two upright blocks having grooves upon their inner and forward sides, a connecting-block having its opposite ends fitting the inner grooves of the upright blocks, horizontal blocks seated on top of the upright blocks, said horizontal blocks provided with grooves on their under and inner sides, brace-blocks fitting the forward grooves of the upright blocks and the under grooves of the horizontal blocks, and a seat-bottom block having its opposite ends fitting the inner side grooves of the horizontal blocks.

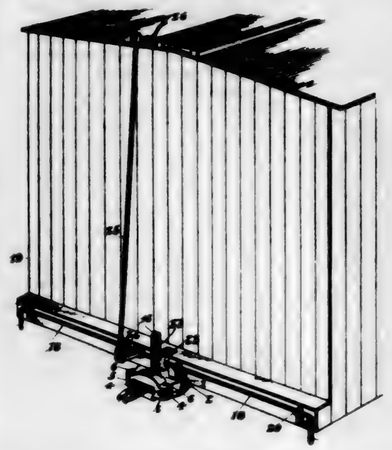
10. In toy blocks, a hay-rack consisting of the end pieces and the longitudinal slats, each end piece, consisting of two blocks having their inner ends beveled and fitted together, in order to give an obtuse-angular form to each end piece, and said end pieces blocks provided with grooves upon their upper sides, and grooves upon their inner sides, connecting-blocks having their ends fitting the upper grooves of the blocks of each end piece, and thereby holding said blocks together, and longitudinal slat-blocks having their opposite ends fitting the end grooves of the blocks of the end pieces.

11. In toy blocks, a plow consisting of a plow-beam block having a groove on its under side, a plowshare-block having its opposite ends beveled, one beveled end thereof fitting against the under side of the plow-beam block, whereby the plowshare-block extends downwardly from the plow-beam block at a forward incline, and said plowshare-block provided with a groove in its forward side, and a connecting-block fitting in the groove of the plowshare-block and also in the groove on the under side of the plow beam block.

12. In toy blocks, a plow consisting of a plow-beam block having a groove on its under side, a plowshare-block extending downwardly and at a forward incline from the under side of the plow-beam block, said plowshare-block provided with a groove in its forward side and also with a groove in one of its lateral sides, a connecting-block fitting in the groove in the forward side of the plowshare-block, and also in the groove in the under side of the plow-beam block, and a moldboard-block fitting in the groove in the lateral side of the plowshare-block and extending laterally therefrom.

13. In toy blocks, a plow consisting of a plow-beam block having a groove on its under side, a plowshare-block extending downwardly and at a forward incline from the under side of the plow-beam block, said plowshare-block provided with a groove in its forward side, a connecting-block fitting in the groove of the plowshare-block and also in the groove on the under side of the plow-beam block, and a cutter or colter block fitting in the groove on the under side of the plow-beam block and bearing against the plowshare-block.

709,468. CAR-COUPLING. ALBERT B. CARTER, Hazlehurst, Miss. Filed Apr. 26, 1902. Serial No. 104,848. (No model.)



Claim.—1. In a car-coupler, the combination with a draw-head having a vertically-movable pin which is fixed against lateral movement, of a coupling-link which is separate from the draw-head and is provided with a lateral shoulder for engagement with the pin, and a spring to yieldingly hold the shoulder of the link in engagement with the pin.

2. In a car-coupler, the combination with a draw-head which is held against lateral movement, and is provided with a vertically-movable coupling-pin which is fixed against lateral movement, of a coupling-link which is separate from the draw-head and is provided with a lateral shoulder for engagement with the pin, and a spring to bear against the outer side of the link and yieldably hold the shoulder thereof in engagement with the coupling-pin.

3. In a car-coupler, the combination with a draw-head, having a vertically-movable pin, of a pair of links which have their opposite ends provided with lateral shoulders upon their inner sides for engagement with the locking-pin, and springs disposed at opposite sides of the pin to bear against the links and yieldably hold the same in engagement with the pin.

4. In a car-coupler, the combination with a draw-head, of a vertically-movable coupling-pin therefor, a coupling-link provided with lateral shoulders for engagement with the coupling-pin, and a spring having one end secured to the draw-bar with its free end portion bearing against the outer side of the link to hold the same in yieldable engagement with the pin and provided at its free end with a guide projection working in a guideway formed in the draw-head.

5. In a car-coupler, the combination with a draw-head, and a vertically-movable coupling-pin piercing the top thereof, of a pair of coupling-links which are provided with lateral inwardly-directed shoulders for engagement with the back of the pin, and leaf-springs located at opposite sides of the links with their free ends bearing against the same to hold the shoulders of the links yieldably in engagement with the pin, the free ends of the springs having lateral projections working in sockets formed in the opposite side walls of the draw-head.

6. In a car-coupler, the combination with a draw-head, of an endwise-movable coupling-pin, a headed link for detachable engagement with the pin, a spring to yieldably hold the link in engagement with the pin, and an abutment in rear of the pin to form a fulcrum-bearing for the link substantially as and for the purpose set forth.

7. In a car-coupler, the combination with a draw-head, of an endwise-movable locking-pin, a beveled abutment in rear of the pin, a pair of arrow-headed links for engagement with the pin, and springs to yieldably hold the heads of the links in detachable engagement with the pin, the abutment forming a fulcrum-bearing for the inner ends of the links in the manner substantially as described.

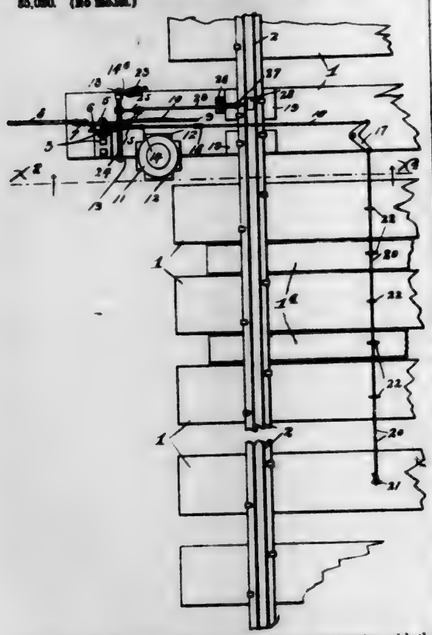
8. In a car-coupler, the combination with a draw-head, of an endwise-movable coupling-pin, a forwardly-tapered abutment-block fitted in the back of the draw-head and having its forward end provided with a reduced forwardly-tapered projection terminated adjacent to the rear side of the coupling-pin, leaf-springs secured between the opposite sides of the abutment-block and the corresponding sides of the draw-head, the forward free ends of the springs being projected beyond the position of the coupling-pin and having lateral projections working in recesses formed

in the sides of the draw-head, said projections closing the spaces between the free ends of the springs and the adjacent sides of the draw-head, and a pair of coupling-links provided at opposite ends with the arrow-heads for engagement with the coupling-pin, the springs normally lying in engagement with the links to hold the same yieldably in detachable engagement with the pin, and the reduced projection of the abutment forming a fulcrum for the inner ends of the links.

9. In a car-coupler, the combination with a draw-head having sockets in its opposite inner sides, of a coupling-pin, leaf-springs having their rear ends connected to the draw-head and inclined inwardly and forwardly, the free ends of the springs having lateral outwardly-directed projections working in the respective guide-sockets and closing the spaces between the free ends of the springs and the respective sides of the head, and a pair of headed links for engagement with the pin.

10. In a car-coupler, the combination with a draw-bar, of an endwise-movable coupling-pin having teeth upon the back thereof, a rock-bar located in rear of the pin, a pinion carried by the rock-bar and in mesh with the teeth of the pin, a crank-arm carried by the rock-bar, a connecting-rod rising from the crank-arm, and an intermediately-fulcrumed lever connected to the upper end of the rod.

709,469. DANGER-SIGNAL DEVICE FOR RAILWAYS. FRED G. CRANDELLE, Minneapolis, Minn. Filed Dec. 7, 1901. Serial No. 85,080. (No model.)



Claim.—1. A danger-signal for railways in combination with the bell-crank 14, actuating-spring 23 and trip connections 16, 17 and 20, the latter of which is anchored to the track at its extended end and is passed through intermediate guides on the track, substantially as described.

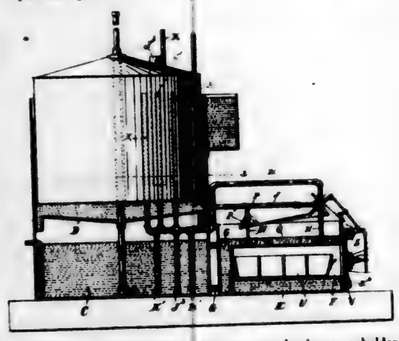
2. The combination with a lamp 11, of a semaphore provided with the bull's-eye 10 and sheave 6, the bell-crank 14 connected to said sheave 6 by connection 15, the trip connection 16, 17, 20 connected to said bell-crank and to the track, as described, and the actuating-spring 23 connected to and operating upon the said bell-crank 14, substantially as described.

3. The combination with a railway-track, of a torpedo-holder for moving a torpedo into and out of contact with the track, and means for automatically throwing said holder from an inoperative to an operative position, comprising the bell-crank 14, the actuating-spring 23, and the connection 16, 17, 20, which section 20 is anchored at its extended end and is passed through guides on the intermediate ties, substantially as described.

4. The combination with a railway-track involving auxiliary ties or ...ce, of a signal device and a trip device placed between the ordinary ties, therefor arranged to be actuated by movements of said auxiliary ties, substantially as described.

5. The combination with the rails and ties of a railway, of auxiliary ties loosely embedded between the said ties, and a signal device involving a flexible trip connection anchored at its extended end and passed loose through guides on the said auxiliary ties, substantially as described.

709,470. ACETYLENE-GAS GENERATOR. JOHN C. CHARBONEAU, Mount Clemens, Mich. Filed Nov. 22, 1901. Serial No. 83,221. (No model.)

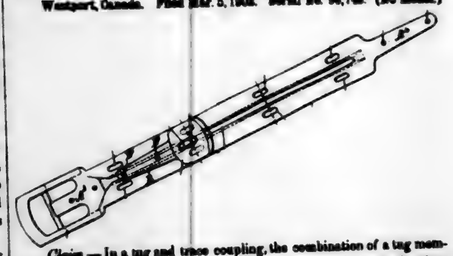


Claim.—1. In an acetylene-gas generator, having a gas-holder consisting of a tank and a bell, and having a gas-generator consisting of a cooling-tank open at the top and a generator-chamber within said cooling-tank, a false bottom in the tank of the gas-holder to form a drip-chamber in the lower end thereof, an annular channel around the edge of said bottom and depending below the same adapted to receive the lower end only of the gas-bell and form a water seal, and pipes connecting the drip-chamber with the cooling-tank at the top and bottom respectively to cause a circulation of water therein.

2. In an acetylene-gas generator, in combination, a gas-holder, a generator-chamber, a door hinged to said chamber, a water-feed pipe to supply water to said chamber, as hut-off in said water-feed pipe, an operating-lever for said shut-off, a gas-supply pipe leading from said chamber, a two-way valve in said gas-supply pipe, a vent-pipe leading from said valve, an operating-lever for said valve, a rod connecting said levers, a cam pivoted on said chamber and adapted to engage said door to hold the same closed, a rod connecting said cam and the lever on said valve and means whereby the operation of said valve is necessitated before the said door may be unfastened.

3. In an acetylene-gas generator, in combination, a gas-holder, a generator-chamber, a water-feed pipe to supply water to said chamber, a gas-supply pipe leading from said chamber, a two-way valve in said gas-supply pipe, a vent-pipe leading from said valve, an operating-lever for said valve, a door hinged at its lower side to said chamber, hooks on said chamber adjacent to the ends of said door, a spanner-bar to engage said hooks and having a screw-threaded opening, a screw engaging said opening and provided with a forked handle, ears on said chamber adjacent to the upper side of said door, a cam pivoted between said ears and provided with an operating-handle a rod pivotally connecting the operating-lever on said valve and said cam-handle, and a rod rigidly secured to said cam-handle and adapted to project into the fork of the handle of said screw.

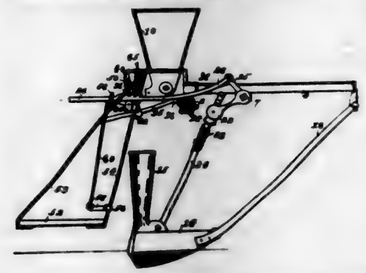
709,471. TUG AND TRACE COUPLING. ALEXANDER M. CRAIG, Westport, Canada. Filed Mar. 5, 1902. Serial No. 96,743. (No model.)



Claim.—In a tug and trace coupling, the combination of a tug member having a longitudinal slideway or channel and corrisative perforations

on opposite sides thereof, and a trace member having an enlarged head dished on the under side and containing a rock-shaft having an elbow thumb-lever projecting through said head and flush therewith, two tongues engaging said perforations in the tug member, and a guide-lug sliding in said channel or slideway to hold the tug and trace members connectedly, and a spring to keep said tongues in coupling engagement with the tug member, as set forth.

709,472. SEEDING-MACHINE. FRANK R. DAVIS, La Crosse, Wis. Filed Apr. 4, 1902. Serial No. 101,408. (No model.)



Claim.—1. In a seeding-machine, a frame mounted on carrying-wheels, shoes, means for pivotally attaching the front of the shoes to the frame, and a connection between the shoes and the wheels, whereby the draft of the team is utilized to raise the shoes.

2. In a seeding-machine a frame mounted on carrying-wheels, an axle adapted to rotate with the wheels, shoes, means for pivotally attaching the shoes to the front of the frame, and a connection between the wheels and shoes, whereby the draft of the team is utilized to raise the shoes.

3. In a seeding-machine a frame mounted on carrying-wheels, an axle, a rock-shaft, shoes connected to the rock-shaft, and a connection between the wheels and the rock-shaft for raising the shoes by the draft of the team.

4. In a seeding-machine a frame mounted on carrying-wheels, a rotating axle, a sprocket-wheel upon the axle, a rock-shaft, shoes, connection between the rock-shaft and the shoes, and a connection between the rock-shaft and sprocket-wheel on the axle, whereby the rotating of the wheel by the draft of the team will raise the shoes.

5. In a seeding-machine a frame mounted on carrying-wheels, an axle, a sprocket-wheel on the axle, a rock-shaft, shoes attached to the rock-shaft, a rack-bar attached to the rock-shaft and adapted to engage the sprocket-wheel on the axle, for the purposes shown.

6. In a seeding-machine the combination of an axle, a rock-shaft, shoes connected to the rock-shaft, a connection between the rock-shaft and the axle, means connected with the axle for rotating the rock-shaft to raise the shoes.

7. In a seeding-machine a frame mounted on carrying-wheels, a rotating axle, a sprocket-wheel mounted on the axle, a rock-shaft, shoes attached to the rock-shaft, a rack-bar connected with the rock-shaft and a lever for bringing the rack-bar into engagement with the sprocket-wheel on the axle, whereby the shoes are raised by the draft of the team.

8. In a seeding-machine a frame mounted on carrying-wheels, a rotating axle, a sprocket-wheel attached to the axle, shoes attached to the frame, a rock-shaft, connection between the rock-shaft and the shoes, a rack-bar connected to the rock-shaft, and means for bringing the rack-bar and sprocket-wheel into engagement for the purpose of utilizing the draft of the team in raising the shoes.

9. In a seeding-machine a frame mounted on carrying-wheels, shoes attached to the frame, a rock-shaft, a connection between the rock-shaft and the shoes, an axle, a connection between the axle and rock-shaft, whereby the draft of the team is utilized to raise the shoes, and means for holding the shoes in an elevated position for the purposes shown.

10. In a seeding-machine a frame mounted on carrying-wheels, shoes attached to the frame, a rock-shaft, connection between the rock-shaft and the shoes, a rotating axle, a sprocket-wheel on said axle, an arm attached to the rock-shaft, a rack-bar pivoted to said arm and adapted to engage the sprocket-wheel on said axle and means for holding the shoes in an elevated position, for the purposes shown.

11. In a seeding-machine, a frame, an axle, a sprocket-wheel on the axle, a rock-shaft suspended from the frame, shoes connected to the rock-shaft, a rack-bar pivoted to the rock-shaft, and adapted to engage the sprocket-wheel on the axle, means for holding the rack-bar out of engagement with the sprocket-wheel and a lever for bringing the rack-bar into engagement with the sprocket-wheel, whereby the draft of the team is utilized to raise the drills.

12. In a seeding-machine, a frame, a rock-shaft suspended from the frame, shoes attached to the rock-shaft, and means operated by the rock-shaft, for holding the shoes at a given depth in the ground, for the purposes shown.

13. In a seeding-machine, a frame, a rock-shaft suspended from the frame, shoes attached to the rock-shaft and means operated by the rock-shaft, for holding the shoes at a given depth in the ground, and means for releasing said shoes, for the purposes shown.

14. In a seeding-machine, the combination of a frame, mounted on carrying-wheels, a rock-shaft, shoes attached to the rock-shaft, a rock-bar attached to the rock-shaft, notches on said rock-bar, and a catch adapted to engage said notches to hold the shoes in a predetermined position in the ground.

15. In a seeding-machine, a frame mounted on carrying-wheels, a rotating axle, a rock-shaft, shoes attached to the rock-shaft, connection between the rock-shaft and the axle, and means for holding the shoes in a given position in the ground, and a lever for releasing the shoes and for bringing them into operative relation and the connection between the rock-shaft and the axle, for elevating the shoes by the draft of the team.

16. In a seeding-machine the combination of a frame mounted on carrying-wheels, a rotating axle, a rock-shaft, shoes attached to the rock-shaft, connection between the rock-shaft and the axle for elevating the shoes by the rotation of the axle, and means attached to the rock-shaft for holding the shoes in their elevated position.

17. In a seeding-machine a frame mounted on carrying-wheels, a rock-shaft, shoes connected with the rock-shaft, means for raising the shoes by the draft of the team, and means for holding the shoes in such elevated position for the purposes shown.

18. In a seeding-machine a frame mounted on carrying-wheels, an axle adapted to rotate with the wheels, a sprocket-wheel upon the axle, a rock-shaft, shoes attached to the rock-shaft, a rack-bar attached to the rock-shaft, an arm carrying a catch, a hanger with which the catch on the frame engages, a spring for holding the catch-bar out of engagement with the sprocket-wheel, and a lever for bringing the rack-bar into engagement with the sprocket-wheel on the axle, all combined for the purposes shown.

19. In a seeding-machine a rotating axle, a sprocket-wheel upon said axle, a rock-shaft, shoes attached to the rock-shaft, and a rack-bar attached to the rock-shaft, whereby the rotation of the axle will raise the shoes and throw the rack-bar out of engagement with the sprocket-wheel on the axle, for the purposes shown.

20. In a seeding-machine a frame mounted on carrying-wheels, a driver's riding-platform suspended from the machine, shoes attached to the frame, a connection between the axle and the shoes, and a foot-lever near the driver's riding-platform for the purpose of operating the shoes by the draft of the team while standing on the step.

21. In a seeding-machine a frame mounted on carrying-wheels, a driver's riding-platform, suspended from the rear of the machine, a foot-lever for operating said mechanism connected with and in close relation to the platform, for the purposes shown.

709,473. HITCHING DEVICE. AUSTIN H. DEBORD, Canon City, Colo. Filed July 3, 1902. Serial No. 114,254. (No model.)

Claim.—In a hitching device, the combination with a weight and suspending means of a plate through which said suspending means passes, said plate being provided with a hole or opening having one portion thereof larger than the other, and means on said plate for holding the suspending means in the smaller portion of the opening.

709,474. ANIMAL-POKE. HORATIO E. DOWNING, Reading, Okla. Filed Jan. 14, 1902. Serial No. 89,720. (No model.)

Claim.—1. An animal-poke comprising sides having spurs or projections, upper and lower connecting-bars hinged to the sides, and springs for holding the spurs or projections normally away from an animal, substantially as described.

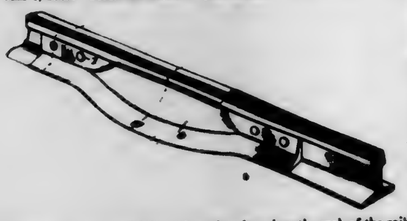
2. An animal-poke comprising sides having spurs or projections, upper and lower connecting-bars hinged to the sides, one of the connecting-bars being provided with extended pintles, and coiled springs disposed on the extended pintles, and having arms engaging the sides and the adjacent connecting-bar, substantially as described.

3. An animal-poke comprising sides having spurs or projections means for hingedly connecting the sides, arms extending respectively from the front face of one side to the rear face of the other side, and a rod hinged to the arms and adapted to cause the sides to turn inward and outward simultaneously, substantially as described.

4. An animal-poke comprising sides having spurs or projections, means for hingedly connecting the sides, and upright loops extending from the front or outer faces of the sides and arranged to be engaged by the head of a cow, substantially as described.

5. An animal-poke comprising sides having spurs, upper and lower connecting-bars hinged to the sides, arms extending respectively from the front face of one side and from the rear face of the other side, a rod hinged to the arms and connecting the same to cause the sides to turn inward and outward simultaneously, and loops extending longitudinally of the sides and projecting from the outer or front faces thereof, substantially as described.

709,475. RAIL-JOINT. JOHN W. BLESS, Rantoul, Kans. Filed Jan. 9, 1902. Serial No. 89,047. (No model.)

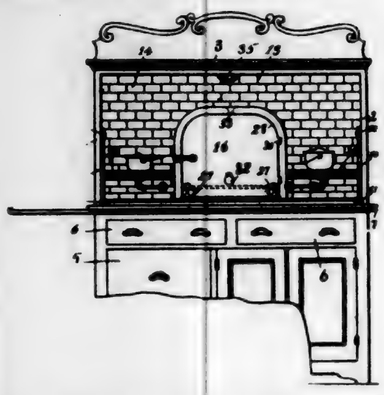


Claim.—1. In a rail-joint, a bar placed against the web of the rails forming the joint and having its end portions of angle form to overlap the foot and web of the rails and having its middle portion thickened and formed with an outwardly-curved basal flange apertured to receive a fastening, the end portions of the thickened part sloping and merging into the vertical and horizontal end portions of the said bar, substantially as specified.

2. In a rail-joint, a bar placed against the inner side of the web and having its middle portion thickened and upwardly sloped, a second bar placed against the outer side of the web and having its end portions of angle formation and its middle portion thickened and its upper edge constructed to form a seat for the lower corner of the rails, the thickened part of the outer bar having its end portions sloping and formed with an outwardly-curved basal flange apertured to receive a fastening, substantially as specified.

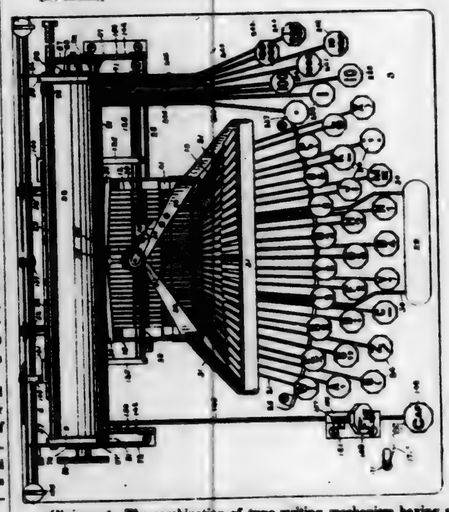
709,476. COOKING-CABINET. HERMAN FAGERLIN, San Francisco, Cal., assignor of one-half to Gustavus Zimmermann, San Francisco, Cal. Filed Mar. 31, 1902. Serial No. 100,574. (No model.)

Claim.—1. As an article of manufacture, the cooking-cabinet comprising the top, the back, the ends, and the swinging front, all lined with incombustible material, the oven fixedly secured in said cooking-chamber, spaced at the side and top from the side and top of said cooking-chamber, a gas-pipe entering said cooking-chamber, and having a branch entering said oven, and having burners fixedly secured in said cooking-chamber and oven respectively, the burners of said latter pipe being directed downward upon the floor of the oven, substantially as described.



2. As an article of manufacture, the cooking-cabinet comprising the top, the back, the ends, and the swinging front, all lined with incombustible material, the oven fixedly secured in said cooking-chamber, having its body formed of non-metallic incombustible material, spaced at the side and top from the side and top of said cooking-chamber, a gas-pipe entering said cooking-chamber, and having a branch entering said oven, and having burners fixedly secured in said cooking-chamber and oven respectively, the burners of said latter pipe being directed downward upon the floor of the oven, substantially as described.

709,477. ADDING-MACHINE. BORIES FYOR, Astoria, N. Y., assignor to the Union Typewriter Company, Jersey City, N. J., a Corporation of New Jersey. Filed Nov. 28, 1898. Serial No. 697,508. (No model.)



Claim.—1. The combination of type-writing mechanism having a carriage moved step by step for letter-spacing, adding-wheels, independent operating means for said wheels, a driver for operating said means one by one, said driver and said adding-wheels and operating means being relatively movable, toothed wheels connected with said driver, a single rectilinearly-movable sliding frame having two toothed bars for engaging said toothed wheels to actuate the driver, guideways for said frame, and means actuated by the type-operating mechanism of the type-writing machine and moving said frame variable distances from an initial position, substantially as described.

2. The combination of type-writing mechanism having a carriage moving step by step for letter-spacing, adding number-carriers, independent operating means for said number-carriers, a driver for operating said independent means one at a time, said driver and said adding mechanism and operating means being relatively movable, toothed wheels connected with said driver, a rectilinearly-movable frame provided with two toothed bars meshing with said toothed wheels, and cams operated by the type-operating mechanism of the type-writing machine for engaging and moving said frame variable distances from an initial position, substantially as described.

3. The combination of type-writing mechanism having a carriage moving step by step for letter-spacing, adding number-carriers provided with independent means for operating said number-carriers, a driver for operating said independent means one at a time, said driver and said number-carriers being relatively movable, toothed wheels connected with said driver, a reciprocatory frame or plate provided with a series of steps and with a toothed bar meshing with said toothed wheel, and cams for engaging said steps and operated by the type-operating mechanism of the type-writing machine for moving said frame or plate variable distances from an initial position, substantially as described.

4. The combination of type writing mechanism having a carriage moved step by step for letter-spacing, adding number-carriers, independent means for operating said number-carriers, a driver for operating said independent means one at a time, said driver and said number-carriers being relatively movable, two toothed wheels connected with said driver, a reciprocatory frame or plate provided with two toothed bars meshing with said toothed wheels and with a series of steps, and cams for engaging said steps and operated by the type-operating mechanism of the type-writing machine, substantially as described.

5. The combination of type-writing mechanism having a step-by-step moving carriage, adding number-carriers, independent means for operating said number-carriers, a driver for operating said independent means one at a time, said driver and said number-carriers being relatively movable, a reciprocatory plate or frame, gearing connecting said plate or frame and said driver for rotating the driver, and cams for engaging said frame and moving it different distances and operated by the type-operating mechanism of the type-writing machine, substantially as described.

6. The combination of type-writing mechanism having a carriage moving step by step for letter-spacing, adding number-carriers, independent means for operating said number-carriers, a driver for operating said independent means one at a time, said driver and said number-carriers being relatively movable, a reciprocatory plate or frame provided with a series of steps, gearing intermediate said plate or frame and said driver for rotating the driver, and cams operated by the type-operating mechanism of the type-writing machine and coacting with said steps, substantially as described.

7. The combination of a type-writer carriage, adding mechanism having independent means for operating its number-carriers, a variable-throw driver for operating said independent means one at a time, said driver and said adding mechanism being relatively movable, and mechanism for connecting said moving part with the type-writer carriage at a predetermined point in the forward traverse thereof to move therewith during the further progress of the carriage, substantially as described.

8. The combination of a type-writer carriage having a step-by-step letter-feed, adding mechanism having independent means for operating its number-carriers, a rotatable driver connected to and operated by the digit-keys of the type-operating mechanism and operating said independent means one at a time, said driver and said adding mechanism being relatively movable, and mechanism for connecting such moving part with the type-writer carriage at a predetermined point in the forward traverse thereof to move step by step during the further progress of the carriage, substantially as described.

9. The combination of a type-writer carriage, adding mechanism independently-operable number-carriers, a variable-throw driver for operating said carriers one at a time, said driver and said adding mechanism being relatively movable and being disengaged during a part of the forward traverse of the type-writer carriage, mechanism for connecting said moving part with the type-writer carriage at a predetermined point in the forward traverse thereof to move step by step during the further progress of the carriage, and means for locking said driver against said step-by-step movement until said carriage reaches said point, substantially as described.

10. The combination of the carriage of a type-writer, key-actuated adding mechanism comprising toothed wheels 178, 179, 181, 182 and 183, for operating its number-carriers, a driver for operating said toothed wheels 178 one at a time, and gearing for discontinuously but automatically connecting said driver with the type-writer carriage by a movement of said carriage to move the driver axially to engage with said toothed wheels 178 in succession, whereby said type-writer carriage may move during a portion of its travel independently of the driver, substantially as described.

11. The combination of the carriage of a type-writer, key-actuated adding mechanism comprising toothed wheels 178, 179, 181, 182 and 185, for operating its number-carriers, a rotatable driver for operating said toothed wheels 178 one at a time, and mechanism for discontinuously connecting said driver with the type-writer carriage and thrown automatically into operation when said carriage reaches a given point in the forward traverse thereof and then moving said driver step by step from one to another of said toothed wheels 178 as the carriage progresses, whereby said type-writer carriage may move during a portion of its travel independently of the driver, substantially as described.

12. The combination of a type-writer carriage, a key-actuated adding mechanism comprising toothed wheels 178, 179, 181, 182 and 183 for operating its number-carriers, a driver for operating said toothed wheels 178 one at a time and disengaged automatically and discontinuously therefrom during a part of the forward motion of the said carriage, means for variably rotating said driver, and mechanism operated by or controlled from the said carriage for moving said driver into engagement with and from one to another of said toothed wheels 178 as the carriage progresses, substantially as described.

13. The combination of the carriage of a type-writer, key-actuated adding mechanism comprising toothed wheels 178, 179, 181, 182 and 183, for operating its number-carriers, a driver-pinion disengaged from said toothed wheels 178, and disconnected from said carriage during a part of the forward traverse of the said carriage and mechanism for automatically connecting said carriage with the said driver at a given point in said forward traverse and moving said driver into engagement with and from one to another of said toothed wheels 178 as the carriage progresses, whereby said type-writer carriage may move during a portion of its travel independently of the driver, substantially as described.

14. The combination of the carriage of a type-writer, an adding mechanism having independent means for operating its number-carriers, a driver for operating said independent means one at a time and disengaged therefrom during a part of the forward traverse of said carriage, a to-and-fro movable rack with which said driver is connected to be moved axially, a pinion meshing with said rack, and mechanism for connecting said pinion with the type-writer carriage, substantially as described.

15. The combination of the carriage of a type-writer, an adding mechanism having independent means for operating its number-carriers, an axially-movable driver for operating said independent means one at a time and disengaged therefrom during a part of the traverse of said carriage, a reciprocatory rack connected with said driver to move it axially, a pinion meshing with said rack, and devices for connecting said pinion with the type-writer carriage at a given point in the forward traverse thereof, whereby said driver is moved into engagement with and from one to another of said independent means as the carriage progresses, substantially as described.

16. The combination of a type-writer carriage, an adding mechanism having independent means for operating its number-carriers, a driver disengaged from said operating means during a part of the forward traverse of the type-writer carriage, a short rack connected with said carriage, a pinion with which said rack meshes at a given point in the forward traverse of said carriage, and connections between said pinion and said driver for moving the driver axially step by step, substantially as described.

17. The combination of the type-writer carriage, an adding mechanism having independent means for operating its number-carriers, a driver for operating said independent means one by one and disengaged therefrom during a part of the forward traverse of the carriage, a short rack connected with said carriage, a pinion with which said rack meshes at a given point in the forward traverse of the carriage, a shaft carrying said pinion, a second pinion on said shaft, and a rack meshing with said pinion and connected with said driver to move the same axially into engagement with and from one to another of said operating means, substantially as described.

18. The combination of a type-writer carriage, an adding mechanism having independently-operable number-carriers, a driver disengaged from said adding mechanism during a part of the forward traverse of the type-writer carriage, said driver and said adding mechanism being relatively movable, a short rack connected with said type-writer carriage, a pinion with which said rack meshes at a given point in the forward traverse of said carriage, and connections between said pinion and said movable element for moving the same step by step and causing engagement between said driver and said adding mechanism, substantially as described.

19. The combination of a type-writer carriage, adding mechanism, means for actuating the adding mechanism and disconnected from the car-

riage during part of the forward traverse thereof and thrown into action by the carriage at a predetermined point in the forward traverse of the carriage, and means for locking or holding the said actuating means until the carriage reaches said predetermined point, substantially as described.

20. The combination of a type-writer carriage, an adding mechanism having independent means for operating its number-carriers, a driver for operating said means one at a time and disengaged therefrom during a part of the forward motion of the carriage, mechanism intermediate said driver and said carriage for moving the driver axially into engagement with and from one to another of said operating means after the carriage has reached a certain point in its forward traverse, and locking mechanism for preventing axial motion of said driver before said carriage reaches said point, substantially as described.

21. The combination of a type-writer carriage, adding mechanism having independent operating means for its number-carriers, a driver for operating said independent means one by one and disengaged therefrom during a part of the forward traverse of said carriage, mechanism having an element rotated by said carriage after the carriage has reached a predetermined point in its forward traverse and connected to said driver to move the same axially, a flat-faced block connected with said rotary element, and a bar connected with said carriage and coacting with said flat-faced block to prevent rotation of said element before the carriage reaches said predetermined point, substantially as described.

22. The combination of a type-writer carriage, adding mechanism, a driver for operating said adding mechanism and disengaged therefrom during a part of the forward motion of said carriage, a rack on said carriage, a pinion with which said rack is adapted to mesh at a given point in the forward motion of said carriage, mechanism intermediate said pinion and said driver for moving the driver step by step in the direction of its axis of motion, a lug or projection on and eccentric to said pinion, and a locking-bar connected with said carriage and coacting with said lug to prevent rotation of said pinion before the same meshes with said rack, substantially as described.

23. The combination of a type-writer carriage having a step-by-step letter-space feed, adding mechanism having independent operating means for its number-carriers arranged in line at distances apart greater than the uniform letter-space feed of said carriage, a driver for operating said independent means one by one, and motion-multiplying toothed gearing intermediate said driver and said carriage and including a rack upon the carriage and a pinion in mesh therewith for moving the driver from one to another of said independent means, substantially as described.

24. The combination of a type-writer carriage, adding mechanism having independent operating means for its number-carriers, said means being arranged at distances apart greater than the step-by-step feed of said carriage, a driver for operating said independent means one by one and disengaged therefrom during a part of the forward traverse of said carriage, and speed-multiplying gearing intermediate said driver and said carriage and including a rack upon said carriage and a pinion in mesh therewith for moving the driver from one to another of said independent means, substantially as described.

25. The combination of a type-writer carriage having a step-by-step letter-space feed, adding mechanism having independent operating means for its number-carriers, said means being at distances apart greater than said step-by-step feed, a driver disengaged from said independent means during a part of the forward traverse of said carriage, a rack on said carriage, a pinion with which said rack meshes at a given point in the forward traverse of said carriage, and speed-multiplying mechanism connecting said pinion with said driver and moving said driver axially into engagement with and from one to another of said independent means, substantially as described.

26. The combination of a type-writer carriage, adding mechanism having independent operating means for its number-carriers, said means being arranged at distances apart greater than the step-by-step feed of said carriage, a driver for operating said independent means one by one and disengaged therefrom during a part of the forward traverse of said carriage, and speed-multiplying mechanism intermediate said driver and said carriage for moving the driver axially into engagement with and from one to another of said independent means, with locking mechanism for preventing motion of said speed-multiplying mechanism until the carriage reaches a predetermined point in its forward motion, substantially as described.

27. The combination of a type-writer carriage having a step-by-step letter-space feed, adding mechanism having independent operating means for its number-carriers, said means being at distances apart greater than said step-by-step feed, a driver disengaged from said independent means during a part of the forward traverse of said carriage, a rack on said carriage, a pinion with which said rack meshes at a given point in the forward traverse of said carriage, and speed-multiplying mechanism connecting said pinion with said driver and moving said driver axially into engagement with and from one to another of said independent means, with mechanism for locking said pinion and multiplying mechanism against motion until the carriage reaches said predetermined point in its forward motion, substantially as described.

28. The combination of a type-writer carriage having uniform step-by-step letter-space feed, adding-wheels, independent gears for operating said wheels, said gears being placed at a uniform distance from center to center greater than the uniform feed of the carriage, a driving-pinion movable in the direction of its axis and engaging with said independent pinions one after another, and speed-multiplying mechanism connecting said carriage and said driving-pinion for moving the pinion axially, substantially as described.

29. The combination of a type-writer carriage having a uniform step-by-step letter-space feed, adding-wheels, independent gears for operating said wheels, said gears being at uniform distances from center to center greater than the uniform feed of the carriage, and an axially-movable driving-pinion for engaging said independent gears one at a time and disengaged therefrom during a part of the forward traverse of said carriage, and speed-multiplying connections between said carriage and said driving-pinion for moving the said pinion axially into engagement with and from one to another of said independent pinions, substantially as described.

30. The combination of a type-writer carriage having uniform step-by-step letter-space feed, adding-wheels, independent gears for operating said wheels, said gears being at a uniform distance from center to center greater than the uniform feed of the carriage, an axially-movable driving-pinion for operating said independent gears one after another and disengaged therefrom during a part of the forward traverse of the said carriage, a rack on said carriage, a pinion in the path of said rack and meshing therewith when the carriage reaches a given point in its forward traverse, and speed-multiplying connections between said pinion and said driver for moving the driver axially, substantially as described.

31. The combination of a type-writer carriage having uniform step-by-step letter-space feed, adding-wheels, independent gears for operating said wheels, said gears being at a uniform distance from center to center greater than the uniform feed of the carriage, an axially-movable driving-pinion for operating said independent gears one after another and disengaged therefrom during a part of the forward traverse of the said carriage, and speed-multiplying mechanism for connecting said driver with said carriage when the carriage reaches a given point in its forward traverse, with mechanism locking said speed-multiplying mechanism against motion until such time as the carriage reaches said given point, substantially as described.

32. The combination of a type-writer carriage having uniform step-by-step letter-space feed, adding-wheels, independent gears for operating said wheels, said gears being at a uniform distance from center to center greater than the uniform feed of the carriage, an axially-movable driving-pinion for operating said independent gears one after another and disengaged therefrom during a part of the forward traverse of the said carriage, a rack on said carriage, a pinion in the path of said rack and meshing therewith when the carriage reaches a given point in its forward traverse, and speed-multiplying connections between said pinion and said driver for moving the driver axially, and mechanism for locking said pinion against motion until the carriage reaches the said given point, substantially as described.

33. The combination of a type-writer carriage having uniform step-by-step letter-space feed, adding-wheels, independent gears for operating said wheels, said gears being at a uniform distance from center to center greater than the uniform feed of the carriage, an axially-movable driving-pinion for operating said independent gears one after another and disengaged therefrom during a part of the forward traverse of the said carriage, a rack on said carriage, a pinion in the path of said rack and meshing therewith when the carriage reaches a given point in its forward traverse, and speed-multiplying connections between said pinion and said driver for moving the driver axially, with a lug or projection eccentrically connected to said pinion, and a bar connected with said carriage and coacting with said lug to prevent rotation of said pinion until the carriage reaches said given point, substantially as described.

34. The combination of type-writing mechanism having a carriage moved step by step for letter-spacing, adding mechanism, a driver controlled and operated by type-operating mechanism and operating said adding mechanism, said adding mechanism and said driver being movable one past or before the other, and mechanism for preventing said driver from operating said adding mechanism until the type-writer carriage shall have reached a given point in its forward traverse, substantially as described.

35. The combination with type-operating keys and a carriage, of adding mechanism, a driver for independently operating each element of the adding mechanism, connections between said driver and said carriage for moving the driver in one direction from element to element of the adding mechanism, and connection from certain of the keys for moving said driver variable distances in another direction to operate said adding mechanism, substantially as described.

36. The combination of type-operating keys, a platen, independently-operable adding-wheels, a driver for said wheels movable independently in two directions and connected with said wheels one at a time beginning at a predetermined point of the letter-spacing, and two independent connections between said keys and said driver for moving the driver in a step-by-step manner in one direction and for moving it variable distances in the other direction to operate said wheels, substantially as described.

37. The combination of a type-writer mechanism having a step-by-step moving carriage, adding mechanism, a rotatory and sliding driver for actuating said adding mechanism, connections with type-operating mechanism for rotating said driver, and mechanism for connecting said driver with the carriage at a predetermined point in the forward traverse of said carriage and moving said driver axially into engagement with said adding mechanism, substantially as described.

38. The combination of type mechanism, a carriage, independently-operable adding-wheels, a rotatory and axially-movable driver for said wheels disconnected therefrom during a part of the forward movement of the carriage, mechanism connecting said driver with type-operating mechanism and rotating at variable distances, and means for moving the driver axially to bring the same into operative relation with said wheels one at a time after the carriage reaches a predetermined point in its forward progress, substantially as described.

39. The combination of type mechanism, a carriage, independently-operable adding-wheels, a rotatory driving-pinion for said wheels disconnected therefrom during a part of the traverse of the carriage, a journaled shaft with which the pinion rotates and along which it is movable, mechanism connecting said shaft with type-operating mechanism for rotating the shaft variable distances, and means for moving said driver along said shaft and connecting it with said wheels in succession after the carriage has reached a predetermined point in its forward traverse, substantially as described.

40. The combination of type mechanism, a carriage, independently-operable adding-wheels, a driving-pinion for said wheels disconnected therefrom during a part of the traverse of the carriage, a shaft with which the pinion rotates and along which it moves, mechanism connecting type-writing mechanism with said shaft for rotating it variable distances, and mechanism for connecting said driving-pinion with the carriage after the latter has reached a predetermined point and with said adding-wheels in succession, substantially as described.

41. The combination of type mechanism, having a carriage, independently-operable adding-wheels, a driver-pinion for said wheels disconnected therefrom during a part of the traverse of the carriage, a shaft with which the pinion turns and along which it may move, speed-multiplying mechanism intermediate said driver-pinion and the carriage thrown into operation at a predetermined point in the forward traverse of said carriage and moving said pinion along the shaft, means for connecting said driver-pinion with said adding-wheels one at a time, and means for connecting type-operating mechanism with said shaft and giving it a variable throw, substantially as described.

42. The combination with type-operating mechanism and a platen one of which moves for letter-spacing, of a series of independently-rotatable adding-wheels, independently-rotatable gears for rotating said wheels, and a pinion movable in the direction of its axis and controlled by type-operating mechanism for operating said independent gears one by one and brought into mesh with the first gear thereof at a predetermined point in the forward traverse of the moving element of said type-writing mechanism, with mechanism for discontinuously connecting said pinion with said moving element, substantially as described.

43. The combination with type-operating mechanism and a platen one of which moves for letter-spacing, of a series of adding-wheels independently rotatable on the same shaft, a series of independently-rotatable gears connected therewith to rotate the same independently, a driving-pinion adapted to mesh with said independent gear one by one and to be out of engagement therewith during the first part of the traverse of the moving element of the printing mechanism, mechanism controlled by type-operating mechanism for rotating the said driving-pinion variable distances, and mechanism thrown into operation during the latter part of the traverse of said moving element of the printing mechanism for moving said operating-pinion in a step-by-step manner into mesh with and from one to another of said independent gears, substantially as described.

44. The combination of type mechanism, a carriage, independently-rotatable adding-wheels, gears for independently rotating said wheels, an axially-movable driving-pinion for operating said independent gears one by one and brought into mesh with the first gear thereof at a predetermined point in the forward traverse of the carriage, connections between type-operating mechanism and said driving-pinion for giving the latter a variable throw, and connections between said carriage and said driving-pinion for moving the pinion axially, and said connections being inoperative until and thrown into action when the carriage reaches a predetermined point in its forward traverse, substantially as described.

45. The combination of type mechanism, a carriage, independently-operable adding-wheels, a driving-pinion, a shaft with which said pinion rotates and along which it moves, mechanism intermediate type-operating mechanism and said shaft for rotating the shaft variable distances, and mechanism intermediate the carriage and the driving-pinion and discontinuously connected with one of said parts for bringing the driving-pinion into mesh with the adding-wheel-operating gears one by one and with the first gear thereof at a predetermined point in the forward traverse of the carriage, substantially as described.

46. The combination of type mechanism, a carriage having a uniform step-by-step feed for letter-spacing, independently-operable adding-wheels, independent gear for operating said wheels placed at a uniform distance from center to center greater than the uniform feed of the carriage, a driving-pinion movable in the direction of its axis into mesh with and from one to another of said independent gears, speed-multiplying connections between said carriage and said driving-pinion for moving the pinion in the direction of its axis, said multiplying connections being inclusive of a rack upon the carriage and a pinion in mesh therewith, and mechanism controlled by type-operating mechanism for rotating said driving-pinion variable distances, substantially as described.

47. The combination of type mechanism, a carriage having a uniform letter-spacing feed, independently-operable adding-wheels, independent gears for rotating said wheels and placed at a uniform distance from center to center greater than the uniform letter-space feed of the carriage, a driving-pinion movable in the direction of its axis and out of mesh with said independent gears during a part of the forward traverse of the carriage, speed-multiplying mechanism between said carriage and said driving-pinion and thrown into operation at a predetermined point in the forward movement of the carriage and moving said driving-pinion axially into mesh with the first of said independent gears and from one to another thereof in succession, and mechanism intermediate type-operating mechanism and said driving-pinion for rotating the pinion variable distances, substantially as described.

48. The combination with type mechanism and a platen one of which moves uniform distances for letter-spacing, of independently-operable adding-wheels at a uniform distance apart from center to center greater than the uniform letter-space feed, an axially-movable rotary driver for said wheels and connected with said adding-wheels one at a time, and two independent mechanisms controlled by type-operating mechanism for moving the driver axially step by step in one direction and connecting it with said adding-wheels as described and for giving the driver variable motion in a rotary direction, substantially as described.

49. The combination with type-operating mechanism and a platen-carriage, of a series of independently-rotatable adding-wheels, a series of gears independently rotatable and connected each with a corresponding adding-wheel, a driving-pinion adapted to mesh with said independent gears and disengaged therefrom during the first part of the motion of said carriage to the left, connections thrown into operation at a predetermined point by said carriage for moving said driving-pinion axially into mesh with and from one to another of said independent gears, and mechanism controlled by type-operating mechanism for variably rotating said driving-pinion in one direction, substantially as described.

50. The combination of type mechanism, a carriage, a series of independently-rotatable adding-wheels each having a gear 179 thereon, a series of independent gears 178, intermediate gears 181 connecting gears 178 with the gears 179, a driving-pinion 190 automatically and discontinuously connected to the carriage during a part of the forward movement of the carriage, the said automatic connection being effected by the forward run of the carriage, and the pinion 190 being adapted to mesh with said gears 178 one at a time and to be disengaged therefrom, connections between said carriage and said pinion 190 for moving the pinion 190 into mesh with the gears 178 in succession, and mechanism controlled by type-operating mechanism for rotating said pinion 190 variably, substantially as described.

51. The combination of a series of adding-wheels, a series of independent gears 178 connected to and rotating said adding-wheels, a driving-pinion having a step-by-step motion into mesh with and from one to another of said pinions 178, a reciprocating frame connected with said driving-pinion for rotating the same, and a series of cams for moving said reciprocating frame variable distances, type-writing mechanism, and means for moving said driving-pinion endwise and for operating said cams, substantially as described.

52. The combination with type-operating mechanism, a platen-carriage, independently-operable adding-wheels, gears connected therewith and operating the same, an axially-movable driver-pinion, mechanism in-

terrediate said driver-pinion and the carriage including a rack on the carriage and a pinion on the frame disengaged from the rack during a part of the forward movement of the carriage, a locking-bar on said carriage, and a locking-leg connected with said pinion on the frame for preventing the rotation of said pinion before its engagement with said rack, with means for rotating said driver-pinion variable distances, substantially as described.

53. The combination with type-operating keys, a platen-carriage and adding mechanism, of mechanism for operating said adding mechanism and disengaged therefrom during a part of the forward movement of the carriage and said operating mechanism being partly operated by certain of the keys and partly by the carriage, and locking mechanism for said operating mechanism controlled by the carriage, substantially as described.

54. The combination of type mechanism, a carriage, adding mechanism, a driver for operating said adding mechanism and disengaged therefrom during a part of the forward motion of said carriage, a rack on said carriage, a pinion in the path of said rack with which the said rack meshes at a predetermined point in the forward motion of said carriage, mechanism intermediate said pinion and said driver for moving the driver in the direction of its axis of motion, a lug or projection connected and eccentrically placed with relation to said pinion, a locking-bar connected with said carriage and coacting with said lug to prevent rotation of said pinion until the carriage reaches said point, and means controlled from the keyboard for rotating said driver, substantially as described.

55. The combination of type mechanism, a carriage, adding-wheels and operating-gears therefor placed at a uniform distance from center to center greater than the letter-space feed of said carriage, an axially-movable driving-pinion which is disengaged from said adding-wheel gear during a part of the forward motion of the carriage, a reciprocating rack to which said driving-pinion is connected and by which it is moved axially, a large pinion engaging said rack, a shaft carrying said pinion, a smaller pinion on said shaft, a short rack on the carriage for engaging with said smaller pinion at a predetermined point in the forward motion of the carriage, and a lug connected with and eccentrically placed with relation to said shaft or smaller pinion, a bar on said carriage coacting with said lug to lock the shaft against rotation until said short rack is in mesh with said pinion, and means controlled from the keyboard for rotating said driving-pinion variable distances, substantially as described.

56. The combination with type mechanism, a carriage, and carriage release and stop mechanism adapted to release the carriage at any point and to arrest it at different distances from a predetermined point, of adding mechanism, and operating means for said adding mechanism disengaged therefrom during a part of the forward motion of said carriage and controlled partly from the keyboard and partly by said carriage, substantially as described.

57. The combination with type mechanism, a carriage and carriage release and stop keys adapted to coact with said carriage to release the same at any point and to arrest it at different distances from a given point, of adding mechanism, and operating means therefor disengaged therefrom during a part of the forward motion of said carriage and controlled partly from the keyboard and partly by said carriage, substantially as described.

58. The combination of type-writing mechanism including a carriage having uniform letter-space feed, independently-operable adding-wheels arranged side by side in a frame, independent pinions for operating said wheels placed at uniform distances from center to center greater than the uniform letter-space feed, an axially-movable driving-pinion, speed-multiplying connections between said carriage and said pinion for moving the pinion axially step by step into mesh with said pinions singly in succession, mechanism controlled from the keyboard for rotating said driving-pinion variable distances, and means for moving said adding mechanism into two positions in one of which the adding mechanism is operated by said driving-pinion and in the other of which the driving-pinion is not operatively connected with said mechanism, substantially as described.

59. In a type-writing machine, the combination with type-operating mechanism including a carriage having uniform letter-space feed, independently-operable adding-wheels, pinions connected therewith for rotating the same independently and placed at a uniform distance from center to center greater than the uniform letter-space feed, an axially-movable driving-pinion, speed-multiplying connections between said carriage and said pinion for moving the latter axially into mesh with said pinions singly in succession, mechanism controlled from the keyboard for rotating said driving-pinion variable distances, and means for moving said adding mechanism into two positions in one of which it may be operated by said driving-pinion and in the other of which it is not operated thereby, substantially as described.

60. The combination of type mechanism, a power-driven escapement-controlled carriage, adding mechanism normally disconnected from the carriage but adapted to be brought in coöperative relation with said carriage and type mechanism at a given point in the forward traverse of the carriage, mechanism for releasing said carriage, and a variable stop mechanism for arresting said carriage at different distances from a predetermined point, substantially as described.

61. The combination of type mechanism, a power-driven escapement-controlled carriage, adding mechanism normally disengaged from the carriage but adapted to be brought into coöperative relation with said mechanism and carriage at a given point in the forward traverse of the carriage, a mechanism for releasing said carriage from the control of said escapement, and a series of stops at letter-space distances apart for arresting said carriage at different distances from a predetermined point, substantially as described.

62. The combination of a type mechanism, a power-driven escapement-controlled carriage, adding mechanism normally disengaged from said carriage but adapted to be brought into coöperative relation therewith and with said type mechanism at a given point in the forward traverse of said carriage, a mechanism for releasing said carriage, and a series of stops equal in number at least to the number-carriers of the adding mechanism representing units, tens, hundreds, &c., and adapted to arrest said carriage at different distances from a predetermined point, substantially as described.
